LYNNWOOD LINK EXTENSION

FINAL ENVIRONMENTAL IMPACT STATEMENT

SOUNDTRANSIT

U.S. Department of Transportation
Federal Transit Administration

APRIL 2015

SOUNDTRANSIT

April 1, 2015

Dear Recipient:

The U.S. Department of Transportation Federal Transit Administration (FTA) and Sound Transit (the Central Puget Sound Regional Transit Authority) have prepared this Final Environmental Impact Statement (Final EIS) on the proposed Lynnwood Link Extension light rail transit project. This project is part of Sound Transit 2, the Regional Transit System Plan for Central Puget Sound. Sound Transit is the project proponent.

The Final EIS has been prepared pursuant to the National Environmental Policy Act (42 U.S.C 4321 to 4370e) and the State Environmental Policy Act (Ch 43.21C RCW). It has been prepared to inform the public, agencies and decision makers about the environmental consequences of building and operating the Lynnwood Link extension of the light rail system from Northgate in Seattle to Mountlake Terrace, Shoreline, and Lynnwood along the Interstate 5 corridor. The Final EIS examines project route and station alternatives, including the preferred alternative identified by the Sound Transit Board.

The major choices for the project involve the route and profile of the light rail line and station locations. The Sound Transit Board will consider the alternatives evaluated in the Final EIS, public and agency comments on the Draft EIS, and other information before selecting the route and station locations to be built. After the Board selects the project to be built, FTA will issue a Record of Decision, which will state FTA's decision on the project and list mitigation commitments to reduce or avoid impacts.

The Final EIS includes a separately bound Summary, appendices, conceptual design drawings, technical reports, background materials, and responses to comments on the Draft EIS. Please see the Fact Sheet of this Final EIS regarding how to obtain these documents and who to contact for further information about the Final EIS.

Sincerely,

Steve Kennedy

Fact Sheet

Proposed Action

The Central Puget Sound Regional Transit Authority (Sound Transit) is proposing to expand the regional light rail system north from Seattle to Lynnwood, Washington. The proposed light rail extension, called the Lynnwood Link Extension (formerly known as the North Corridor Transit Project), would be within the cities of Seattle and Shoreline in King County and in Mountlake Terrace and Lynnwood in Snohomish County. The financing for the proposed project was approved by voters as part of the Sound Transit 2 (ST2) Plan in 2008 (Sound Transit, July 2008).

The proposed project, which is part of a larger regional network of light rail proposed under the ST2 program, would begin at Northgate in north Seattle and end at the Lynnwood Transit Center. The 8.5-mile-long project corridor generally follows Interstate 5 (I-5), which is the major north-south route through the state and serves a large commuter market traveling between Snohomish and King counties. The transportation corridor I-5 serves is bounded by Puget Sound to the west and Lake Washington to the east.

This Final Environmental Impact Statement (EIS) evaluates a No Build Alternative, a Preferred Alternative for light rail, and several other light rail alternatives. The alternatives are arranged in three geographic segments: Segment A—Seattle to Shoreline, Segment B—Shoreline to Mountlake Terrace, and Segment C—Mountlake Terrace to Lynnwood. The Preferred Alternative has both at-grade and elevated sections, with stations at NE 145th Street and NE 185th Street in Shoreline, at 236th Street SW in Mountlake Terrace, and at the Lynnwood Transit Center in Lynnwood. The other light rail alternatives include both at-grade and elevated alignments with different station locations and configurations. In total, seven alternatives are evaluated in Segment A, four alternatives are evaluated in Segment B, and four alternatives are evaluated in Segment C.

Cost of Document and Availability for Review and/or Purchase

This Final EIS is available to the public in a variety of formats and locations. It is available on the Sound Transit Web site (www.soundtransit.org/lle) and on compact disk (CD) at no cost. The CD includes all Final EIS appendices and technical reports. Paper copies are available for the cost listed below, which does not exceed the cost of reproduction:

- Summary – FREE
- Final EIS – $25.00
- Technical Reports – $15.00 each

Paper copies of these documents are available for review or purchase at the offices of Sound Transit, Union Station, 401 South Jackson Street, Seattle, Washington 98104. To request any of the documents, please contact Lauren Swift at (206) 398-5301. To review them, please call the Sound Transit librarian at (206) 398-5344 weekdays from 8:00 am to 5:00 pm to arrange an appointment.

Paper and CD copies of the Final EIS documents are also available for review at the following public places:

Appeals

Washington State Environmental Policy Act (SEPA) challenges to this Final EIS are governed by Sound Transit Resolution R7-1 and the SEPA rules and regulations (Ch. 43.21C RCW and WAC 197-11-680). Sound Transit Resolution R7-1 is available online at: http://www.soundtransit.org/About-Sound-Transit/Board-of-Directors/Board-archives/Resolutions-archive.xml (1994-1997 Resolutions).

As provided in Resolution R7-1, appeals of SEPA determinations must be made in writing by filing a letter of appeal and paying the required fee within 14 days following the date the environmental document is issued under SEPA. Letters of appeal should be addressed to Joni Earl, Chief Executive Officer, Sound Transit, Union Station, 401 South Jackson Street, Seattle, Washington 98104-2826.

For this Final EIS, appeals must be received by Sound Transit on or before 5:00 p.m. on April 15, 2015. Additional details about the appeals process and requirements are set out in Resolution R7-1 and in the SEPA rules and regulations.

SUMMARY

S.1 LYNNWOOD LINK EXTENSION

The Central Puget Sound Regional Transit Authority (Sound Transit) is proposing to build and operate the Lynnwood Link Extension, which would expand the regional light rail system from Seattle north to Lynnwood in Washington State. The proposed project would be in the cities of Seattle and Shoreline in King County and in Mountlake Terrace and Lynnwood in Snohomish County.

The Lynnwood Link Extension is a step in implementing the Puget Sound Regional Council's (PSRC) VISION 2040 (PSRC 2009) and the Sound Transit Regional Transit Long-Range Plan (Sound Transit Long-Range Plan) (Sound Transit 2005a, updated 2014), both of which call for the eventual extension of mass transit service beyond Lynnwood to Everett. The project would implement the Sound Transit 2 (ST2) Plan of regional transit investments. The ST2 projects included light rail from the Northgate Transit Center to the Lynnwood Transit Center, with intermediate stations serving north Seattle, Shoreline, and Mountlake Terrace.

Sound Transit and the Federal Transit Administration (FTA) have prepared this Final Environmental Impact Statement (EIS) in compliance with the National Environmental Policy Act (NEPA) and the Washington State Environmental Policy Act (SEPA). FTA is the federal lead agency under NEPA, and Sound Transit is the state lead agency under SEPA. The Draft EIS was released in July 2013, followed by a 60-day public comment period. After considering the Draft EIS, along with public and agency comments, the Sound Transit Board of Directors identified a Preferred Alternative. The Final EIS describes the Preferred Alternative for the proposed project, updates the analysis of environmental impacts for the Preferred Alternative and all other alternatives, describes proposed mitigation measures, and responds to comments Sound Transit and FTA received on the Draft EIS.

S.1.1 Project Area

The proposed Lynnwood Link Extension would begin at Northgate in north Seattle and end at the Lynnwood Transit Center (Figure S-1). The project would be about 8.5 miles long, generally following Interstate 5 (I-5), the major north-south route through the state. This corridor is in one of the most densely developed urban areas in the Pacific Northwest and is part of a longer north-south commuter corridor connecting Tacoma, Seattle, and Everett. Roadways in this corridor are heavily congested during peak travel periods. Congestion is expected to worsen as the region accommodates 20 percent more people and nearly 40 percent more jobs through 2040.

The Lynnwood Link Extension would connect to Central Link, the spine of the regional light rail system. The initial sections of Central Link are already operating between downtown Seattle and Seattle-Tacoma International Airport. Light rail sections from downtown Seattle to the north are under construction. Sound Transit expects University Link from downtown Seattle to the University of Washington to open in 2016 and the extension to Northgate in 2021. Overall, the projects in the ST2 program include nearly 36 new miles of service to the north, south, and east, resulting in 55 miles of light rail.

S.2 PURPOSE AND NEED FOR THE LYNNWOOD LINK EXTENSION

The purpose of the Lynnwood Link Extension is to expand the Sound Transit Link light rail system from Northgate in Seattle north into Shoreline, Mountlake Terrace, and Lynnwood in Snohomish County in order to:

- Provide reliable, rapid, and efficient peak and off-peak two-way transit service of sufficient capacity to meet the existing and projected demand for travel to and from the corridor communities and other urban centers in the central Puget Sound area.
- Create an alternative to travel on congested roadways and improve regional multimodal transportation connections.
- Support the adopted land use, transportation, and economic development plans of the region and the corridor communities.
- Advance the long-range vision, goals, and objectives for transit service established by the Sound Transit Long-Range Plan for high-quality regional transit service connecting major activity centers in King, Pierce, and Snohomish counties.
- Implement a financially feasible system that seeks to preserve and promote a healthy environment.

The project is needed to:

- Address increasingly unreliable travel times for transit trips that now rely on the corridor's highly congested roadways.
- Address overcrowding caused by insufficient transit capacity.
- Create a reliable alternative to automobile trips on I-5 and State Route (SR) 99, the two primary highways serving the project corridor, which are unreliable and over capacity throughout large portions of the day.
- Increase mobility, access, and transportation capacity for the 20 percent growth in population and 40 percent growth in employment projected in the regional growth and activity centers in the corridor and the region, consistent with PSRC's VISION 2040 and Transportation 2040, as well as related county and city comprehensive plans.
- Create the transit infrastructure needed to support the development of Northgate and Lynnwood—the corridor's two designated regional growth centers.

- In design

Figure S-1. Regional Setting

- Advance the long-range vision of the Sound Transit Long-Range Plan for a future extension of mass transit north to Everett.
- Ensure long-term regional mobility, multimodal connectivity, and convenience for the corridor's citizens and communities, which include travel-disadvantaged residents and low-income and minority populations.
- Help the state and region reduce transportation-related energy consumption and decrease harmful greenhouse gas emissions in the atmosphere.

S.3 ALTERNATIVES

This section describes the alternatives evaluated in the Lynnwood Link Extension Final EIS. The alternatives are a No Build Alternative, the Preferred Alternative, and several other light rail alternatives, presented by project segment.

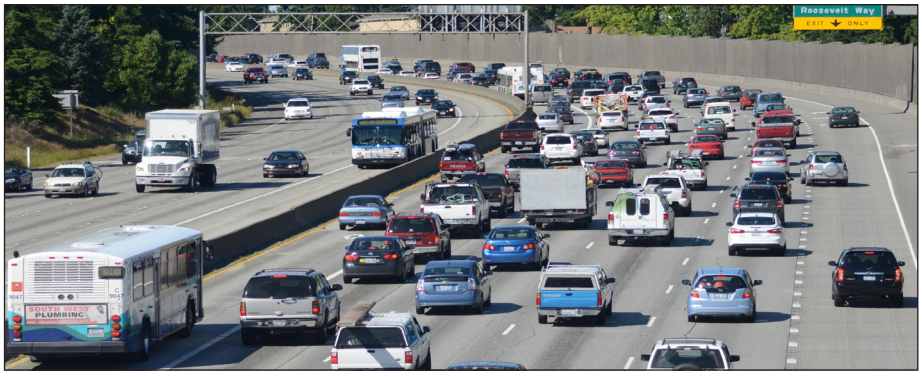
S.3.1 No Build Alternative

The No Build Alternative represents the anticipated transportation system without the Lynnwood Link Extension. It includes other committed transportation projects identified in the Metropolitan Transportation Plan adopted by PSRC in 2010 (Transportation 2040). It also assumes growth in regional population and employment through 2035. Under the No Build Alternative, Sound Transit would still build and operate the Northgate Link Extension, East Link Extension to Overlake in Redmond, South 200th Link Extension, Federal Way Link Extension to approximately Highline Community College, and the Link Operations and Maintenance Satellite Facility (OMSF), as authorized in the ST2 program.

S.3.2 Light Rail Alternatives

The light rail alternatives are grouped in three geographic segments—A, B, and C—as shown in Figure S-2, which also highlights the Preferred Alternative. The alternatives generally follow the I-5 corridor from the Northgate Transit Center in Seattle to the Lynnwood Transit Center. Figures S-3 through S-10, included later in this section, depict the alignments and stations for each segment.

The Preferred Alternative identified by the Sound Transit Board in November 2013 has a mix of at-grade and elevated sections that run along the east side of I-5 from the Northgate Transit Center to the Mountlake Terrace Transit Center. It then crosses to the west side of I-5, where it runs at-grade until 220th Street SW in Mountlake Terrace. It is then elevated along the west side of I-5 until it approaches the Lynnwood Transit Center and park-and-ride, where it angles northeast to a station adjacent to the Lynnwood Transit Center. The four stations for the Preferred Alternative would be at NE 145th Street, NE 185th Street, the Mountlake Terrace Transit Center, and the Lynnwood Transit Center. (The Final EIS also reviews options for additional stations at NE 130th Street and at 220th Street SW.) About 1,500 new park-and-ride spaces are planned, with about 500 spaces added at each of the stations except at the Mountlake Terrace Transit Center, which would maintain its current level of parking.



I-5 north of Northgate in Seattle

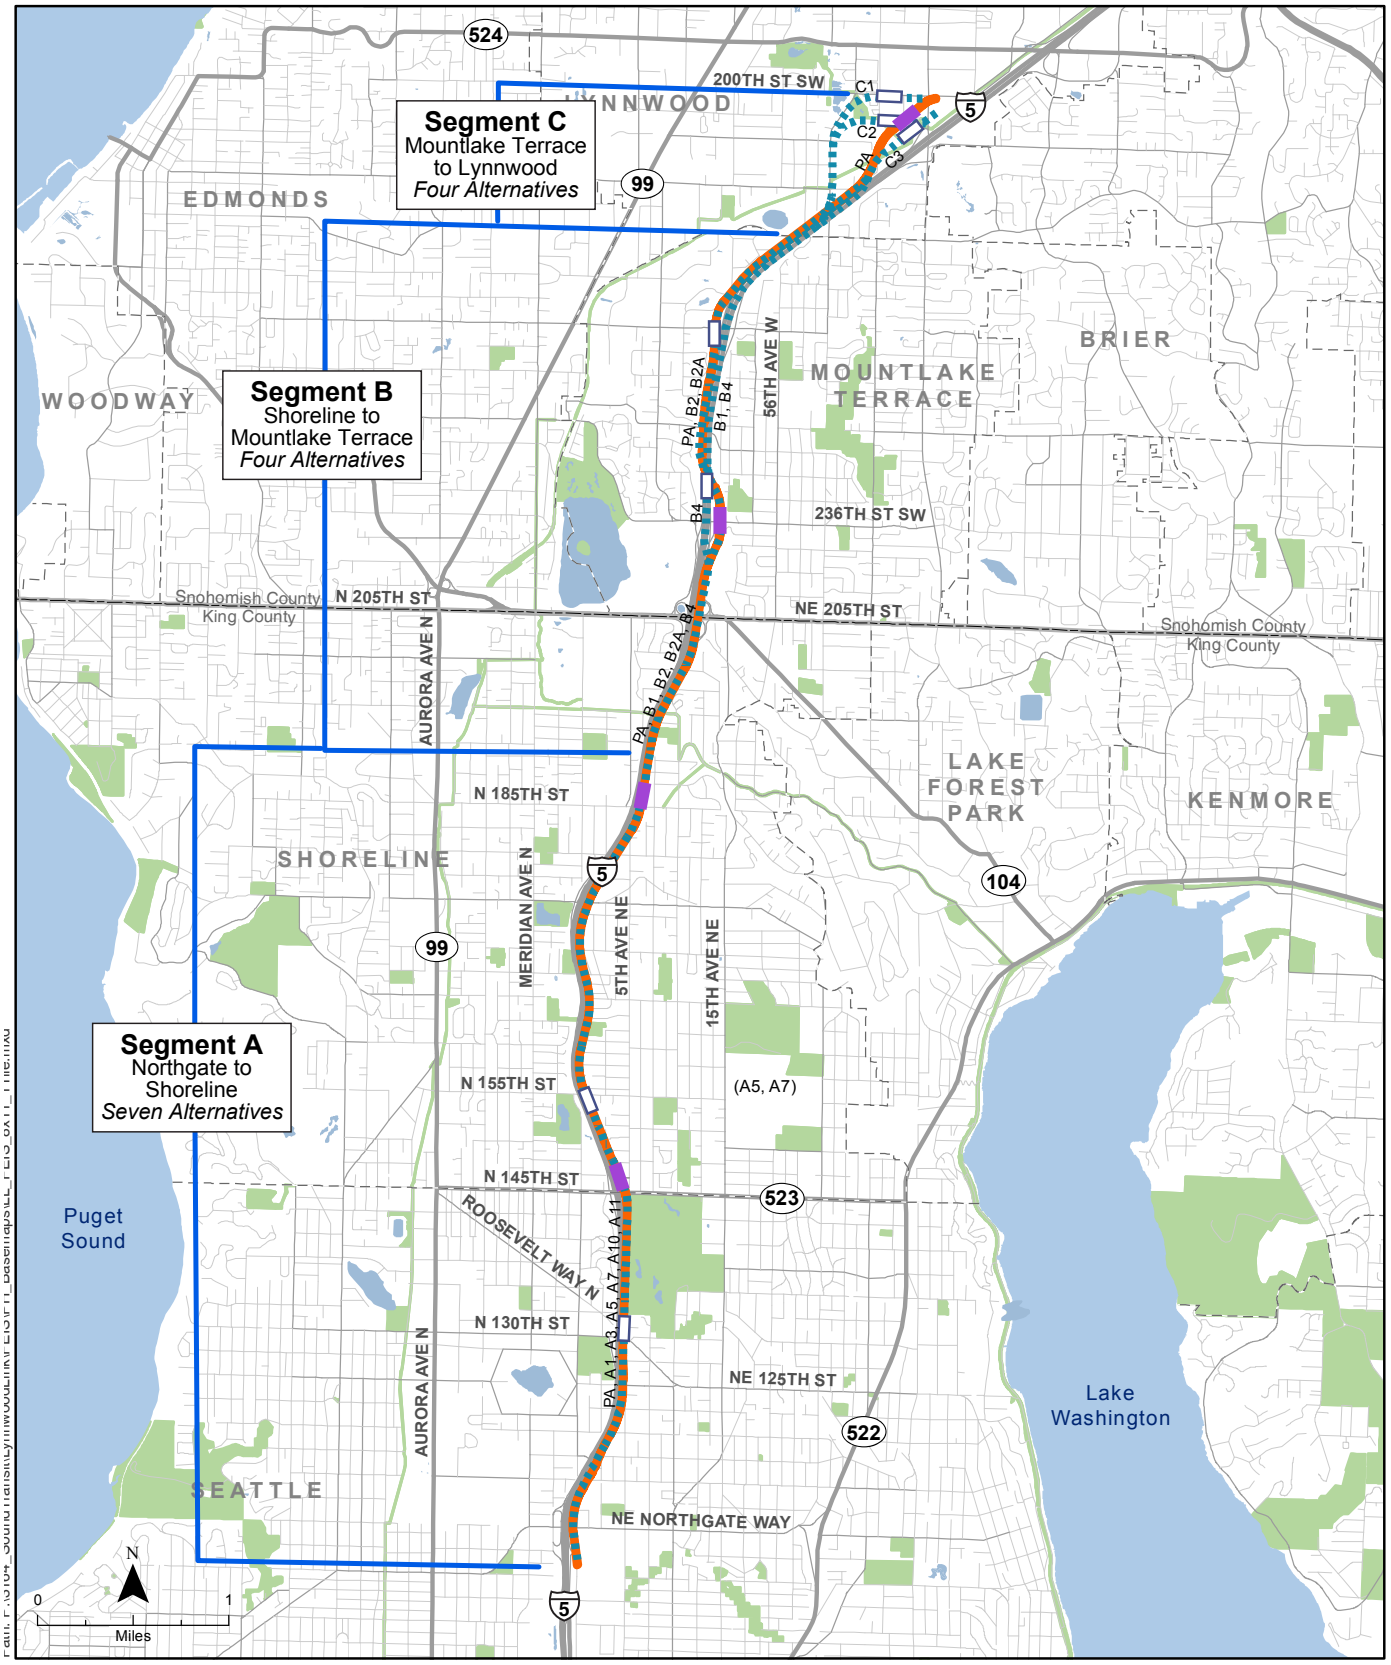


Figure S-2. Alternatives by Segments

Common features of the alternatives Sound Transit is evaluating are described below. Light rail trains would operate revenue service (carry passengers) weekdays between 5:00 am and 1:00 am daily, running as often as every 4 minutes each way during peak periods, and every 7.5 minutes in the early morning or late at night.

The alternatives present a variety of ways Sound Transit could approach the design, construction, and operation of the proposed project. They show how light rail could be developed mostly adjacent to I-5 and how the profile for light rail might vary based on existing conditions, such as bridges, interchanges, and other infrastructure and environmental or community features. They reflect how topography and various station choices affect alignment decisions, and they illustrate different ways light rail could cross I-5 to ultimately reach the project's terminus station in Lynnwood.

At-grade or Elevated Profiles: While all of the alternatives would have light rail in an exclusive right-of-way (separated from other traffic), some are mostly at-grade and others are mostly elevated. These choices are largely related to existing transit facilities, topography, right-of-way, and freeway features such as interchanges and bridges. At-grade alternatives can have the advantage of lower construction and operating costs compared with elevated alternatives, but they can require rebuilding bridges, ramps, or interchanges, which can increase costs and impacts. At-grade alternatives can also result in some property or environmental impacts

At-grade Light Rail Train

Elevated Light Rail Train with Overhead Catenary Wires

that could be reduced or avoided by an elevated alternative. However, elevated alternatives can cause more noise and visual impacts than at-grade alternatives.

Number and Location of Stations: The alternatives offer choices in station locations and profile (at-grade or elevated), and in parking and access. At-grade stations are generally less expensive to construct and operate, while elevated stations can have a smaller footprint and other elements beneath them.

Parking Facilities: The alternatives present several ways for the proposed project to address the need for parking. The approach varies by station location along the proposed project's length; at each station, the parking facilities and supply reflect factors such as expected demand, street and freeway access, urban settings, site constraints, and local plans. The project would increase corridor parking capacity by 1,500 to 1,900 spaces.

SEGMENT A: SEATTLE TO SHORELINE

Segment A has seven alternatives connecting Northgate in Seattle to NE 185th Street in Shoreline, all on the east side of I-5. These alternatives differ from each other in three key ways: the extent to which they are at-grade or elevated, the number of

stations (two versus three), and the locations of stations. Some stations also feature park-and-rides with different parking options. Figures S-3 through S-6 show the alignments and stations for each of the Segment A alternatives.

Key Characteristics of the Segment A Alternatives

	PA	A1	A3	A5	A7	A10	A11
Profile							
Mostly At-grade	•	•		•		•	
Mostly Elevated			•		•		•
Stations*							
130th				G	E	G	E
145th	E	E	E			E	E
155th				E	E		
185th	G	G	E	G	E	G	E

*E = Elevated; G = At-grade

Preferred Alternative (At-grade/Elevated with NE 145th and NE 185th Stations). The Preferred Alternative (Figure S-3) combines at-grade and elevated sections, with stations at NE 145th Street and NE 185th Street. It is based largely on Alternative A1 from the Draft EIS, but incorporates several of the more effective design approaches explored in other Draft EIS alternatives. It is elevated from the Northgate Station to about NE 115th Street, and then stays mostly at-grade except for sections between NE 130th Street through NE 145th Street, and at NE 155th Street and NE 175th Street. The design also includes measures to maintain access for the Seattle Latvian Evangelical Lutheran Church. (Access to the church has been maintained in revisions to other alternatives as well.) Other key elements include a shift east around the NE 117th Street bridge at I-5; reconstruction of the NE 130th Street interchange, overpass, and 5th Avenue NE; a revised ramp at the NE 145th Street interchange; realignments for sections of 1st Avenue NE in Seattle and Shoreline; realignments of sections of 5th Avenue NE and 7th Avenue NE in Shoreline, and modification of the NE 185th Street overpass. The Preferred Alternative in Segment A also relocates existing traffic noise walls, generally to the east of the light rail guideway. The Final EIS also evaluates two options: a station at 130th Street NE, and a parking garage for the NE 185th Street Station on a parking lot at Shoreline Stadium.

Alternative A1: At-grade/Elevated with NE 145th and NE 185th Stations. Alternative A1 (Figure S-3) connects to the light rail guideway of the Northgate Link Extension near NE 104th Street. It is elevated from Northgate until about NE 115th Street, and then stays mostly at-grade except for sections between NE 130th Street and NE 145th Street, and at NE 155th Street and NE 175th Street. In addition to the stations shown on Figure S-3, key features include a replaced NE 117th Street bridge over I-5; a reconfigured NE 130th Street interchange; realignments for parts of 1st Avenue NE, 5th Avenue NE, and 7th Avenue NE in Shoreline; and a replaced NE 185th Street bridge over I-5.

Alternative A3: Mostly Elevated with NE 145th and NE 185th Stations. Alternative A3 is similar to Alternative A1, but the alignment is mostly elevated, except from about NE 150th Street to about NE 173rd Street. This alternative features different station configurations at its NE 145th Street and NE 185th Street Stations (see Figure S-4). It avoids the NE 117th Street bridge by crossing over the road and to the east, and it modifies the ramps at the NE 145th Street interchange.

Alternative A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations. Alternative A5 is largely based on Alternative A1, except that it has stations at NE 130th and NE 155th Streets (instead of a station at NE 145th Street), and with a different option for a NE 185th Street Station (see Figure S-4). Other key elements include a shift east around the NE 117th Street bridge at I-5, changes at the NE 130th Street interchange, and realignments for parts of 1st Avenue NE and 7th Avenue NE in Shoreline.

Alternative A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations. Alternative A7 combines station choices similar to Alternative

Alternative A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations. Alternative A10 is based on Alternative A1 but with three stations, and different station configurations and parking options, as shown on Figure S-5.

Alternative A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations. Alternative A11 is based on Alternative A3 but adds the NE 130th Street Station (see Figure S-6).

SEGMENT B: SHORELINE TO MOUNTLAKE TERRACE

Four alternatives are proposed for Segment B from NE 185th Street in Shoreline to 212th Street SW in Mountlake Terrace. All alternatives begin on the east side of I-5 and end either in the I-5 median or on the west side of I-5. These alternatives have at-grade and elevated sections along their alignment, but all are elevated as they enter Mountlake Terrace. After that, the median alignments are generally at-grade while the west side alignments are both at-grade and elevated. Three of the alternatives feature a station at the existing Mountlake Terrace Transit Center and park-and-ride (NE 236th Street), while one places a station at the Mountlake Terrace Freeway Station in the I-5 median. One alternative also features an additional station at 220th Street SW. Figures S-7 and S-8 show the Segment B alternatives.

Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side. The Preferred Alternative begins north of the NE 185th Street Station and proceeds in a retained cut along the east side of I-5 (see Figure S-7). It crosses below a replaced NE 195th Street pedestrian bridge and then becomes elevated as it enters the valley that includes the SR 104/NE 205th Street/Ballinger Way interchange, and it continues elevated to a station on the east side of the Mountlake Terrace Transit Center. North of the station, it crosses over all I-5 lanes to the west side of I-5 (refining Alternative B2 in the Draft EIS), where it continues north until it

Figure S-7. Preferred Alternative and Alternative B1

crosses over 220th Street SW and the I-5 freeway ramps, which would be modified. It then descends to follow the east side of 60th Avenue West, and runs mostly on retained cut and fill structures along the west side of I-5 before finishing with an elevated guideway over 212th Street SW. The Preferred Alternative has an optional elevated station with a 200-space park-and-ride south of 220th Street SW. This would shift the alignment slightly west and avoid modifying the I-5 on-ramps and off-ramps at 220th Street SW.

Transit Center	•	•	•	
Freeway Station				•
Alignment North of Mountlake Terrace Station				
Freeway Median		•		•
West side	•		•	
Additional Station at 220th Street SW			•	

Alternative B1: East Side to Mountlake Terrace Transit Center to Median. Alternative B1 begins north of the NE 185th Street Station and would be either in a retained cut or elevated guideway along the east side of I-5, depending on its Segment A connection (see Figure S-7). It crosses below a replaced NE 195th Street pedestrian bridge and then is largely elevated to a station on the east side of the Mountlake Terrace Transit Center. It then crosses over the northbound lanes of I-5, enters the freeway median, and drops to at-grade. The alignment continues at-grade in the median of I-5, generally at the level of the southbound I-5 lanes, north to approximately 212th Street SW.

Alternative B2A: East Side to Mountlake Terrace Transit Center to West Side with 220th Street SW Station. Alternative B2A is similar to the Preferred Alternative, except it includes a station with a park-and-ride at 220th Street SW, as shown on Figure S-8. This configuration also would require modifying the on-ramps and off-ramps for I-5. The initial section of Alternative B2A from Segment A could also be either elevated or at-grade..

Alternative B4: East Side to Mountlake Terrace Freeway Station to Median. Alternative B4 (see Figure S-8) is the same as Alternative B1 from the NE 185th Street Station to about the Lake Ballinger Way/SR 104 interchange, where it crosses over to the I-5 median and under the 236th Street SW overpass to reach the Mountlake Terrace Freeway Station. North of the Mountlake Terrace Freeway Station, the Alternative B4 alignment is similar to Alternative B1.

SEGMENT C: MOUNTLAKE TERRACE TO LYNNWOOD

In Segment C, all alternatives depart from I-5 but use different alignments to reach the Lynnwood Transit Center, with different stations and park-and-ride options at the project's north terminus. Figures S-9 and S-10 show the Segment C alternatives, which are all elevated.

Figure S-10. Alternatives C2 and C3

Preferred Alternative: West Side to Lynnwood Transit Center Station. The Preferred Alternative is based on Alternative C3 with route and station modifications suggested by the City of Lynnwood and others during the Draft EIS comment period. From the end of Segment B at about 212th Street SW, the Preferred Alternative (see Figure S-9) continues elevated along the west side of I-5 until it passes over 52nd Avenue West. It leaves the side of I-5 and heads northeast at about 208th Street SW, crossing over the Interurban Trail right-of-way and Scriber Creek to reach a station straddling 48th Avenue West on the east side of the Lynnwood Transit Center. Past the station, tail tracks would extend over 44th Avenue West to the south side of 200th Street SW. Several streets serving the transit center would also be improved. The Preferred Alternative also has an option to develop a second garage with an additional 400 net spaces.

Alternative C1: 52nd Avenue West to 200th Street SW Station. Alternative C1 (see Figure S-9) begins with two alignment options to connect with Segment B alternatives. Option 1 transitions from at-grade in the I-5 median (connecting to Alternative B1 or B4), and Option 2 continues elevated on the west side of I-5 (when connecting to the Preferred Alternative or Alternative B2A). Both are elevated along the east side of 52nd Avenue West and Cedar Valley Road. Alternative C1 turns east over the corner of Scriber Creek Park and runs along the south side of 200th Street SW to its elevated 200th Street SW Station, with tail tracks near 48th Avenue West.

Alternative C2: 52nd Avenue West to Lynnwood Transit Center Station. Alternative C2 and its options from I-5 are the same as Alternative C1 to 52nd Avenue West, but it turns northeast to cross south of Scriber Creek Park to a station south of the existing Lynnwood Transit Center (see Figure S-10). Tail tracks would extend beyond the station.

Alternative C3: Along I-5 to Lynnwood Park-and-Ride Station. Alternative C3 also features two options for connections to Segment B alternatives. At 208th Street SW, it crosses the Interurban Trail right-of-way and parallels I-5 to the Lynnwood Park-and-Ride Station south of 48th Avenue SW, east of the Lynnwood direct access ramp. Tail tracks would extend across 44th Avenue West. As shown in Figure S-10, the Lynnwood Station has two design options: one leaves the existing transit center as it is, and the other moves it next to the light rail station.

S.3.3 Construction

Sound Transit plans to start construction in 2018 and open the line for service by 2023. The light rail project would be built in sections, with major construction activities typically lasting approximately 2 years in any given area, although more complex elements such as stations, major structures, and systems would take longer. In addition to the right-of-way needed to build the alignments and stations, Sound Transit would also need areas to stage construction activities. Where possible, Sound Transit would locate construction staging areas on available right-of-way or on properties it would need to acquire for permanent facilities; however, other sites along the corridor would also be needed.

Elevated guideways, station areas, and retaining wall construction usually have the most intense construction activities because they are more complex and need greater volumes of materials, equipment, and workers. Some streets would be partially or fully closed to through traffic, but local access would be maintained. Short-term I-5 lane closures would be needed for bridging structures across I-5 or to set up barriers bordering construction areas. Trucks and heavy equipment would be used throughout much of the construction period. See Construction Impacts in Section S.5.1 below for more details about construction activities. Appendix F, Conceptual Plans, shows anticipated construction staging areas

S.4 ALTERNATIVES DEVELOPMENT

Sound Transit has built on several decades of previous planning and environmental review to define the alternatives described above. A light rail

connection between King County and Snohomish County was part of the 1996 Regional Transit System Plan and EIS (Sound Transit 1996), which resulted in Sound Transit's first system plan, the Sound Move program. The Sound Transit Long-Range Plan (adopted July 7, 2005) and its Final Supplemental EIS on the Long-Range Plan (June 2005) formed the basis for the ST2 Plan. The ST2 Plan identified the project that is now the Lynnwood Link Extension (Sound Transit 2005a, 2005b, 2008).

In 2010, Sound Transit conducted early scoping and an Alternatives Analysis that considered a broad range of alternatives for the project, including light rail and bus rapid transit alignments along I-5, SR 99, and other arterials in the project area. The September 2011 Alternatives Analysis Report and SEPA Addendum identified the most promising alternatives for further study in this EIS.

Sound Transit and FTA conducted environmental scoping for the EIS from September 30 through October 31, 2011. In December 2011, the Sound Transit Board approved Motion M2011-87, which directed Sound Transit to study light rail alternatives along I-5. The motion also removed from further consideration previously studied alternatives such as bus rapid transit and light rail alignments along SR 99 and 15th Avenue NE. Sound Transit then performed additional planning and analysis of light rail alternatives with station sites and alignments along I-5. In April 2012, the Board approved Motion M2012-17, which identified the alignment and station alternatives to be evaluated in the Draft EIS.

After considering the contents of the Draft EIS and public and agency comments, the Sound Transit Board identified the Preferred Alternative to be evaluated in the Final EIS along with other alternatives (Motion M2013-96, November 2013). The Preferred Alternative is largely based on Alternative A1, Alternative B2, and Alternative C3 as described in the Draft EIS, with modifications to improve benefits, lower costs, or reduce environmental impacts. Motion M2013-96 also directed Sound Transit to consider modifications and options for the Preferred Alternative and other alternatives, including maintaining access to the Seattle Latvian Evangelical Lutheran Church in Segment A; further studying the option for a station at 220th Street SW in Segment B; and realigning Alternative C3 to better connect with the Lynnwood Transit Center, preserve more redevelopable area, and minimize wetland and stream impacts.

In Segment C, all alternatives would cross an Edmonds School District property that is to be developed as a bus base and district operations center. The District's comment letter on the Draft EIS stated concerns about potential conflicts with its development plans for the property, but also supported a City of Lynnwood proposal to modify Alternative C3. The Preferred Alternative now features several elements of that proposal.

Chapter 2, Alternatives Considered, of the Final EIS describes the alternatives development process, including the alternatives Sound Transit previously removed from further consideration, the Sound Transit Board's directions for the Preferred Alternative, and other modifications and analyses incorporated within the Final EIS.

S.5 TRANSPORTATION EFFECTS

This section compares transportation conditions anticipated for the year 2035 with and without the light rail alternatives. For context, the project corridor is already highly congested. Travel on I-5 through the corridor currently takes up to three times longer during peak hours than at some other times. Average speeds during peak periods along I-5 now range from 18 miles per hour (mph) to 58 mph, which makes travel times highly variable and unpredictable. Vehicles in the HOV lanes move somewhat better, but HOV lanes are not continuous and peak period travel times for HOV lane users are still double those of the free-flow travel times (see Figure 3-2 in Chapter 3 of the Final EIS). By 2035, conditions on I-5 are

expected to worsen as more vehicles attempt to use the corridor during peak hours, which is already at 98 percent or more of its capacity. When demand is over capacity, operations break down even more.

Over 19,000 transit riders travel daily north and south on the I-5 corridor between Seattle and Lynnwood. Buses can use HOV lanes in some but not all sections. Travel times are not reliable, which is a major problem for both riders and transit operators.

S.5.1 TRANSIT RIDERSHIP, TRAVEL TIMES, AND SERVICE QUALITY

By 2035, between 63,000 and 74,000 transit trips are expected on the Lynnwood Link Extension each day, compared to about 34,000 bus trips under the No Build Alternative.

Transit travel times to regional destinations would be shorter and much more reliable with the Preferred Alternative or any of the other light rail alternatives. Trips to Northgate from Lynnwood would be up to 12 minutes faster, and trips to downtown Seattle from Lynnwood would be up to 16 minutes faster, than with the No Build Alternative in the morning peak period. In addition, the light rail alternatives would be safer, have more frequent service provide, more passenger capacity, and operate more reliably because the light rail would be separated from traffic.

The Lynnwood Station would be the busiest of the new light rail line, with approximately 17,000 to 18,000 boardings daily, depending on station options. In general, the different alignments would have similar ridership, but some of the station options would have more riders than others. In Segment A, the potential for three stations rather than two would slightly increase ridership, but forecasts indicate that three stations would generally reshuffle ridership that would otherwise still use the system with only two stations. In Segment B, the alternative using a freeway station at Mountlake Terrace would have fewer riders than the other three. While the median station would serve the same area, it would require longer walks, creating a longer total travel time for riders compared to a station at the transit center and park-and-ride. Adding a station in Segment B at 220th Street SW would slightly increase overall trips. Segment C has negligible differences in ridership among the stations.

REGIONAL TRAVEL

By 2035, ridership on any of the light rail alternatives would help reduce travel on roads in the region by more than 270,000 to 290,000 vehicle miles per day, compared with the No Build Alternative, and riders would save up to 25,000 hours in travel time daily.

AUTOMOBILE TRAVEL THROUGH THE PROJECT CORRIDOR

During the morning and evening peak hours, freeway travel times with the light rail alternatives would be similar to or slightly better than with the No Build Alternative in most locations. Freeway congestion and unreliable travel times would still occur.

FREEWAY OPERATIONS

With the No Build Alternative, freeway operations would worsen from today's already congested conditions. Depending on the location, traffic volumes in 2035 would increase 3 percent to 15 percent during peak periods. The average northbound PM peak period speeds would range from approximately 17 mph to 51 mph and are expected to be 35 mph or slower going southbound during the AM peak period. Demand for travel on the freeway would exceed capacity during the heaviest travel times.

The light rail alternatives would result in similar conditions in most locations, and congested conditions would still remain.

The Segment A light rail alternatives with a station at NE 145th Street (Preferred Alternative, A1, A3, A10, and A11) would slightly increase highway traffic and congestion in that interchange area compared to the No Build Alternative. The Segment A alternatives that would modify the NE 130th Street interchange would improve safety and

traffic flow (Preferred Alternative with or without the NE 130th Street Station Option, A1 and A10). The elevated alternatives with a station at NE 130th Street (A7 and A11) but with no changes to the interchange could result in slightly slower I-5 traffic near NE 130th Street.

Other interchanges and freeway conditions north of NE 145th Street to Lynnwood would likely not be appreciably affected by the light rail alternatives compared to the No Build Alternative.

ARTERIALS AND LOCAL STREETS

With the No Build Alternative in 2035, traffic volumes would increase by about 0.7 percent to 1.3 percent per year, which would cause delays at more of the intersections in the study area than compared to today. The light rail alternatives would draw more trips to station areas, which could increase intersection delays in some locations. However, Sound Transit would mitigate these impacts by adding turn lanes or modifying intersections.

In Segment A, the light rail alternatives would require mitigation to address congestion at two to seven intersections.

In Segment B, none of the light rail alternatives would worsen traffic conditions to levels that require mitigation.

In Segment C, the light rail alternatives would require mitigation to address congestion at three to four intersections.

OTHER TRANSPORTATION EFFECTS

Sound Transit also examined potential impacts on property access and circulation, nonmotorized facilities, parking, freight, and safety and found there would be no substantial impacts from the Lynnwood Link Extension. However, where interchange modifications are being considered at NE 130th Street, NE 145th Street, and 220th Street SW for the Preferred Alternative and several other alternatives, the Washington State Department of Transportation (WSDOT) and the Federal Highway Administration (FHWA) could restrict or modify local access as part of the WSDOT permitting process. Such local access changes could include restricted turn movements, driveway consolidation, alternative access for some properties, or property acquisitions. The potential for property impacts to occur is discussed in Section 4.1.

CONSTRUCTION IMPACTS ON TRANSPORTATION

Project construction would increase congestion and travel delays on I-5 and local streets. Sound Transit would typically have construction sites within the WSDOT right-of-way along I-5 and on local streets or acquired properties adjacent to the project corridor; trucks and equipment would need access to the construction areas. All the light rail alternatives would generate truck trips throughout much of the construction period to haul debris and deliver materials and equipment.

Construction would cause short-term lane closures or restrictions on I-5, particularly when light rail structures are being built over travel lanes or interchanges, or when ramps are being modified; some of the closures, while short term, would increase congestion and delays. For the Preferred Alternative and the other light rail alternatives that would rebuild I-5 overcrossings, closures of the crossing streets during construction would also require detours. The Preferred Alternative and the other alternatives that realign or reconstruct local streets would require closures and detours, some of which could last for several months. Building light rail structures above local streets would require short-term closures and detours.

In Segment A, the alternatives with a NE 130th Street Station (A5, A7, A10, and A11, as well as an option for the Preferred Alternative), or a NE 145th Street Station (the Preferred Alternative and A1, A3, A10, and A11) would have longer construction periods and more short-term I-5 lane or street closures and detours. Alternative A1 would reconstruct the NE 185th Street overpass, and the Preferred Alternative would modify the bridge to expand pedestrian/bicycle access; both

would have some short-term I-5 lane closures. In Segment B, the alternatives cross over part or all of I-5 but at different locations, which would necessitate short-term I-5 lane closures, including some periods with full closures northbound or southbound. In Segment C, all of the alternatives except the Preferred Alternative have an option to cross I-5 lanes from a median alignment, which would require short-term I-5 lane closures.

The alternatives that would place light rail stations or facilities at existing transit centers or park-and-rides would temporarily reduce parking supply and alter access or transit service. This would be expected at the NE 130th Street and NE 145th Street Stations in Segment A where smaller park-and-rides operate today. In Segment B, the Preferred Alternative and Alternatives B1 and B2A would temporarily reduce surface parking east of the existing garage at the Mountlake Terrace Transit Center, but the majority of the transit center's parking would remain available. The Preferred Alternative and Alternatives B1 and B2A would temporarily close the existing Mountlake Terrace freeway transit station during part of the construction period, while Alternative B4's median station construction would permanently close the existing freeway transit station. In Segment C, all the alternatives would temporarily reduce transit parking, but the Lynnwood Transit Center and most of the park-and-ride would still operate throughout project construction.

S.6 ENVIRONMENTAL EFFECTS

This Summary discusses the project's impacts at two levels: the full project from Northgate to Lynnwood, and then by segment, where there would be some localized differences in impacts. Table S-1 compares the overall environmental effects of the No Build Alternative against the light rail alternatives, while Tables S-2 to S-4 show, by segment, the primary differences in environmental impacts among the alternatives. The subsections below briefly summarize the primary types of impacts by environmental topic and note where some alternatives would have different impacts compared with others.

Acquisitions, Displacements, and Relocations. While the alternatives are designed to use I-5 and other public rights-of-way as much as possible, property acquisitions would be required along sections of the entire project corridor. Sound Transit will compensate owners for acquired properties and will offer relocation assistance consistent with the agency's acquisition and relocation policies and federal requirements. The Segment A Preferred Alternative would acquire 80 full properties and parts of 50 properties. The other light rail alternatives would acquire between 66 and 81 full properties, along with parts of 41 to 47 additional properties. Property impacts would be greatest in Segment A, where the I-5 right-of-way is the narrowest. In Segment A, most of the acquisitions would be residential properties.

In Segment B, considerably fewer parcels would be affected, with the Preferred Alternative acquiring four full properties and parts of 11 properties. The other Segment B alternatives would acquire two to seven full properties, and parts of three to 11 properties.

Segment C would require acquisitions of commercial and residential parcels. The Preferred Alternative in Segment C would acquire five full properties, displacing an estimated nine businesses, and acquire parts of 13 properties. The other light rail alternatives would acquire two to six full properties, and parts of 13 to 26 properties. Alternative C1 would have more displacements than the other alternatives, including 77 residences and 31 businesses.

Land Use. Land use would not be adversely affected as a result of any of the light rail alternatives. Acquisitions, both full and partial, in all segments would represent only a small portion of the land available. All alternatives would be generally consistent with regional and local plans and policies. Indirectly, the project could accelerate land use changes in station areas, such as at NE 145th Street or NE 185th Street, the Mountlake

Terrace Transit Center or its freeway station, at 220th Street SW, or at the Lynnwood Station, where local plans or policies allow redevelopment with mixed-use, higher-density, transit-oriented development.

Economics. Business impacts would be minimal in Segments A and B, but property acquisition would displace some businesses in Segment C for all alternatives, and employees could be affected by business disruptions or relocations. Local jurisdictions would have a slight initial reduction in property tax revenue as land is converted to a transportation use. However, the proposed project could provide economic benefits to local economies due to increased activity in station areas. Construction would also temporarily improve economic activity through construction employment as well as the purchase of materials. However, construction activities could also temporarily reduce the visibility and patronage of some businesses nearest to the light rail route, primarily in Segment C.

Neighborhoods. The proposed project would be on the borders of existing neighborhoods and would have minor effects on community facilities or services. The majority of the project's potential residential displacements are in Segment A, where all light rail alignments would affect residential properties bordering I-5 from about NE 117th Street through NE 195th Street; moreover, the stations would remove up to a block of homes. Alternative C1 would displace a condominium complex. There would be no long-term adverse impacts on neighborhood character and cohesion. Temporary construction impacts, including dust, noise, and traffic congestion, would affect the edges of neighborhoods adjacent to the alternative alignments in all segments.

Visual and Aesthetic Resources. Visual impacts would be caused by removing mature trees and dense vegetation that currently screen parts of I-5, by removing homes and other buildings, and by introducing prominent new structures. Some of the alternatives would have light rail guideways, noise walls, stations, and train operations that would be visually prominent for residents, park users, or travelers, particularly when the alternatives are elevated near neighborhoods or public areas with established views. Areas of high impacts are anticipated for portions of the Preferred Alternative and other alternatives in Segment A where vegetation would be removed and in areas where the alternatives would be developed near residential neighborhoods. For the Preferred Alternative and Alternative B2A in Segment B, areas of high impact would occur where trees and vegetation bordering I-5 would be removed for the guideway north of the Mountlake Terrace Transit Center. Alternatives C1 and C2 in Segment C would have areas of high impact where the guideway is elevated near residences and where trees and vegetation would be removed in or near a park. During construction, views would also be affected as Sound Transit clears the right-of-way and constructs the new facilities, and some work areas would be illuminated for nighttime construction.

Simulated View of Light Rail near NE 143rd Street

Air Quality and Greenhouse Gas Emissions. The light rail alternatives would decrease pollutants and greenhouse gases from vehicle emissions compared with the No Build Alternative. The project would be consistent with federal air quality standards at local and regional levels. During construction, there would be increased emissions from construction equipment and trucks, as well as more fugitive dust and particulates associated with grading and excavation.

Table S-1. Summary of Environmental Effects of No Build versus Light Rail Alternatives (All Segments)

Project Resource	Comparison Factor	No Build Alternative	Light Rail Alternatives
Transportation	Daily corridor ridership	32,000 to 34,000 riders on buses	63,000 to 74,000 riders on light rail
	Vehicle Miles of Travel (VMT)	100,600,000	100,310,000 to 100,330,000
	AM peak transit travel time – Lynnwood to Downtown Seattle	43 minutes	27–29 minutes
	Transit travel time savings at AM peak – Lynnwood to Downtown Seattle	0	14–16 minutes
Acquisitions, Displacements, and Relocations	Total property acquisitions (full and partial)	0	127–179
Land Use	Consistency with Regional and Local Growth Management Plans	Low	High
Water Resources	Increase in impervious surfaces	No direct change	40 to 53 acres, mostly non-pollutant generating surfaces
Ecosystem Resources	Total acres of ecosystem resources affected	0	9-24
Air Quality and Greenhouse Gases	Annual carbon dioxide equivalent reduction	No reduction	76,285 metric tons
Energy	Regional daily transportation energy consumption 2035 (per thousand British thermal units)	602,511	600,023
Electromagnetic Fields (EMF)	Potential for EMF exposure impacts	No new sources	No impacts
Geology and Soils	Risk of worsening geologic and soils conditions	None	None to low
Public Services and Utilities	Demand for services	Population growth and development could increase demand	Development could increase demand for services; all alternatives would be similar
	Potential for service disruption during light rail operation	Not applicable	Unlikely

a Only categories with noteworthy information impacts or differences among alternatives are shown; Chapters 3 and 4 include full results.
b Range reflects contingencies for a conceptual level design. Figures rounded to the nearest $10 million.
c Ridership range reflects total boardings at this station, but adjusted to reflect ridership changes caused by additional station(s) in Segment A or B and their effect on ridership in this segment.
d Preferred Alternative, with optional stations in Segments A and B.
e Includes park-and-ride noise impacts.
f Includes option for added parking.

Noise and Vibration. There are residences and other noise- and vibration-sensitive properties along the entire project corridor. Most, but not all, of the properties that would need mitigation from noise impacts are in Segment A. Mitigation for long-term vibration impacts would also be needed in Segments A, B, and C. Potential mitigation measures would include noise walls next to the light rail alignment, noise barriers along elevated guideways, residential sound insulation, and vibration-dampening design measures, and would eliminate long-term impacts. Construction-related noise and vibration would be produced by heavy equipment and construction tools, and most noise would be generated during the early phases of construction. The vibration generated during construction is not anticipated to cause damage to structures.

Ecosystem Resources. There would be no adverse impacts on threatened or endangered species. All light rail alternatives would cross several streams and tributaries in the project corridor, including Thornton Creek, McAleer Creek, and Scriber Creek, and would affect aquatic resources, vegetation, habitat, streams, wetlands, and buffers. The range of impacts from the Preferred Alternative and other light rail alternatives would be similar, and in most locations the impacts would be reduced through further detailed design efforts. In Segment B, the Preferred Alternative and Alternative B2A would relocate I-5 ramps, affecting wetland areas. The Preferred Alternative 220th Street Station option would shift the alignment west and avoid much of these impacts. In Segment C, the Preferred Alternative and Alternatives C2 and C3 would affect Scriber Creek and its wetlands, although impacts could be reduced through more detailed design to minimize fill as well as construction impacts. Stormwater runoff for the project would be managed to minimize effects on aquatic species.

Water Resources. There would be no water quality impacts resulting from stormwater because Sound Transit would comply with local government requirements for stormwater management. However, the project would increase the amount of existing impervious surface areas. In Segment C, the Preferred Alternative and other alternatives would place guideway columns in the Scriber Creek floodplain, but Sound Transit would provide compensatory floodplain storage. Construction impacts would be controlled by adhering to permit requirements and implementing best management practices, and by fulfilling stormwater management commitments described in the project's Biological Assessment (Appendix O).

Energy Impacts. There would be no long-term energy impacts compared with the No Build Alternative because the light rail alternatives would reduce energy consumption regionally. Construction would temporarily increase energy consumption but would not notably alter regional energy supply or demand.

Geology and Soils. The project is in a seismically active area; therefore, localized geologic hazards and risks are possible. However, the use of engineering measures would reduce the risk of harm from seismic events.

Hazardous Materials. Contaminated soil or groundwater is anticipated on four sites that could be acquired in Segment C for the Preferred Alternative. These sites would be remediated before or during light rail construction, which would be a beneficial effect. The other light rail alternatives would require the acquisition of three to six sites in this segment with known or likely contamination.

Wetland Near Scriber Creek in Lynnwood

Table S-5. Potential Section 4(f) Impacts

Section 4(f) Resource	Alternatives	Section 4(f) Use Determination
Ridgecrest Park, City of Shoreline	All Segment A Alternatives	*De minimis*. City of Shoreline has concurred with this determination. Light rail facility would be located on western edge of the park, removing trees that provide an existing visual buffer. Park would experience property and visual impacts but this would not impair park functions.
Shoreline Stadium, Shoreline Public Schools	Preferred Alternative and Alternative A1	*De minimis*. Shoreline School District has concurred with this determination. Minor right-of-way acquisition would affect a parcel and parking near the stadium.
Interurban Trail, Snohomish County Public Utility District, City of Lynnwood	All Segment C Alternatives	Temporary occupancy. Elevated guideway over trail, with temporary trail closures. Visual impacts, but the trail's primary functions, features, and attributes would be retained.
Scriber Creek Trail, City of Lynnwood	All Segment C Alternatives	Temporary occupancy. Elevated guideway over trail, with temporary trail closures. Visual impacts, but the trail's functions, features, or attributes would be retained.
Scriber Creek Park, City of Lynnwood	Alternative C1	Section 4(f) use. Guideway and structures would cross a corner of the park, removing trees and vegetation, and creating visual impacts.

Cultural, Archaeological, and Historic Resources. Four historic resources in the Area of Potential Effects are eligible for listing on the National Register of Historic Places, including Northgate Elementary, the Northgate Plaza Apartments, a former parsonage in Seattle, and a residence in Shoreline. None of the light rail alternatives would physically alter any of the historic structures, acquire historic property, or adversely impact their historic attributes or setting. There would be no adverse impacts on known archaeological sites, and no traditional cultural properties have been identified in the project corridor.

Parks and Recreational Resources. There are numerous parks and recreational resources near the light rail alternative routes. In Segment A, Jackson Park Golf Course would be affected by changed views for all alternatives, but there would be no direct physical impacts on the park. All Segment A alternatives would place light rail along the western edge of Ridgecrest Park, which would change views and remove mature trees. The Preferred Alternative and Alternative A1 would also require a corner of a parcel containing the Shoreline Stadium and its associated parking lot. The Preferred Alternative also has an option to build a parking garage on the current surface parking area south of the stadium. In Segment B, North City Park would have partially changed views but no direct physical impacts. In Segment C, all the light rail alternatives would cross the Interurban Trail and Scriber Creek Trail on elevated guideways. The Preferred Alternative and Alternative C3 would not affect Scriber Creek Park, while Alternative C1 would cross over a corner of Scriber Creek Park, and Alternative C2 would cross near the park. Alternative C1 would convert park land to a transportation use, which is restricted under a U.S. Department of Transportation (USDOT) regulation known as

Section 4(f). Therefore, as described in Section S.6.2, Alternative C1 would require modification before FTA could approve it.

Other Environmental Impacts. There would be no adverse impacts from electromagnetic fields or on public services, safety and security, and utilities.

Indirect and Cumulative Effects. Indirect environmental effects would be primarily related to the potential for increased development in station areas. Several of the jurisdictions either have plans in place encouraging mixed-use and higher-density development, or they may consider such policies depending on the final selection of stations to be built as part of the project. Cumulative effects, which are the effects of this project combined with the effects of other projects and actions, would be mostly focused at the start and end points of the project in the urban centers of Northgate and Lynnwood. At Northgate, the Northgate Link Extension is under construction, and other major development projects are also planned nearby. In a separate EIS process, Sound Transit is evaluating sites for a new OMSF, one of which is in Lynnwood near the project (the other 4 sites, including the Preferred Alternative, are in Bellevue). These other projects, if they are constructed at approximately the same time as the Lynnwood Link Extension, could increase overall construction period impacts. The other types of impacts would remain similar to those of the Lynnwood Link Extension alone.

S.6.1 Mitigation Measures

Sound Transit is committed to meeting the federal, state, and local environmental regulations and permit requirements that would apply to the project. The project would include reasonable mitigation measures to avoid significant adverse impacts. The Final EIS identifies mitigation measures that Sound Transit would apply to avoid or reduce the impacts identified for the project alternatives. The FTA Record of Decision will explicitly make mitigation measures a requirement of project implementation. A number of the mitigation measures would be further detailed through final design and permitting. Several environmental elements analyzed in the EIS would have no adverse impacts requiring mitigation after standard project measures are applied, including cultural, archaeological, and historic resources; electromagnetic fields; geology and soils; energy; and water resources. The following discussion summarizes key areas where mitigation measures are necessary.

Transportation. Sound Transit would mitigate intersections operating below local standards due to the project, or notably below No Build conditions that are already below local standards. Mitigation measures include added turn lanes, intersection/signalization improvements, traffic management, and other improvements as agreed to by the local jurisdiction. The mitigation would improve intersection delay to meet local standards, or to achieve the same level of service or better for intersections that would be below standards with the No Build Alternative.

Acquisitions, Displacements, and Relocations. Sound Transit would compensate and help relocate residents and businesses affected by property acquisitions, consistent with Sound Transit policy and applicable federal regulations.

Simulation of Jackson Park Golf Course with Elevated Alternatives

Noise and Vibration. Sound Transit would implement noise and vibration impact mitigation measures including noise walls (either at-grade

or as part of elevated guideways), insulation for buildings, and special track work.

Visual Quality. Sound Transit would provide mitigation in areas identified as having high visual impacts by using landscaping features or visual treatments to retaining walls and other structures, as practical, based on available land, safety, and maintenance and operational needs. Some changes in views would be unavoidable, and short- to medium-term adverse impacts may remain in locations where tree replacement and landscaping must mature to be effective mitigation.

Ecosystem Resources. During final design and permitting, Sound Transit will first try to avoid and minimize ecosystem impacts through design measures and best management practices. Where impacts are unavoidable, Sound Transit will mitigate them in accordance with applicable federal regulations, local critical area ordinances, and permit requirements. Sound Transit is committed to no net loss of wetland functions and wetland areas on a project-wide basis.

Parks and Recreational Facilities. Sound Transit would implement mitigation measures including compensation or replacement for directly affected properties, restoration or enhancement for any affected features or facilities, and landscaping. For Ridgecrest Park, Sound Transit has identified an area where it would develop replacement park property. For sections of parks or trails affected during construction, Sound Transit would work with local jurisdictions to develop detours, signage, and related measures to minimize the impacts of temporary closures. After construction, affected areas would be restored to existing conditions or better. Alternative C1 would require modifications to adequately mitigate its impacts to Scriber Creek Park.

Hazardous Materials. Sound Transit would investigate hazardous materials sites in the construction area and manage them to avoid the potential for exposure or spread of hazardous materials during construction.

Construction. Sound Transit would apply mitigation to help minimize or avoid construction impacts for each area of the environment. This includes transportation mitigation to reduce delays due to truck traffic, detours, and lane or street closures. To minimize impacts on communities, businesses, and public services, Sound Transit would have a 24-hour construction hotline for the project. Construction period outreach and communication would include notices of key construction activities, such as changes to transportation facilities or routes. Sound Transit would implement best management practices for construction to reduce impacts on air quality and water quality, reduce noise and vibration, and manage hazardous materials.

S.6.2 Section 4(f)

Section 4(f) refers to a USDOT statute that restricts FTA's ability to approve a project that adversely affects significant parks, recreation resources, fish and wildlife refuges, and historic properties. Table S-5 lists the Section 4(f) properties that the project may potentially impact or "use." If the impact would be minor and not alter the resource's functions and characteristics, Section 4(f) procedures allow *de minimis* impact findings, with concurrence from the official with jurisdiction over the Section 4(f) resource. Also, under certain conditions, the regulation exempts short-term construction impacts. Otherwise, the project must consider avoidance alternatives.

For the Preferred Alternative, there would be no Section 4(f) use; therefore, no avoidance alternatives are considered. The FTA made *de minimis* determinations for Ridgecrest Park and the Shoreline Stadium, and the affected jurisdictions have concurred. The impacts on the Interurban Trail and Scriber Creek Trail, where short sections would be closed during construction, meet the requirements for a construction-period exception for temporary occupancy. The FTA has determined that a Section 4(f) use would occur with Alternative C1. If it were to be advanced, Alternative C1 would first need to be modified to avoid Scriber Creek Park, or reduce the impact to the park to *de minimis*.

S.6.3 Environmental Justice

The Lynnwood Link Extension would be in or near some neighborhoods with minority and low-income populations. Presidential Executive Order 12898, Federal Actions to Address Environmental Justice to Minority Populations and Low-Income Populations, and USDOT Order 5610.2 direct Sound Transit and FTA to identify and meaningfully engage low-income and minority populations about the project, and to consider environmental effects that could fall predominantly on those populations.

The project would not result in disproportionately high and adverse effects on minority and low-income populations after all mitigation, enhancements, and offsetting benefits are considered. The project would cause residential and business displacements that could affect low-income or minority populations. Sound Transit's commitment to provide compensation and relocation assistance would mitigate these impacts. Noise impacts would be mitigated to meet FTA requirements. Some visual impacts would be unavoidable, and others could remain until replacement trees and landscaping mature. These impacts would be most apparent to people, including low-income and minority populations who live directly along the corridor. However, minority and low-income populations would also be near transit stations that provide benefits by improving mobility and the overall quality of transit service. Many locations along the corridor would experience reduced noise from I-5 as the project replaces traffic noise walls and updates them to meet current standards. Several locations in the corridor would have revised streets and intersections, improving multimodal access and addressing existing safety issues in several locations, which would be benefits.

Construction and operation impacts would affect areas with minority or low-income populations, but planning and outreach, proposed design measures, mitigation measures, and best management practices would reduce or minimize the effects, avoiding high and adverse environmental impacts.

Table S-6. Consistency with Project Purpose and Need

Purpose and Need	No Build Alternative	Preferred Alternative	Other Light Rail Alternatives
Provide reliable, rapid, and efficient transit service with sufficient capacity to meet current and projected demand	No	Yes	Yes
Forecast year 2035 transit travel times from Lynnwood to Northgate (AM peak period)	26 minutes	14 minutes	14 to 16 minutes
Forecast year 2035 transit travel times from Northgate to Lynnwood (PM peak period)	24 minutes	14 minutes	14 to 16 minutes
Provide a mobility alternative to travel on congested roadways	No	Yes	Yes
Support the region's adopted land use, transportation, and economic development plans	No	Yes	Yes
Extend the regional light rail system in support of the Sound Transit Long-Range Plan	No	Yes	Yes
Implement a financially feasible system that seeks to preserve and promote a healthy environment	No	Yes	Yes

S.6.4 Ability of Alternatives to Meet the Purpose and Need

The project's Purpose and Need, detailed in Chapter 1 of the Final EIS, is summarized in Table S-6, to show how effective the Preferred Alternative and the other light rail alternatives would be in meeting the purpose and need of the project.

S.6.5 Estimated Project Costs

With seven alternatives in Segment A, four in Segment B, and four in Segment C, there are many possible segment combinations that could be linked to create the full 8.5-mile light rail extension from Northgate to Lynnwood. The Preferred Alternative would have total capital costs of $1.5 to $1.7 billion, while other alternative combinations would range from $1.4 to $2.0 billion. The estimated capital cost of each light rail alternative is presented in Tables S-2, S-3, and S-4. All of the light rail alternatives would cost about $16 million per year to operate and maintain, but their costs would vary by several hundred thousand dollars annually, depending on how many stations are included. Chapter 5, Evaluation of Alternatives, provides additional details.

S.7 COMPARISON OF ALTERNATIVES

This section summarizes the primary differences in ridership, environmental impacts, and benefits among the light rail alternatives.

S.7.1 Segment A: Seattle to Shoreline

All Segment A alternatives would displace a similar number of residences through acquisitions, although the elevated alternatives would be better able to avoid impacts in some areas. The primary differences in property impacts are at the stations. Sound Transit modified the Preferred Alternative and other at-grade Segment A alternatives by realigning 3rd Avenue NE, which maintains access for the Seattle Latvian Evangelical Lutheran Church and church hall (also called the cultural center), avoiding their displacement.

All Segment A alternatives would replace some existing noise walls and install new noise walls, barriers, and other mitigation for noise impacts. The mostly elevated alternatives (A3, A7, and A11) would have the most noise impacts. Mitigation for all alternatives would reduce transit noise to levels below FTA thresholds and avoid increases in traffic noise. The project would also meet local regulatory requirements for construction-related noise control.

While all Segment A alternatives would be visible from the Jackson Park Golf Course, the mostly elevated alternatives (A3, A7, and A11) would have more impacts on views. All alternatives would acquire an edge of Ridgecrest Park in Shoreline. The design for the Preferred Alternative includes replacement property as well as other mitigation details to offset the impacts, but other alternatives would develop similar mitigation. The Preferred Alternative and Alternative A1 include a roadway realignment that would affect part of the Shoreline Stadium parking lot.

The NE 130th Street Station (an option for the Preferred Alternative, and part of A5, A7, A10, and A11) would increase costs, but it would have few other environmental effects than an alignment with no station there. It would slightly increase boardings in Segment A, but overall Link system ridership would be about the same because most of the added station riders would be shifting from either the Northgate Station or the NE 145th Street Station.

The NE 145th Street Station alternatives (Preferred Alternative, A1, A3, A10, and A11) would displace residential properties, require street or interchange modifications, and place a multistory parking garage near residences. However, these alternatives would serve several populous neighborhoods in Seattle and north King County and would have direct I-5 access. The NE 155th Street Station (A5 and A7) would also displace residences and add a multistory garage in a mostly residential area, but it would not have direct I-5 access.

All configurations of the NE 185th Street Station would have similar ridership. At-grade alternatives (Preferred Alternative, A1, A5, and A10) would have more street realignments, while the elevated alternatives would have more visually prominent guideways and an elevated station. All of the alternatives would displace about a block of homes. The Preferred Alternative and Alternative A1 would have a parking garage on the west side of I-5 in an area that would otherwise have few changes with the other alternatives.

Alternatives requiring bridge reconstruction or other bridge overpass improvements would require short-term lane closures on I-5. This would occur at NE 117th Street (A1), NE 130th Street (Preferred Alternative and A1), and NE 185th Street (Preferred Alternative and A1).

Alternatives featuring three stations (A5, A7, A10, and A11) rather than two (Preferred Alternative, A1, and A3) would have higher costs. While three stations would slightly increase ridership in Segment A, they would lengthen travel times. If the Preferred Alternative with the option for the NE 130th Street is selected to be built, it would also have longer travel times and a slight increase in ridership.

S.7.2 Segment B: Shoreline to Mountlake Terrace

The Preferred Alternative and B2A would have high visual impacts as a result of crossing over I-5 and removing dense vegetation on the west side of I-5; however, these impacts described in the Draft EIS have been reduced by modifying the alternatives to avoid WSDOT property established for interstate highway beautification. Alternatives B1 and B4 would have lower visual impacts because more of their alignments would be in the I-5 median.

The Preferred Alternative and B2A alignments along the hillside west of I-5 would remove up to 11 acres of forest cover compared with 5 acres with Alternative B1 and 3 acres with Alternative B4. The Preferred Alternative and B2A would affect the most wetlands and wetland buffer because the guideway and modified I-5 ramps would cross a pair of wetlands. The Preferred Alternative's option for a 220th Street SW Station would not need to move the ramps, lowering the impacts on adjacent wetlands.

Alternative B2A, which has a station at 220th Street SW, and the Preferred Alternative with an option for an additional station, would have more impervious surfaces requiring stormwater management measures to protect water resources.

During construction, Alternative B4 would need to permanently close the bus ramps at the current freeway transit stop for the Mountlake Terrace Transit Center. This would affect express transit service to the transit center. There would be short-term closures (3 to 6 months plus nighttime closures) of the direct access ramps to the freeway transit stop with the Preferred Alternative and Alternatives B1 and B2A. Sound Transit would alter its own routes and work with other transit agencies to revise transit services, including temporary services between Mountlake Terrace and destinations in King County, to reduce impacts of a temporary closure of the transit center.

The Segment B alternatives would have different ridership, depending on whether a station is sited at the Mountlake Terrace Transit Center (Preferred Alternative, B1, and B2A) or its nearby freeway transit stop (Alternative B4); a freeway station would take longer for riders to access, which would comparatively reduce ridership. The Preferred Alternative with the 220th Street Station option and Alternative B2A would provide an additional station at 220th Street SW, but the project's overall ridership would not notably increase. The added station would attract riders, but there would then be fewer riders boarding at the Mountlake Terrace Transit Center and Lynnwood. Alternatives with two stations would also have higher costs and longer transit travel times.

The Preferred Alternative and Alternatives B1 and B2A would best support potential transit-oriented developments in Mountlake Terrace's planned town center because their station would be east of

I-5, at the existing park-and-ride, with an entrance south of 236th Street SW. This would be closer to the planned town center than the Alternative B4 freeway station.

All of the Segment B alternatives would likely require temporary nighttime construction-period lane closures and other restrictions on I-5 to install girders and construct guideway bridges to cross to the median or the west side of I-5.

S.7.3 Segment C: Mountlake Terrace to Lynnwood

Although the Preferred Alternative would not displace any residences, it would displace nine businesses, and several other commercial parcels would have partial acquisitions that would affect existing parking spaces. Alternative C1 would acquire a condominium complex and two business parks, displacing up to 77 residences and 31 businesses. In contrast, Alternative C3 would displace one business, and Alternative C2 would displace three businesses and one residence.

Alternatives C1 and C2 would have higher visual impacts than the Preferred Alternative or Alternative C3 because the elevated guideways would be nearer to residential properties and Scriber Creek Park.

Alternative C2 would cross the Scriber Creek wetland complex and affect the largest amount of stream and wetland buffer area. Alternative C1 would cross north of the wetlands with the least amount of impact. The Preferred Alternative and Alternative C3 would cross near the southern end of the Scriber Creek wetland complex, and would have fewer wetland (including wetland buffer) and stream impacts than Alternative C2 but more impacts than Alternative C1.

As for Scriber Creek Park, Alternative C1 would have columns and a section of the elevated guideway within the park along Cedar Valley Road, which would alter this corner of the park and would constitute a Section 4(f) use. Therefore, Alternative C1 could not be built unless it were redesigned to avoid the use of the park or reduce impacts to a de minimis level. Alternative C2 would not be in the park but would have visual impacts, primarily along the Scriber Creek Trail. The Preferred Alternative and Alternative C3 would not affect the park.

All of the Segment C alternatives would serve the same area and have similar opportunities to support transit-oriented developments, but the station site choices would offer different opportunities for developing the area over time. The Preferred Alternative would reconfigure parts of the existing park-and-ride in order to construct the station and a parking garage. It would allow direct access to the transit center and closer access to the Lynnwood city center. It would avoid dividing part of a block (east of 44th Avenue West) that is targeted for higher-density development, which Alternative C3 would affect. The Alternative C1 station at 200th Street SW would be closest to the designated city center for Lynnwood and would avoid impacts to the existing transit center and park-and-ride during construction; however, this station would displace the most businesses and residences, and it would affect Scriber Creek Park. Alternatives C2 and C3 would be farther from the city center, but Alternative C2 would affect the Scriber Creek wetlands the most, as well as having visual effects on Scriber Creek Park. Alternative C3 would have the fewest displacement impacts, but would be farthest from the transit center and from the city center, and its tail track would bisect a large parcel where the City anticipates higher-density development.

S.8 PUBLIC AND AGENCY INVOLVEMENT

Sound Transit and FTA have been engaging the public and agencies since the start of early scoping for the project's Alternatives Analysis in 2010. They initiated the Draft EIS with formal public environmental scoping in September and October of 2011, which included meetings with the public and agencies, as well as a comment period and public notices and advertisements. Sound Transit continued to host public events and meet with

agencies and interested groups as the Draft EIS was being prepared in 2012 and early 2013. The release of the Draft EIS came with a formal public review and comment period, including meetings and hearings, as described in Section S.11, Draft EIS and Public Comments. Chapter 6, Public Involvement and Agency Coordination, of the Final EIS has additional details about the project's public involvement and agency coordination plan, including how Sound Transit and FTA have engaged low-income and minority populations in the project. Chapter 7, Draft EIS Comments and Responses of the Final EIS, summarizes the public comments Sound Transit and FTA received on the Draft EIS, and Appendix P, Draft EIS Public Comments and Responses, provides Sound Transit's and FTA's responses to each substantive comment received during the public comment period.

S.9 AREAS OF CONTROVERSY AND ISSUES TO BE RESOLVED

Public and agency comments suggest limited project-related controversy in most areas. However, during the Draft EIS public review and comment period, Sound Transit and FTA received several hundred comments about potential impacts to the Seattle Latvian Evangelical Lutheran Church, which would have been relocated by some of the Segment A alternatives. The church, individuals, community organizations, and representatives of Latvia asked Sound Transit to avoid displacing the church. In response, Sound Transit developed designs to realign a section of 3rd Avenue NE, maintaining access to the church and avoiding the need to relocate it or its community hall. Also in Segment A, two of the alternatives (A5 and A7) feature a station at NE 155th Street, which the City of Shoreline opposed in a comment letter during environmental scoping and in Draft EIS comments. The 155th Street Station is not an element of the Preferred Alternative.

In Segment C, all alternatives cross an Edmonds School District property that is to be developed as a bus base and district operations center. The District's comment letter on the Draft EIS opposed alternatives that would affect their development plans, but supported a City of Lynnwood proposal to modify Alternative C3. The Preferred Alternative features several elements of that proposal, as refined by Sound Transit in coordination with the City and the District.

Public comments on the Draft EIS also highlighted impacts to Scriber Creek Park in Segment C. Alternative C1 was considered by commenters to have the greatest impacts to the park and nearby wetlands, followed by Alternative C2. Alternatives C1 and C2, which have elevated sections near Lynnwood neighborhoods and involve acquisition and relocation of businesses and/or residents, were also frequent comment topics. Alternative C3 primarily had comments of support, although comments noted property impacts, wetland impacts, and station location as concerns.

The City of Lynnwood and the Edmonds School District opposed the Lynnwood site alternative for Sound Transit's Link OMSF, which is a separate project that would support light rail operations and maintenance needs for the ST2 program of projects, including the Lynnwood Link Extension. In July 2014, Sound Transit identified a site in Bellevue as the Preferred Alternative for evaluation in the Final EIS along with the other OMSF alternatives. A final decision on the siting will be made after the Final EIS is issued for that project.

Issues yet to be resolved relate to agreements that Sound Transit must secure from WSDOT and FHWA to use parts of the I-5 right-of-way permanently as well as during construction. In addition to needing approvals for the use of the right-of-way, Sound Transit would need approvals for modifying any I-5 interchange or other parts of the freeway, such as shoulders or existing noise walls; for constructing staging and access; for implementing any lane closures affecting the interstate highway; and for conducting any modifications that could affect highway operations or safety. Most of these approvals would occur during final design. Sound Transit has coordinated with FHWA and WSDOT to develop conceptual

engineering definitions for the alternatives, but as final design progresses, FHWA or WSDOT could request modifications or place other restrictions on the project. Sound Transit has worked successfully with WSDOT and FHWA to obtain approvals for right-of-way use for other Sound Transit projects, but it would affect the project costs, construction impacts, and work schedule if Sound Transit is not able to use the right-of-way as anticipated in the current design of the alternatives.

Project funding also remains an issue to be resolved. Sound Transit is proposing the project as a candidate for FTA's Capital Investment Grant (New Starts) grants program. Recent legislation has changed some of the requirements for the program, and its longer-term funding levels are subject to congressional appropriation.

Potential stations at NE 130th Street, NE 155th Street, and 220th Street SW were not evaluated in the ST2 planning process, which analyzed ridership and cost for each station, and are not currently included in the ST2 Plan. Consistency with the ST2 Plan would need to be further evaluated before any of these stations could be added to the Lynnwood Link Extension.

S.10 SIGNIFICANT UNAVOIDABLE ADVERSE IMPACTS

With the avoidance, mitigation, and minimization measures detailed in Chapter 3, Transportation Impacts and Mitigation, and Chapter 4, Environmental Impacts and Mitigation, of the Final EIS, significant adverse impacts would be avoided for most alternatives. However, some impacts might not be fully mitigated. All alternatives would replace mature vegetation with light rail facilities, and there would be related loss of habitat. This would also result in longer-term visual impacts that would not be immediately mitigated by replacement vegetation or landscaping. Temporary construction impacts, such as freeway lane closures, street closures, or truck traffic, would cause congestion and inconveniences in some locations, and these impacts could be significant.

S.11 DRAFT EIS AND PUBLIC COMMENTS

The Draft EIS was available for an extended comment period of 60 days (July 26 to September 23, 2013) that included four public hearings and other opportunities for the public and agencies to comment in person or in writing. Chapter 7, Draft EIS Comments and Responses, details how the public was able to comment.

The Sound Transit Board of Directors considered the public and agency comments received as well as the information in the Draft EIS. The Board then identified a Preferred Alternative for evaluation in the Final EIS along with the other light rail alternatives.

S.12 NEXT STEPS

The Sound Transit Board will consider the analysis in the Final EIS and will then select the project alternative to be built. After the Board's decision, FTA also is expected to publish its Record of Decision (ROD) for the project, which will document findings by FTA that the project has met the requirements of NEPA and related environmental regulations. It will describe FTA's decision on the project, alternatives considered, the basis for the decision to approve the project, and mitigation measures required.

FTA is directed to issue a combined Final EIS and ROD document pursuant to Public Law 112-141, 126 Stat. 405, Section 1319(b) unless it determines, for statutory criteria or practicability reasons, that separate EIS and ROD documents are appropriate. A joint Final EIS/ROD is not required when a Draft EIS does not identify a Preferred Alternative, which was the case with the Lynnwood Link Extension Draft EIS. The Lynnwood Link Extension EIS is a joint NEPA and SEPA document consistent with 40 Code of Federal Regulations (CFR) 1506.2(c) and it supports decision-making by Sound Transit, FTA, and other agencies, but the timing of their decisions varies. For example, SEPA requires that the Sound Transit

Board's final decision on the project to be built be informed by the Final EIS, and a final decision cannot be made until the Final EIS has been issued. The FTA ROD is required to describe the final project decisions and therefore must be issued after the Sound Transit Board's final decisions on the project. FTA has thus determined it is not practical to issue a combined Final EIS and ROD; these documents are being published separately.

After the Sound Transit Board selects the project to be built and FTA issues a ROD, Sound Transit will initiate final design, begin property acquisition, conduct construction planning, and apply for the other permits and approvals needed to construct and operate the project. This includes the FHWA approvals needed to construct and operate the light rail project within the interstate right-of-way. FHWA is expected to issue its own ROD for the project, and may rely on this Final EIS to help meet other applicable decision requirements. Similarly, the local jurisdictions issuing permits for the project may rely on the Final EIS to help satisfy their SEPA requirements. Final design and permitting is scheduled for 2015 to 2018. Construction of the project is expected to start in 2018 and end in 2023, with service starting in late 2023.

1 PURPOSE AND NEED

1.1 Lynnwood Link Extension

The Central Puget Sound Regional Transit Authority (Sound Transit) is proposing the Lynnwood Link Extension to expand the regional light rail system north from Northgate in Seattle to Shoreline, Mountlake Terrace, and Lynnwood in Washington State. This project was previously known as the North Corridor Transit Project, and is part of the Sound Transit 2 (ST2) program of projects.

The Lynnwood Link Extension would help implement the strategic vision for regional growth management and transportation established by the Puget Sound Regional Council's (PSRC) *VISION 2040* (PSRC 2009), *Transportation 2040* (PSRC 2010), and the *Regional Transit Long-Range Plan* (Sound Transit 2005a, 2014), all of which anticipate the eventual extension of light rail north of the city of Lynnwood to the city of Everett in Snohomish County.

Sound Transit and the Federal Transit Administration (FTA) are preparing this environmental impact statement (EIS) for the project in compliance with the National Environmental Policy Act (NEPA) and the Washington State Environmental Policy Act (SEPA). FTA is the federal lead agency for the NEPA EIS process, and Sound Transit is the state lead agency for SEPA. This chapter describes the proposed project's setting and why the project is being proposed.

1.1.1 Project Area

The proposed Lynnwood Link Extension would begin at Northgate in north Seattle and end at the Lynnwood Transit Center (Figure 1-1). The 8.5-mile project corridor generally follows Interstate 5 (I-5), the major north-south freeway through the state, and the primary route serving a large commuter market traveling between Snohomish and King counties. The project corridor travels through the cities of Seattle and Shoreline in King County, and Mountlake Terrace and Lynnwood in Snohomish County. This is one of the most densely developed urbanized areas in the Pacific Northwest and is part of a longer north-south corridor connecting Olympia, Tacoma, Seattle, and Everett. Each year population and employment grow in these corridor communities. Roadways in this corridor experience high levels of congestion throughout large portions of the day, which degrades mobility and reliability. The corridor is one of the region's most productive markets for transit, and there have been major investments in public transit infrastructure and service over the past 40 years.

Legend

- Lynnwood Link Extension
- Link in service
- Under construction
- In planning
- In design

Figure 1-1
Regional Setting for
the Lynnwood Link Extension

With *Sound Move*, the first set of required mass transit investments, Sound Transit began light rail service in 2009 with Central Link, which launched a system that now runs 13.9 miles between downtown Seattle and Seattle-Tacoma International Airport (Sea-Tac Airport). Construction currently underway will extend light rail by 3 miles from downtown Seattle to the University of Washington by 2016, and another 4.3 miles from the University of Washington to Northgate by 2021 (Figure 1-1). With the Lynnwood Link Extension and the other projects in the ST2 program, Sound Transit is developing nearly 36 miles of new service to the north, south, and east. The combined *Sound Move* and ST2 programs will complete nearly 55 miles of light rail to serve the Puget Sound region. The ST2 program defined the Lynnwood Link Extension as light rail extending from the Northgate Transit Center to the Lynnwood Transit Center, with intermediate stations serving north Seattle, Shoreline, and Mountlake Terrace.

1.1.2 Corridor Communities

The project corridor is home to established communities that are redeveloping and increasing in density. The compact nature of these communities is reinforced by the geographic constraints of Puget Sound and Lake Washington on either side of the corridor. Everett is to the north, and Seattle, the state's largest population and employment center, is to the south. Land use in the project corridor is largely residential but is anchored by major regional commercial centers at Northgate and Lynnwood, with town centers and other activity centers located in between. As of the 2010 United States Census, nearly 126,000 people lived within 0.5 mile of the project corridor in Seattle, Shoreline, Mountlake Terrace, and Lynnwood; for the same period, PSRC estimated nearly 60,000 jobs were within the corridor. The total population and employment in each of these cities is even higher: 720,000 people and 565,000 jobs as of 2010.

Regional and local plans anticipate high levels of growth in the corridor communities through 2040. Population during this period is predicted to grow 20 percent and employment 40 percent by 2040. While the number of jobs will grow in the corridor, mostly at the Northgate and Lynnwood urban centers, many residents in the corridor will also commute to jobs in other rapidly growing urban centers to the south in Seattle and in east King County cities such as Bellevue and Redmond.

1.2 Purpose and Need for the Lynnwood Link Extension

In 2010, Sound Transit developed a preliminary Purpose and Need Statement as part of an Alternatives Analysis and early scoping process for the proposed project. Following public and agency review, the preliminary statement was revised based on comments received. When this EIS was initiated with environmental scoping and another public comment period in September and October 2011, Sound Transit again invited public comment on the Purpose and Need Statement. Finally, the

Draft EIS issued on July 26, 2013, gave another opportunity for review and comment on the Purpose and Need. The resulting Purpose and Need Statement reflects public and agency comments and is consistent with the direction of the Sound Transit Board of Directors in late 2011 and early 2012. This included the Board's adoption of Motion M2011-87, which incorporated the results of the Alternatives Analysis, and confirmed light rail as the high-capacity transit mode for the Lynnwood Link Extension. As Chapter 2, Alternatives Considered, further describes, the Alternatives Analysis concluded that light rail in an exclusive right-of-way is the only mode that can address the corridor's growing mobility, access, and capacity needs.

1.2.1 Purpose of the Project

The purpose of the Lynnwood Link Extension is to expand the Sound Transit Link light rail system from Northgate in Seattle north into Shoreline, Mountlake Terrace, and Lynnwood in Snohomish County in order to:

- Provide reliable, rapid, and efficient peak and off-peak two-way transit service of sufficient capacity to meet the existing and projected demand for travel to and from the corridor communities and other urban centers in the Central Puget Sound area.
- Create an alternative to travel on congested roadways, and improve connections to the regional multimodal transportation system.
- Support the adopted land use, transportation, and economic development plans of the region and the corridor communities.
- Advance the long-range vision, goals, and objectives for transit service established by the Sound Transit Long-Range Plan for high-quality regional transit service connecting major activity centers in King, Pierce, and Snohomish counties.
- Implement a financially feasible system that seeks to preserve and promote a healthy environment.

1.2.2 Need for the Project

The project is needed to:

- Address increasingly unreliable travel times for transit trips that now rely on the corridor's highly congested roadways and high-occupancy vehicle (HOV) lanes.
- Address overcrowding caused by insufficient transit capacity.

- Create a reliable alternative to automobile trips on I-5 and State Route (SR) 99, the two primary highways serving the project corridor, which are unreliable and over capacity throughout large portions of the day.
- Increase mobility, access, and transportation capacity for the 20 percent growth in population and 40 percent growth in employment projected in the regional growth and activity centers in the corridor and the region, consistent with PSRC's *VISION 2040* and *Transportation 2040*, as well as related county and city comprehensive plans.
- Create the transit infrastructure needed to support the development of Northgate and Lynnwood—the corridor's two designated regional growth centers.
- Advance the Sound Transit Long-Range Plan for a future extension of mass transit north to Everett.
- Ensure long-term regional mobility, multimodal connectivity, and convenience for the corridor's citizens and communities, which include travel-disadvantaged residents and low-income and minority populations.
- Help the state and region reduce transportation-related energy consumption and reduce harmful greenhouse gas emissions in the atmosphere, in accordance with state laws.

1.3 Planning History for Lynnwood Link Extension

Many years of planning and past investments have focused on the need for effective regional transit serving this corridor's communities. Transit shaped the original development of the communities beginning in 1910, when the Interurban railway began operating between Seattle and Everett. However, transit service faltered in the 1950s when the Interurban stopped running. The "Forward Thrust" regional transit system proposals of the late 1960s and early 1970s included fixed guideway transit along the I-5 corridor in King County, but funding was defeated at the polls. Since then, a largely commuter-oriented transit system comprising express bus infrastructure and services has developed to serve rapid population and employment growth along the I-5 corridor, helping to connect Snohomish County suburban residents to jobs in Seattle. Express bus investments have included HOV lanes, park-and-ride facilities, transit centers, direct access ramps, and freeway transit stations.

The region renewed its efforts to develop mass transit service connecting Seattle and Snohomish County in the 1990s. In 1993, the Central Puget Sound Regional Transit Authority (Sound Transit) was created, and in 1995 the Lynnwood Link Extension project corridor was part of a large proposal for developing regional light rail connecting King, Pierce, and Snohomish counties; however, the voters did not

approve that program. The following year, voters approved financing for a scaled-back program known as *Sound Move* that included light rail in King County, improved regional express bus services, commuter rail, and related facilities. Sound Transit defined a second phase of investments after completing a Long-Range Plan Update in 2005, and the resulting ST2 program was approved by voters in 2008.

Chapter 2, Alternatives Considered, describes the more recent steps in this project's planning, including an Alternatives Analysis Sound Transit conducted starting in 2010, and the agency's continued planning and design efforts for this EIS.

1.3.1 Regional Plans for Managing Growth and Transportation

The Puget Sound region, which encompasses urbanized King, Pierce, Snohomish, and Kitsap counties, has a coordinated series of regional, county, and local plans and policies that guide how the region is managing its growth. Many of these plans have directly shaped the development of the Lynnwood Link Extension.

Federal legislation for federal transportation programs strongly emphasizes the importance of linking regional and related transportation planning decisions with individual project decisions. The Moving Ahead for Progress in the 21st Century Act (MAP-21) re-emphasized the need for local agencies to integrate their local plans into the NEPA process.

The primary regional land use and transportation plans relevant to the Lynnwood Link Extension are PSRC's *VISION 2040* (PSRC 2008) and *Transportation 2040* (PSRC 2010a). The Sound Transit Long-Range Plan serves as the regional transit element of *Transportation 2040*. These plans share land use, growth management, and transportation policies that call for an effective regional transit system to link the urban centers where the region's growth will be focused. County and local city comprehensive plan policies in the project corridor and throughout the region reinforce the need for high-capacity transit investments to support new population and employment developments, as well as to provide for vibrant urban communities that offer alternatives to automobiles.

VISION 2040

VISION 2040, which PSRC amended in 2009, is the region's integrated, long-range vision for accommodating the approximately 5 million people expected to live in the Puget Sound region by 2040. Its goals are to maintain a healthy region, promote the well-being of people and communities, ensure economic vitality, and preserve a healthy environment. Northgate and Lynnwood are both designated as regional growth centers in *VISION 2040*, and the Lynnwood Link Extension would connect these growth centers.

Transportation 2040

Transportation 2040, which was adopted by PSRC in May 2010 and amended in 2012 and 2014 with new forecasts and projects, is the region's metropolitan transportation plan and one of the key action plans to implement the *VISION 2040* strategy over the next 30 years. The region's growth in jobs and population is expected to boost demand for travel within and through the region by about 40 percent. *Transportation 2040* outlines a long-term program for regional transportation investments, including the Lynnwood Link Extension, to address rising travel demand.

Regional Transit Long-Range Plan and ST2

The Regional Transit Long-Range Plan outlines Sound Transit's vision for a high-capacity transit system serving the urban areas of Snohomish, King, and Pierce counties. The plan identifies corridors for light rail, commuter rail, regional express bus, and bus rapid transit services. The Lynnwood Link Extension is part of the Seattle-to-Everett corridor for high-capacity transit. The 2005 plan update led to the ST2 program of projects, which included a light rail extension from Northgate to Lynnwood. The Lynnwood Link Extension is also included in the 2014 update to the Regional Transit Long-Range Plan.

1.3.2 Regional and Local Transportation Systems

Regional Highways

The project corridor encompasses I-5—one of the two primary north-south highways between Lake Washington and Puget Sound. I-5 is the most heavily traveled highway in the state, serving regional and interstate movements of both people and goods, carrying from 159,000 to 196,000 vehicles in the project corridor on an average day (WSDOT 2011). In addition to I-5, SR 99 provides a north-south connection; several other state highways, including SR 104 and SR 523, provide important east-west connections.

The Washington State Department of Transportation (WSDOT) time-reliability calculator[1] indicates that a trip from Lynnwood to Seattle at free-flow speeds should take about 15 minutes on I-5. Because of the high levels of congestion and unpredictable delays, a commuter must allow up to 55 minutes for the trip during the AM peak period to ensure arriving on time 95 percent of the time. Physical and environmental constraints limit the addition of more highway capacity in the project corridor. Regional transportation planners expect the current high levels of travel demand to continue growing, and congestion and unreliability for travelers on I-5 to increase through 2040 (PSRC 2014).

[1] WSDOT 95% Reliable Travel Times calculator: http://www.wsdot.com/traffic/Seattle/TravelTimes/reliability/default.aspx

Transit

The project corridor has an extensive network of bus routes, most of which run generally north and south. Much of the project corridor's transit demand is fueled by commuters from north King County and south Snohomish County heading for downtown Seattle and the University District—two major employment centers in the region. Thirty-six weekday bus routes provided by three transit agencies operate through the project corridor along I-5. Most are peak-period, peak-direction, point-to-point routes linking south Snohomish County, north King County neighborhoods, and park-and-ride lots to major employment centers in King County. The project corridor carries the second highest bus ridership volumes in the region, with over 19,000 daily riders in 2011.

Delays on I-5 affect travel times and reliability because HOV lanes are not continuous south of Northgate. Slow traffic in the general purpose lanes slows travel in the HOV lanes as well. This makes transit travel particularly unreliable and lengthy during the morning and evening peak periods when most transit use occurs. The I-5 HOV lanes in the project corridor do not meet the WSDOT policy standard for average HOV lane speeds of 45 miles per hour (mph) or greater at least 90 percent of the time during the morning and afternoon rush hours (WSDOT 2014).

1.4 Applying the Purpose and Need to the Project

The Purpose and Need Statement helped Sound Transit identify the EIS alternatives described in Chapter 2, Alternatives Considered. Chapter 5, Evaluation of Alternatives, describes how Sound Transit and FTA have measured the alternatives' ability to serve the purpose and need, along with comparisons of other factors such as environmental impacts, costs, and constructability.

2 ALTERNATIVES CONSIDERED

This Final EIS evaluates a Preferred Alternative for the Lynnwood Link Extension, other light rail alternatives, and a No Build Alternative. The light rail project would be 8.5 miles long, starting at the Northgate neighborhood of Seattle and continuing north to the cities of Shoreline, Mountlake Terrace, and Lynnwood.

The Lynnwood Link Extension would directly connect to the northern terminus of the Link light rail system at Northgate. From there, riders could continue south on the Link system to the University of Washington, Capitol Hill, downtown Seattle, Rainier Valley, Tukwila, SeaTac, and Sea-Tac Airport. Separate projects to extend light rail to the south and east will allow direct connections to Bellevue, Redmond, and Federal Way.

In 2010, Sound Transit started detailed project-level planning to produce the alternatives considered in this EIS. Section 2.6, Alternatives Development, describes the steps Sound Transit and FTA took to work with the public, tribes, and agencies to consider the range of alternatives during the Alternatives Analysis process. A comparative evaluation of the alternatives is in Chapter 5, Evaluation of Alternatives.

Sound Transit and FTA published a Draft EIS for the project, followed by a 60-day comment period. The Sound Transit Board then reviewed the alternatives, the Draft EIS, and the public comments before approving Motion M2013-96, identifying a Preferred Alternative, and directing staff to further evaluate potential modifications and options for the Preferred Alternative and other alternatives in the Final EIS.

2.1 Light Rail Alternatives

This Final EIS evaluates a range of light rail alignments and stations generally following I-5 from the Northgate Transit Center in Seattle to the Lynnwood Transit Center. The Preferred Alternative and the other alternatives are analyzed in three geographic segments, as shown in Figure 2-1.

Segment A: Northgate to Shoreline. There are seven Segment A alternatives between Northgate in Seattle and NE 185th Street in Shoreline, all on the east side of I-5. They include at-grade and elevated alignments, each with two or three stations, some of which would include park-and-ride facilities. The potential station sites are at NE 130th Street, NE 145th Street, NE 155th Street, and NE 185th Street.

- Waterbody

Note:
Each segment alternative can be matched to any adjacent segment alternative.

Figure 2-1
Alternatives by Segment

Lynnwood Link Extension

Segment B: Shoreline to Mountlake Terrace. There are four Segment B alternatives between NE 185th Street in Shoreline and 212th Street SW in Mountlake Terrace. Each alternative begins on the east side of I-5 and ends either in the I-5 median or on the west side of I-5. These alternatives feature one or two stations with park-and-ride facilities, including a station serving the existing Mountlake Terrace Transit Center (236th Street SW) and potentially an additional station at 220th Street SW.

Segment C: Mountlake Terrace to Lynnwood. Segment C has four alternative routes for departing from the I-5 median or west side of I-5 to end at a northern terminus station, with park-and-ride facilities at or near the existing Lynnwood Transit Center at 200th Street SW.

2.2 The Preferred Alternative

With Motion M2013-96, the Sound Transit Board identified the Preferred Alternative for evaluation in the Final EIS, based on the analysis in the Draft EIS and public and agency comments.

2.2.1 Segment A

The Preferred Alternative identified for Segment A is similar to Alternative A1, which is an at-grade/elevated alignment with NE 145th and NE 185th Street Stations, but modified by shifting the guideway east of 1st Avenue NE and the NE 117th Street bridge (as in Alternative A5); maintaining access to the Seattle Latvian Evangelical Lutheran Church; including the NE 145th Street Station based on Alternative A3, Station Option 2; and moving the guideway east of the NE 185th Street bridge (as in Alternative A5).

The project team also evaluated two potential modifications to the Preferred Alternative, including a retained cut station at NE 130th Street or a design that would allow its future addition, as well as pedestrian improvements on the NE 185th Street bridge over I-5.

2.2.2 Segment B

The Preferred Alternative is Alternative B2, East Side to Mountlake Terrace Transit Center to West Side, but with modifications moving the alignment closer to I-5 in some locations. It has the option for a station at 220th Street SW.

2.2.3 Segment C

The Preferred Alternative is similar to Alternative C3, along I-5 to Lynnwood Park-and-Ride, and maintains the existing transit center but is modified to better connect

to the Lynnwood Transit Center, preserve re-developable areas, and minimize wetland and stream impacts.

2.3 No Build Alternative

The No Build Alternative provides a basis for comparing impacts among alternatives, as required under NEPA and SEPA. It represents the transportation system and environment as they would exist without the proposed project. The No Build Alternative assumes other committed highway, transit, and nonmotorized projects identified in PSRC's *Transportation 2040* as amended in 2013, but without a major transit investment between Northgate and Lynnwood. The No Build Alternative also assumes population and employment growth as estimated by PSRC through 2035. For this Final EIS, the No Build Alternative and other alternatives incorporate recent population and growth estimates from PSRC's update in 2014; these updated assumptions are generally similar to those used for the Draft EIS.

The planned Sound Transit improvements that are included in Transportation 2040, and which are funded under ST2, comprise the Northgate Link Extension; the East Link Extension to Overlake in Redmond; the Federal Way Link Extension, which ST2 funds to the vicinity of Highline Community College in Des Moines; and service and access enhancements to the Sound Transit Express regional bus and Sounder commuter rail systems. *Transportation 2040* and ST2 also include a new operations and maintenance satellite facility for the expanded light rail system.

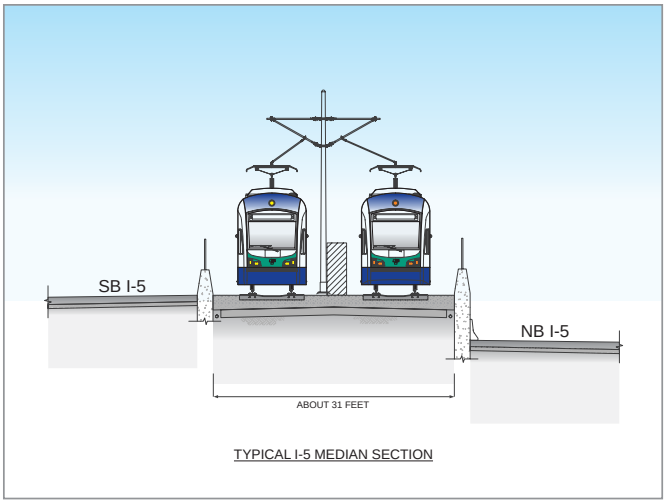
Minor local bus service additions by both King County Metro and Community Transit are also expected; however, the overall bus network and its service levels are assumed to remain similar to today.

Other projects identified in *Transportation 2040* and assumed in the No Build Alternative include the SR 520 Bridge Replacement and HOV program, and the SR 99 Alaskan Way Viaduct Replacement Program.

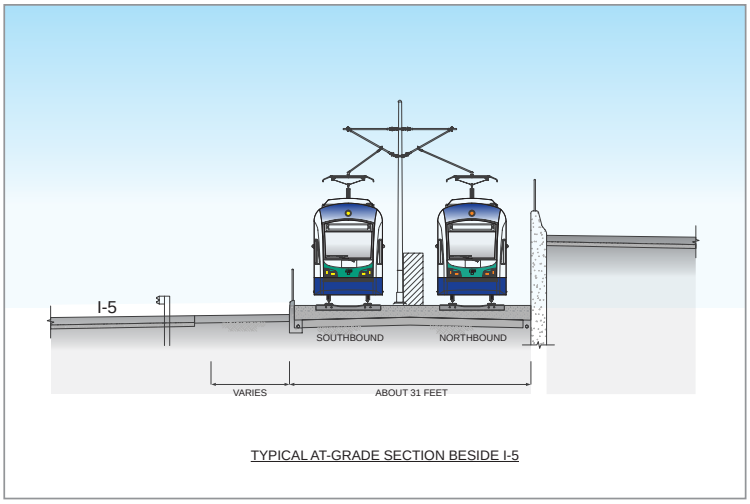
2.4 Typical Features of the Light Rail Alternatives

All light rail alternatives would operate in exclusive rights-of-way. This would also allow the fast and frequent service needed to serve the project corridor, with trains as often as every 4 minutes and track speeds of up to 55 mph.

Light rail would operate in a mix of surface (at-grade) and elevated configurations to address the project corridor's rolling terrain. In many locations, the alternative routes follow the general grade of I-5, with different profiles to allow the light rail guideway to cross over or under highway bridges, streets, or other physical obstacles. Figure 2-2 shows the typical features of at-grade and elevated guideways and stations.



TYPICAL I-5 MEDIAN SECTION



TYPICAL AT-GRADE SECTION BESIDE I-5

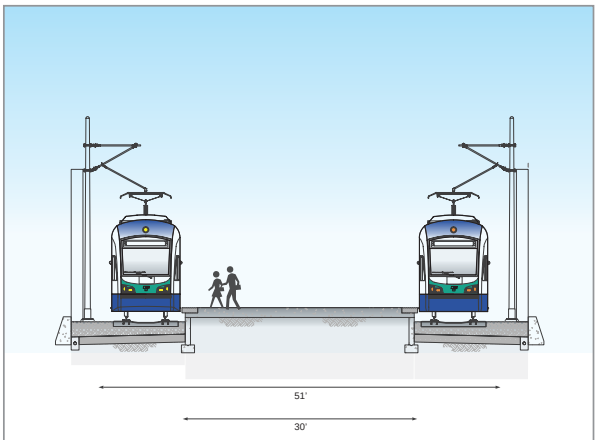
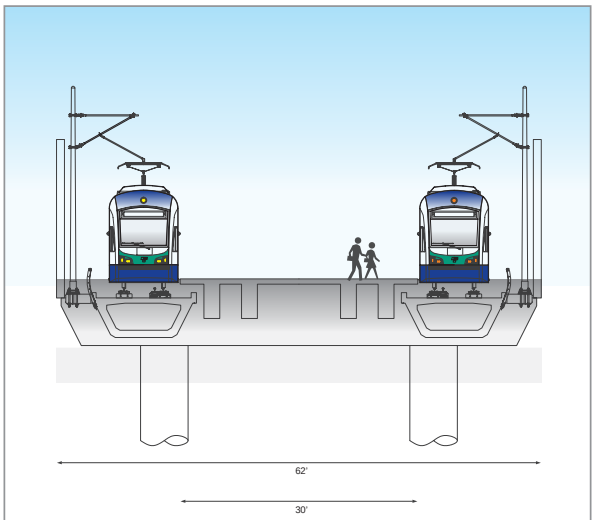
TYPICAL AT-GRADE SIDE PLATFORM STATION BESIDE I-5



TYPICAL AT-GRADE CENTER PLATFORM STATION BESIDE I-5



TYPICAL ELEVATED CENTER PLATFORM STATION

Figure 2-2
Typical Light Rail Guideways and Stations

To help define where at-grade or elevated guideways would be appropriate (and also to evaluate other profile choices such as tunnels or street-running light rail), Sound Transit has developed criteria that consider (1) topography, (2) physical barriers, (3) available surface right-of-way, (4) operating needs, (5) development density, and (6) cost. Environmental impacts and safety are also considered. Where an alignment is in the interstate right-of-way, Sound Transit must comply with highway design standards and Federal Highway Administration (FHWA) regulations.

At-grade guideways are best suited for areas where the grade is 5 or 6 percent or less and where sufficient right-of-way is available. While "at-grade guideway" typically refers to ground level, it also includes retained cut-and-fill structures that are used to maintain a consistent grade.

Elevated structures are appropriate where the topography varies more widely or creates barriers, where the light rail system must cross over other physical barriers such as cross streets and freeway lanes, where the available right-of-way is limited, or where grade separation is required for high-frequency train service. Tunnels may be options in areas with slopes of more than 5 or 6 percent; where physical barriers must be crossed; where the right-of-way is inadequate; in areas of high building density; or in areas of high train frequency. Tunnels may also be appropriate where major ridership centers cannot be served in any other way.

For the Lynnwood Link Extension, the frequent train service needed to accommodate the line's high ridership levels requires a guideway within an exclusive right-of-way. In addition, because of terrain, limited right-of-way, frequent cross streets, or other barriers, both at-grade and elevated sections are needed.

Whether elevated or at-grade, the light rail guideways are typically 30 to 40 feet wide, with room for two sets of tracks. This width also includes room for the poles and overhead catenary (contact wire) needed to power the trains. Many sections also contain space for emergency access as well as walls or barriers that restrict unauthorized access.

Because light rail would operate mostly in the I-5 right-of-way, the choice of alignments reflects highway maintenance and operation needs, as well as potential future improvements. To develop the proposed alignment alternatives, Sound Transit consulted with FHWA and WSDOT, which have jurisdiction over any project developed within the I-5 right-of-way.

Light Rail Stations

This Final EIS evaluates the potential for the proposed project to develop four to six light rail stations to serve the major transit markets in the project corridor. The Preferred Alternative has four stations, with two other optional stations. The stations would be either elevated or at-grade according to their site conditions and

the design needs for the connecting guideway; however, the station designs have common features.

Boarding platforms would be approximately 380 feet long to serve four-car trains, and located either on the outer side of the tracks or in the center with tracks on both sides. Escalators, elevators, and stairs would be provided to access the platforms. All stations would meet the standards of the Americans with Disabilities Act (ADA). They would include pedestrian and bicycle access to and from feeder bus lines, park-and-ride facilities, and surrounding streets, and would satisfy all applicable public access, fire, and life-safety requirements. For safety purposes, the trains would sound warning bells when they enter or leave a station. Each station would have at least one bicycle storage area with space for expansion.

Most of the stations would have parking areas for transit patrons in either a structure or a surface lot, including some surface lots leased from other parties. At several station locations, the existing transit facilities already include park-and-ride lots that would be expanded or reconfigured, including surface lots that would be converted to parking garages. Some stations or garages could also be built to allow commercial spaces or other transit-oriented developments, as long as these non-transportation elements are not in the I-5 right-of-way.

Example of a Traction Power Substation

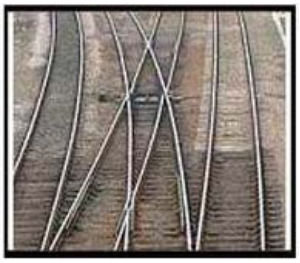
Other Facilities and Structures

Traction power substations along the project alignment would provide power to the overhead catenary (wire suspended above the light rail that provides electricity to the trains). These one-story structures are generally screened by a wall or fence, and sited at stations or along or beneath the light rail guideway.

Light Rail Train with Overhead Catenary Wires in Tukwila, WA

Other structures would be required. Noise walls would be needed to avoid transit noise impacts. Much of the elevated guideway would have short (3 to 4 feet) noise walls incorporated into the guideway structure itself, although some locations would require higher noise walls built between the guideway and the noise receivers (homes or other buildings). At-grade guideways in areas with slopes would have retaining walls where the route cuts into an adjacent hillside. These retaining walls would also hold fill for the guideway. In a number of locations, noise walls would be placed on top of retaining walls. In other locations, Sound Transit would relocate existing WSDOT highway walls.

Some sections of the guideway would feature crossover tracks with switches to allow trains to safely pass from one set of tracks to the other during track maintenance, to bypass a stalled train, to turn the opposite direction, or to operate in the event of emergencies. At the terminus station, tail tracks would extend beyond the station platform to store trains that are leaving service or waiting to enter service.



Crossover Tracks

The project also includes stormwater management facilities such as detention or infiltration ponds, vaults, swales, or other bioretention facilities, or vegetated embankments along the corridor. Detention ponds vary in size, but could be 200 feet wide, and often require fencing.

Other structural features would include retaining walls in areas with steeper slopes, or where the walls are needed to hold fill.

2.5 Descriptions of Light Rail Alternatives by Segment

The following subsections describe key features of the light rail alternatives based on conceptual design information. Appendix F, Conceptual Plans, includes conceptual design drawings that show the key elements assumed for each light rail alternative's alignment and stations. The conceptual designs include the primary elements required to develop and operate a light rail alternative; landscaping, screening, and other design elements would be further detailed in later stages of project design. In addition, further design, mitigation planning, permitting, and construction-stage planning might identify other features needed for construction staging, construction access, utility work, and other infrastructure connections.

Finally, the alternatives described below reflect different combinations of key features for the project. The individual alternatives have some features, such as stations or localized design elements, which could work for other alternatives in a segment. This is particularly true in Segment A, where the alignments all remain along the east side of I-5, but there are different ways to approach the station design, profile, or structures for light rail; street modifications; parking areas; or other features. When it ultimately defines the project to be built, the Sound Transit Board could choose a combination of these elements different than those presented in this EIS.

Tables 2-1a, 2-1b, and 2-1c summarize the key features and options of each alternative; Figures 2-3 through 2-10 illustrate them.

Table 2-1a. Summary of Design Features for Segment A Alternatives

Cross Streets	Preferred Alternative At-grade/ elevated with NE 145th and NE 185th Stations	Alternative A1 At-grade/Elevated with NE 145th and NE 185th Stations	A3 Mostly Elevated with NE 145th and NE 185th Stations	A5 At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations	A7 Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations	A10 At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations	A11 Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations
NE 104th Street to Northgate Way	• Elevated guideway from NE 104th Street at Northgate, crossing over 1st Avenue NE	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Similar to Preferred Alternative

Table 2-1a. Summary of Design Features for Segment A Alternatives

Cross Streets	Preferred Alternative At-grade/ elevated with NE 145th and NE 185th Stations	Alternative A1 At-grade/Elevated with NE 145th and NE 185th Stations	A3 Mostly Elevated with NE 145th and NE 185th Stations	A5 At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations	A7 Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations	A10 At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations	A11 Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations
NE 185th Street	• Crosses in underpass east of NE 185th Street bridge, and realigns 5th Avenue NE (south of NE 185th Street) • NE 185th Street preferred station: at-grade • 500-car parking garage west of I-5, and realigns 5th Avenue NE (north of NE 185th Street) • Expands overpass for pedestrians	• At-grade station east of I-5, 500-car parking garage west of I-5 • Realigns 5th Avenue NE • Rebuilds NE 185th Street bridge	• NE 185th Street Station Option 2: elevated • 500-car park-and-ride east of I-5, east of station; either in surface garage or below grade with a surface-level bus plaza	• NE 185th Street Station Option 3: at-grade • Surface parking for up to 350 cars	• Same as Alternative A3	• Same as Alternative A5	• Same as Alternative A3
Preferred Alternative Options	• NE 130th Street Station Option • Shoreline Stadium parking garage at NE 185th Street						

Table 2-1b. Summary of Design Features for Segment B Alternatives

Cross Streets	Preferred Alternative East Side to Mountlake Terrace Transit Center to West Side	B1 East Side to Mountlake Terrace Transit Center to Median	B2A East Side to Mountlake Terrace Transit Center to West Side with 220th Station North Option	B4 East Side to Mountlake Terrace Freeway Station to Median
NE 185th Street to NE 195th Street	• Retained cut on east side • NE 195th Street pedestrian bridge reconstructed	• Retained cut or elevated east side (depends on Segment An alternative) • NE 195th Street pedestrian bridge reconstructed	• Similar to Preferred Alternative	• Same as Alternative B1
NE 195th Street to Ballinger Way/SR 104 overpass	• Elevated on east side of I-5	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Similar to Preferred Alternative
Ballinger Way/SR 104 overpass	• Elevated • Crosses over Ballinger Way/SR 104 interchange	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Similar to Preferred Alternative but more to the west
Ballinger Way/SR 104 overpass to 236th Street SW	• Elevated east side	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Crosses over 236th Street SW northbound I-5 off-ramp and northbound I-5 lanes • Drops to median at-grade and crosses under 236th Street SW overpass
236th Street SW overpass	• Mountlake Terrace Transit Center Station: elevated • Station straddles 236th Street SW • Existing surface lot reconfigured	• Similar to Preferred Alternative	• Similar to Preferred Alternative	• Crosses under 236th Street SW overpass • Mountlake Terrace Freeway Station: reconstructs and extends current bus station • New north end station pedestrian bridge

Table 2-1b. Summary of Design Features for Segment B Alternatives

Cross Streets	Preferred Alternative East Side to Mountlake Terrace Transit Center to West Side	B1 East Side to Mountlake Terrace Transit Center to Median	B2A East Side to Mountlake Terrace Transit Center to West Side with 220th Station North Option	B4 East Side to Mountlake Terrace Freeway Station to Median
236th Street SW to 220th Street SW overpass	• Continues north elevated • Crosses I-5 lanes to west side and descends to near freeway grade, crossing under 228th Street SW • Transitions to elevated south of 220th Street SW • Elevated over 220th Street SW, reconstructs southbound I-5 ramps	• Continues north elevated • Short section retained cut in hillside north of Mountlake Terrace Transit Center • Crosses over northbound I-5 lanes • Enters freeway median, drops to grade near 232nd Street SW • At-grade in median under 220th Street SW overpass	• Similar to Preferred Alternative to south of 220th Street SW • Elevated with 220th Street SW Station elevated over the street • 200-space parking garage north of 220th Street SW	• Drops to median and runs at-grade north of the freeway station • Continues at-grade in median under 220th Street SW
220th Street SW to 212th Street SW	• Curves to east side of 60th Avenue West • Elevated along west side of I-5 with at-grade retained cut/fill section • Crossover tracks south of 212th Street SW • Crosses over 212th Street SW	• At-grade in median • Crossover tracks south of 212th Street SW	• Similar to Preferred Alternative but with differences in alignment for station configuration	• Same as Alternative B1
Options	• 220th Street Station South Option, south of street with 200-car surface lot, with alignment shifting west to the station; no modification to I-5 ramps	• Parking garage on existing surface lot at Mountlake Terrace Transit Center, adding about 280 spaces		

Table 2-1c. Summary of Design Features for Segment C Alternatives

Cross Streets	Preferred Alternative West Side to Lynnwood Transit Center Station	C1 52nd Avenue West to 200th Street SW Station	C2 52nd Avenue West to Lynnwood Transit Center Station	C3 Along I-5 to Lynnwood Park-and-Ride Station
Option 1: From I-5 median	• Continues at-grade in median • At about 208th Street SW, transitions to cross over southbound I-5 • Crosses Interurban Trail	• Transitions from at-grade in median near 210th Street SW; elevated guideway to cross southbound I-5 lanes to 52nd Avenue West • Continues elevated north along east side of 52nd Avenue West	• Same as Alternative C1	• Continues at-grade in median • At about 208th Street SW, transitions to cross elevated over southbound I-5 lanes, and reconstructs a portion of 208th Street SW where alignment crosses over it • Crosses Interurban Trail
Option 2: From west side of I-5	• Elevated west side of I-5 • Alignment gradually shifts away from I-5 after 208th Street SW • Crosses Interurban Trail	• Elevated along west side of I-5 until it approaches 52nd Avenue West • Turns north, elevated along east side of 52nd Avenue West	• Same as Alternative C1	• Similar to Preferred Alternative
52nd Avenue West	• Not applicable	• Elevated along east side of 52nd Avenue West • Turns east over corner of Scriber Creek Park at 200th Street SW • Crosses Interurban Trail	• As elevated guideway approaches 204th Street SW, alignment turns NE and crosses south of Scriber Creek Park • Crosses Interurban Trail	• Not applicable
Lynnwood Transit Center	• Elevated Lynnwood Transit Center station (diagonally across 46th Avenue West) • New garage replaces surface parking and adds 500 spaces, for 1,900 total spaces at the park-and-ride • Existing bus transit center remains • Option to maintain 400 spaces of surface parking, providing 2,300 total spaces • Tail tracks over 44th Avenue West	• Elevated along south side of 200th Street SW • Elevated 200th Street SW Station • 2 garages add 500 spaces to the existing park-and-ride	• Elevated Lynnwood Transit Center station south of 48th Street West and existing transit center • New garage replaces surface parking and adds 500 more spaces	• Lynnwood Park-and-Ride light rail station (south of 48th Avenue West, east of existing direct access ramp): elevated • New garage replaces surface parking and adds 500 spaces • Station Option 1: Existing bus transit center remains • Station Option 2: Existing bus transit center relocated

2.5.1 Segment A: Seattle to Shoreline

The Segment A alternatives reflect choices about the location of stations (at NE 130th Street, NE 145th Street, NE 155th Street, or NE 185th Street) as well as the number of stations (two or three). The station locations and height and location of existing street overcrossings of I-5 also largely influence whether the alignment is at-grade or elevated at a given location.

Preferred Alternative: At-grade/Elevated with NE 145th and NE 185th Stations

The Preferred Alternative (Figure 2-3) is an at-grade/elevated alignment with stations at NE 145th Street and NE 185th Street. It is similar to Alternative A1 from the Draft EIS, but in some locations the Preferred Alternative incorporates features from other alternatives, as well as design refinements to help minimize impacts or improve performance. It would begin alongside 1st Avenue NE, south of the I-5 ramps for Northgate, and connect to the tail tracks Sound Transit is constructing for the Northgate Link Extension. The elevated guideway would cross over 1st Avenue NE and stay elevated to about 115th Street NE, where it would descend to pass east of the NE 117th Street overpass and then continue along I-5. The existing pedestrian path connection at NE 116th Street would be reconstructed under the guideway and connected to NE 115th Street. The Preferred Alternative would realign a section of 3rd Avenue NE, which would maintain access for the Seattle Latvian Evangelical Lutheran Church. This alignment would generally run at-grade between 5th Avenue NE and I-5, typically at the same level as I-5, with short sections of retained cut or retained fill structures. It would replace the NE 130th Street off-ramp and the NE 130th Street bridge over I-5, relocating the ramp farther south and grade-separating it from southbound 5th Avenue NE, which would be rebuilt lower to go under the new off-ramp. The Preferred Alternative would rebuild the NE 130th Street and 5th Avenue NE intersection and adjacent street sections, including sidewalks and bicycle facilities.

The guideway would continue along 5th Avenue NE and transition to an elevated structure to reach the elevated NE 145th Street Station on the north side of the street. This center platform station would have a parking structure with up to five levels and approximately 500 spaces. It would relocate the existing northbound on-ramp to I-5 to the north, creating a new signalized intersection on 5th Avenue NE. It would also close the existing transit ramps and freeway station.

The Preferred Alternative would transition to retained fill north of the NE 145th Street Station. It would then cross over NE 155th Street on an elevated guideway, continuing on retained cut-and-fill sections, including a retained fill section along the edge of Ridgecrest Park, with a realignment of a section of 1st Avenue NE south of the park. It would bridge over NE 175th Street and continue in a retained cut to under NE 185th Street. Sections of 1st Avenue NE would also be realigned near

NE 175th Street, and 5th Avenue/7th Avenue NE would be realigned south of NE 185th Street. There would be a center platform station in a retained cut just north of NE 185th Street, with the alignment crossing under the street to reach the platform. A surface plaza would be above the platform, and access driveways would be to the east near 8th Avenue NE. A 500-space park-and-ride garage with about four levels would be west of I-5, which would require realigning 5th Avenue NE north of NE 185th Street. The NE 185th Street overpass would be widened to better serve pedestrian trips between the station and the parking garage.

Options for the Preferred Alternative

NE 130th Street Station Option. This Final EIS also considers, as an option to the Preferred Alternative, a station just north of NE 130th Street that could be built as part of the project, or partly built and then completed for service later. It would be a center platform, retained-cut station, with the platform close to the level of I-5 and a street-level plaza along 5th Avenue NE and NE 130th Street. The station access plan assumes 100 park-and-ride spaces in a nearby existing lot.

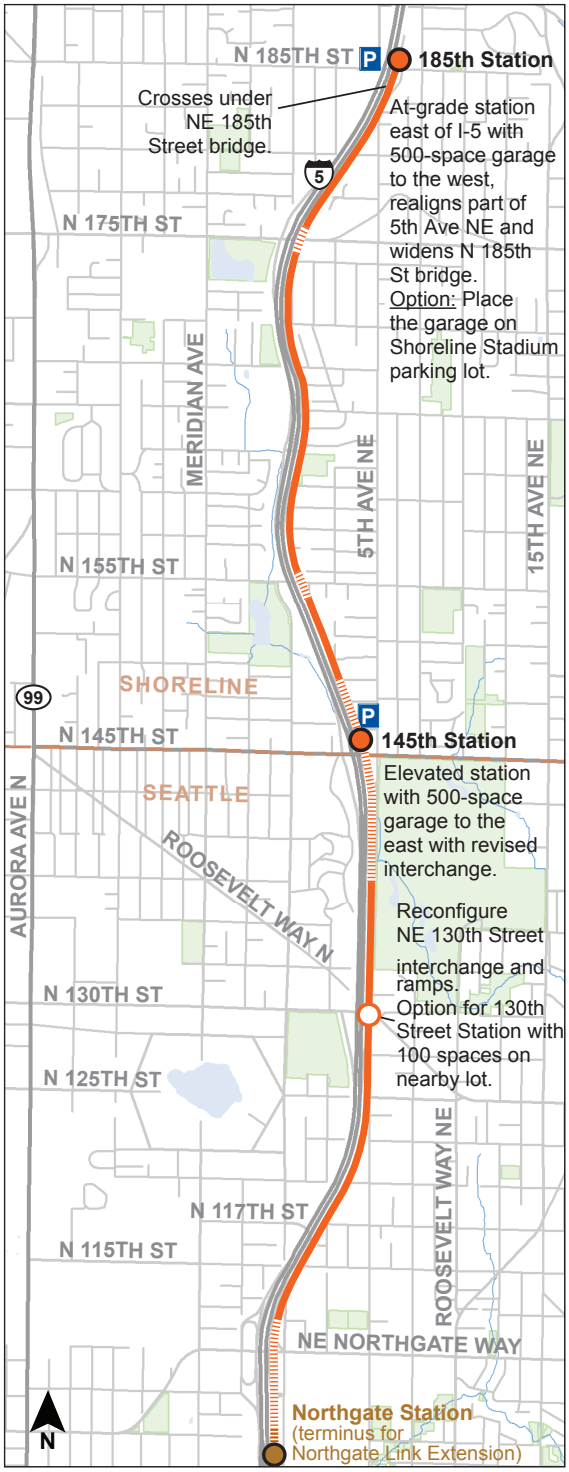
NE 185th Street/Stadium Parking Garage Option. Alternatively, the 500-space parking garage could be built at the existing Shoreline Stadium parking lot, instead of between I-5 and 5th Avenue NE.

Alternative A1: At-grade/Elevated with NE 145th and NE 185th Stations

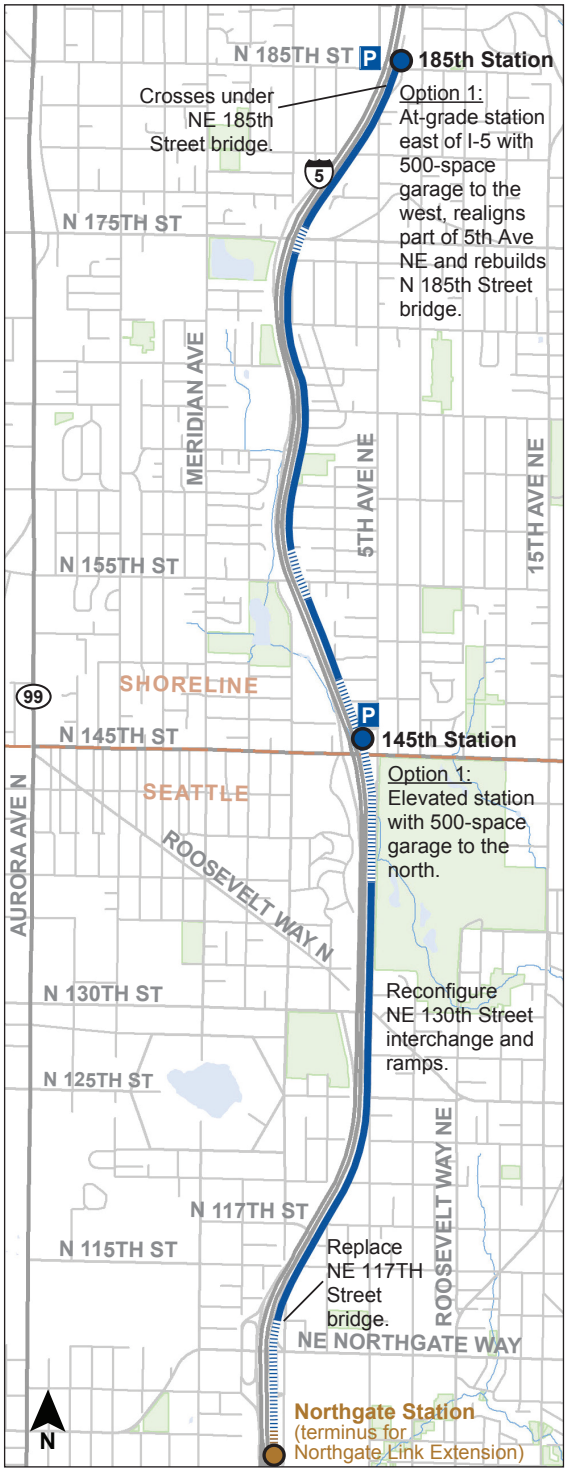
Alternative A1 (Figure 2-3) is similar to the Preferred Alternative, but it has different station options and design features in some locations. North of Northgate Way, it would stay closer to I-5 than the Preferred Alternative, crossing west of the NE 117th Street overpass, which would be realigned and rebuilt. Like the Preferred Alternative, this alternative maintains access for the Seattle Latvian Evangelical Lutheran Church by realigning 3rd Avenue NE. The alignment would then continue north, similar to the Preferred Alternative, up to NE 145th Street.

This alternative includes NE 145th Street Station Option 1, an elevated center-platform station, with a platform above the existing I-5 transit-only off-ramp and northbound on-ramp, and a ground-level plaza on the north side of NE 145th Street. To the north, a parking structure with up to three levels would provide approximately 500 spaces.

Alternative A1 would continue north, similar to the Preferred Alternative, up to just south of NE 185th Street, where it would include the NE 185th Street Station Option 1, which is similar to the Preferred Alternative's station but requires rebuilding the NE 185th Street bridge.



PREFERRED ALTERNATIVE SEGMENT A: AT-GRADE/ELEVATED WITH NE 145th AND NE 185th STATIONS



A1: AT-GRADE/ELEVATED WITH NE 145th AND NE 185th STATIONS

Elevated
At-Grade
Station
Station Option
Parking Structure
Surface Parking
Roadway
Local Street
City Boundary
County Boundary
Park
Waterbody

Figure 2-3
Preferred Alternative and Alternative A1

Alternative A3: Mostly Elevated with NE 145th and NE 185th Stations

Alternative A3 is similar to Alternative A1, but it would be elevated to the NE 145th Street Station (see Figure 2-4). It would cross over the existing NE 117th Street bridge and the NE 130th Street off-ramp and overpass, thus avoiding the need to rebuild these facilities. The NE 145th Street Station Option 2 is similar to the Preferred Alternative's station.

North of NE 145th Street, Alternative A3 would be similar to the Preferred Alternative until NE 175th Street, but would then continue on an elevated guideway to the NE 185th Street Station. It also would require a realignment of 1st Avenue NE near NE 175th Street and 5th Avenue NE near NE 185th Street. The NE 185th Street Station Option 2 would be elevated, and to the east would be an approximately 500-stall parking garage and an integrated transit center with a circular transit driveway.

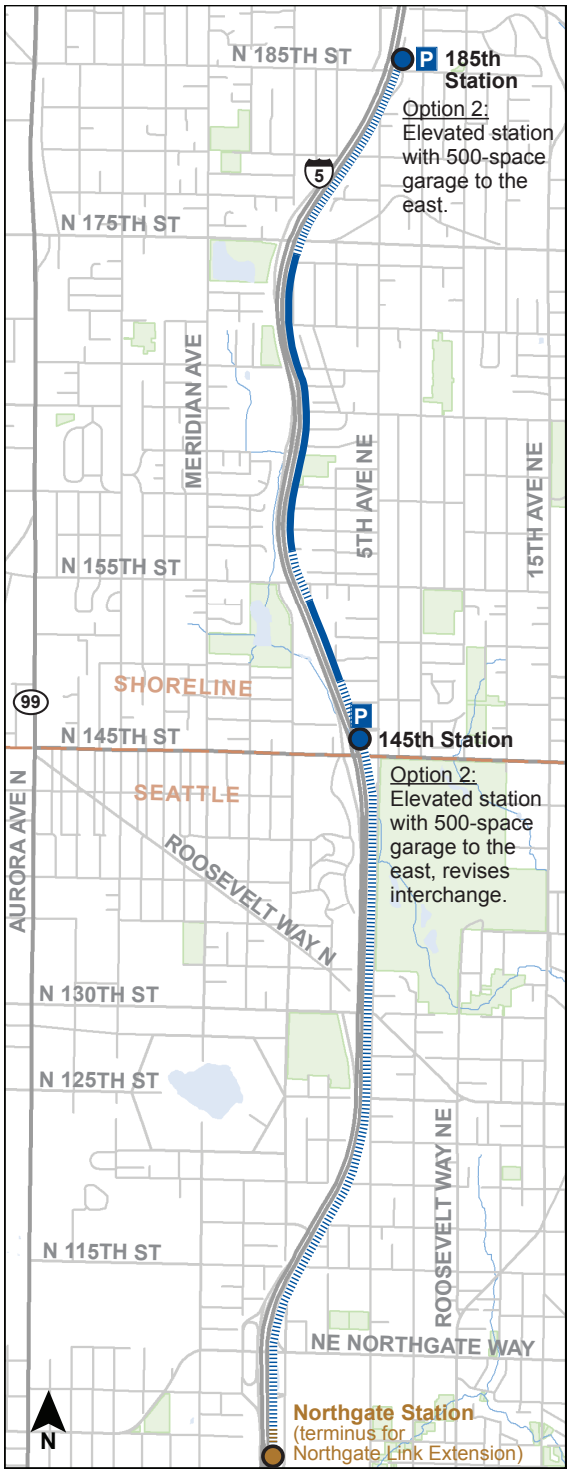
Alternative A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations

Alternative A5 is largely based on Alternative A1, but would feature stations at NE 130th Street and NE 155th Street (instead of a station at NE 145th Street), and with a third configuration for the NE 185th Street Station (see Figure 2-4). It also would cross at-grade east of the NE 117th Street overpass (similar to the Preferred Alternative), thus avoiding the need for rebuilding the bridge. Like Alternative A1, it would rebuild the NE 130th Street I-5 off-ramp and overcrossing, including the 5th Avenue NE intersection and roadway.

The NE 130th Street Station Option 1 is the same as the option described for the Preferred Alternative.

The route would continue on retained fill, before moving to an elevated section near Jackson Park Golf Course, similar to Alternative A1. Except for a short section in retained fill, it would continue elevated to a NE 155th Street Station, which would be next to the I-5 bridge over NE 155th Street. There would be a 500-space parking garage with up to four levels on the south side of NE 155th street.

This alignment would be the same as Alternative A1 from the NE 155th Street Station to the NE 185th Street Station Option 3, a retained-cut station under the NE 185th Street overpass, similar to Option 1 with Alternative A1, but without rebuilding the NE 185th Street overpass. It would include surface parking for approximately 350 vehicles on two lots east of this station.



A3: MOSTLY ELEVATED WITH NE 145th AND NE 185th STATIONS

Local Street
City Boundary
County Boundary
Park
Waterbody

Figure 2-4
Alternatives A3 and A5

Alternative A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations

Alternative A7 begins with the mostly elevated guideway alignment of Alternative A3, including elevated sections over the NE 117th Street overpass and the NE 130th Street off-ramp and bridge (see Figure 2-5). It has the same station locations as Alternative A5, but with the elevated Option 2 at NE 130th Street. There would be parking for approximately 100 vehicles north of the station and under the elevated guideway along 5th Avenue NE.

From NE 130th Street north to the station at NE 155th Street, the alignment would be the same as Alternative A5. From NE 155th Street, it would be the same as Alternative A3.

Alternative A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations

Alternative A10 (see Figure 2-5) is similar to the Preferred Alternative and Alternative A5 up to NE 130th Street. It would include the at-grade NE 130th Street Station Option 1, but with no parking. From NE 130th Street north to NE 145th Street, Alternative A10 would be the same as Alternative A1. North of NE 145th Street, Alternative A10 would be the same as Alternative A5.

Alternative A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations

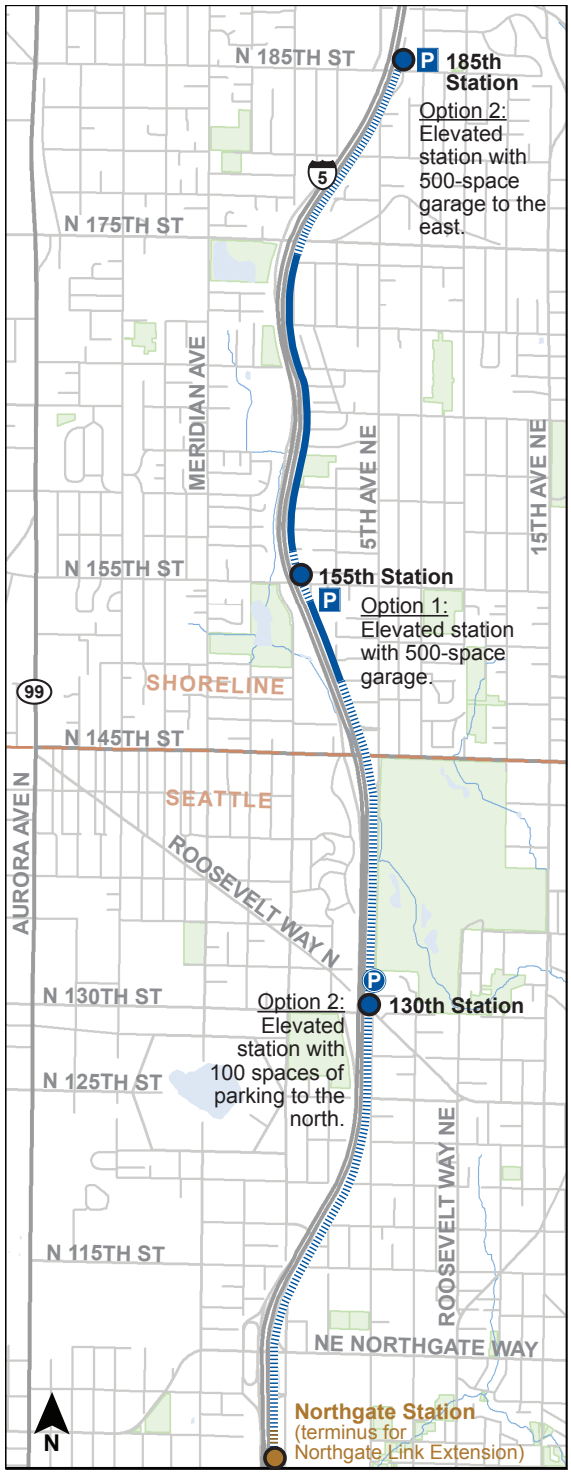
Alternative A11 is the same as Alternative A7, except with an elevated station at NE 145th Street (Station Option 2) instead of a NE 155th Street Station (see Figure 2-6).

2.5.2 Segment B: Shoreline to Mountlake Terrace

The Segment B alternatives feature a Mountlake Terrace Station location (at the current transit center or at its freeway station) and either use the freeway median or cross over to the west side of I-5. Two of the alternatives feature an additional station choice at 220th Street SW.

Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side

The Preferred Alternative modifies Alternative B2 from the Draft EIS to minimize impacts and improve operations. It would begin north of the NE 185th Street Station in a retained cut along the east side of I-5 (see Figure 2-7), crossing under the NE 195th Street pedestrian bridge, which would be replaced. It would continue mostly elevated to the north and cross over the Lake Ballinger Way/SR 104 interchange and over 236th Street SW to reach an elevated station at the Mountlake Terrace Transit Center, east of the existing parking garage. The station platform would straddle 236th Street SW. The south entrance would include a new path connecting to existing streets. To provide effective access at this station, including access for bus transit, Sound Transit would reconfigure the existing transit center's surface parking and circulation to the east of the current parking garage, while maintaining its parking capacity. The route would then continue north on an elevated structure, crossing over to the west side of I-5.



A7: MOSTLY ELEVATED WITH NE 130th, NE 155th AND NE 185th STATIONS

Figure 2-7
Preferred Alternative and Alternative B1

To reduce impacts on forested areas and a property designated for highway beautification purposes when I-5 was originally developed, Sound Transit has shifted the alignment lower on the hillside, mostly in a retained cut until just south of 220th Street SW. Then it would become elevated, continuing over 220th Street SW and realigning the I-5 southbound on-ramp and off-ramp slightly east. The alignment would then be elevated on the east side of 60th Avenue West, and along the west side of I-5, mostly on retained cut and fill structures, before crossing over 212th Street SW.

Option for the Preferred Alternative

An optional station could be located south of 220th Street SW, on a now-vacant parcel that previously housed an elementary school. The station and its 200-space parking lot could be developed as part of the project, or partially built and completed later. It would require shifting the alignment westward to reach the station and crossing elevated over 220th Street SW slightly west of the alignment for the Preferred Alternative, but would not require realigning the I-5 on-ramp and off-ramp.

Alternative B1: East Side to Mountlake Terrace Transit Center to Median

Alternative B1 is the same as the Preferred Alternative between NE 185th Street and the north side of the Mountlake Terrace Transit Center Station (see Figure 2-7).

From there, it would continue north on an elevated guideway, with a short section cut into the hillside north of the transit center. It would then cross over the northbound lanes of I-5, enter the freeway median, and drop to at-grade. The alignment would continue in the median of I-5 generally at the level of the southbound I-5 lanes, north to approximately 212th Street SW.

This alternative has an optional four-level parking garage on the existing Mountlake Terrace Transit Center surface lot to the east of the current garage, adding 280 stalls to the current 880.

Alternative B2A: East Side to Mountlake Terrace Transit Center to West Side with 220th Station North Option

Alternative B2A has the same alignment as the Preferred Alternative but would have a 220th Street SW Station above the street (see Figure 2-8), with a 200-stall parking garage to the north. It would require realigning the I-5 on-ramp and off-ramp for 220th Street SW.

Alternative B4: East Side to Mountlake Terrace Freeway Station to Median

Alternative B4 (see Figure 2-8) is the same as the Preferred Alternative from NE 185th Street Station north to approximately the overcrossing at the Lake Ballinger Way/SR 104 interchange. It would then transition to cross over the northbound I-5 lanes to the I-5 median and descend to cross under the 236th Street SW overpass and connect to the existing Mountlake Terrace Freeway Station, which would be extended to the north, retrofitted to accommodate light rail trains, and closed to bus

use. This side platform station would have a south entrance served by the existing pedestrian bridge. A new north entry to the station and pedestrian bridge would connect to the east, crossing over northbound lanes of I-5, with a second tower and pedestrian bridge rising in elevation to connect to 232nd Street SW. The other features of the existing transit center and its 880 parking spaces would be the same as today. The alignment would continue at-grade in the I-5 median to approximately 212th Street SW, similar to Alternative B1.

2.5.3 Segment C: Mountlake Terrace to Lynnwood

The Segment C alternatives involve choices for different routes to reach the Lynnwood Transit Center, as well as different station siting and park-and-ride configurations. These alternatives are shown in Figure 2-9 and Figure 2-10.

Preferred Alternative: West Side to Lynnwood Transit Center Station

The Preferred Alternative (see Figure 2-9) is a modified version of Alternative C3. It realigns the guideway and station to better connect to the Lynnwood Transit Center, preserve more redevelopable area, and minimize wetland and stream impacts to the extent feasible.

From Segment B, where it would already be elevated on the west side of I-5, it would shift away from I-5 north of 208th Street SW. At about 208th Street SW, the route would cross the Interurban Trail right-of-way and then head generally north toward the south side of the existing transit center. The station would be over 48th Avenue SW, and cross diagonally into the block bounded by 44th Avenue West, 48th Avenue West, and 200th Street SW. Crossover tracks and a trail track would curve eastward to align with 200th Street SW, cross over 44th Avenue West, and end, still elevated, on the south side of Alderwood Mall Boulevard.

A parking garage (up to four levels) would be built partly over an existing park-and-ride lot between the HOV direct access ramps (to the west) and 44th Avenue West (to the east). It would connect to the station as well as the existing bus transit center to the west of 48th Avenue NE. The 1,650-space garage would replace current parking spaces and add approximately 500 new spaces, for a total park-and-ride capacity of about 1,900 spaces. An existing park-and-ride lot north of the current transit center would be repurposed to provide bus layover and circulation. To provide effective access to the station, 200th Street SW and 48th Avenue West would be widened, and 46th Avenue West would have HOV-only restrictions.

An option for the Preferred Alternative would maintain 400 spaces on the existing surface parking lot to the south of the existing transit center, rather than converting the area for bus layover and circulation, for a total of 2,300 parking spaces at the park-and-ride. Bus layover and circulation would instead occur just north of the transit center.

Figure 2-10
Alternatives C2 and C3

Alternative C1: 52nd Avenue West to 200th Street Station

Alternative C1 (see Figure 2-9) begins with two alignment options to connect with Segment B alternatives. Alignment Option 1 connects to the I-5 median (to Alternative B1 or B4). After crossing the I-5 southbound lanes, it would remain elevated along the east side of 52nd Avenue West and Cedar Valley Road. Alignment Option 2 would continue elevated on the west side of I-5 (connecting to the Preferred Alternative and B2A) to 52nd Avenue West, before turning north and crossing over the Interurban Trail. Alternative C1 would then turn east over the corner of Scriber Creek Park and along the south side of 200th Street SW and arrive at the elevated 200th Street SW Station, east of 48th Avenue West.

South of the station, two new two-story parking garages would increase the existing parking by 500 spaces for a total of 1900 spaces. Elevated tail tracks would continue approximately 800 feet east to 44th Avenue West.

Alternative C2: 52nd Avenue West to Lynnwood Transit Center Station

Alternative C2 (see Figure 2-10) and its options are the same as Alternative C1 until crossing over the Interurban Trail around 208th Street SW. As Alternative C2 approaches 204th Street SW, it would turn northeast on an elevated guideway and cross south of Scriber Creek Park to the Lynnwood Transit Center Station. This elevated, center platform station would be south of 48th Avenue NW and the existing Lynnwood Transit Center. A new, approximately 1,200-space parking garage (up to four levels) would replace the surface lot spaces displaced by the station and increase the existing park-and-ride capacity by 500 spaces, for a total of about 1,900 spaces. Tail tracks, with a crossover track, would extend 800 feet beyond the station to 44th Avenue West.

Alternative C3: Along I-5 to Lynnwood Park-and-Ride Station

Alternative C3 also features two options for connections to Segment B alternatives (see Figure 2-10). Alignment Option 1 would continue northward along I-5 at-grade in the median (matching Alternative B1 or B4), transition to an elevated guideway at about 208th Street SW, and then cross over the southbound I-5 lanes and angle away from I-5. Alignment Option 2 would already be elevated on the west side of I-5 (matching Alternative B2 or B2A) and more gradually shift away from I-5 north of 208th Street SW. At 208th Street SW, the Alternative C3 route would cross the Interurban right-of-way and parallel I-5 to the Lynnwood Park-and-Ride Station south of 48th Avenue SW and east of the existing Lynnwood direct access ramp.

Two design options are being considered for the Lynnwood Park-and-Ride Station. Both of these options feature an elevated, center platform station west of the Interurban Trail. The station would include a parking garage (up to four levels) to the west, south of the existing transit center, which would replace current spaces and add approximately 500 new spaces, for a total park-and-ride capacity of about 1,900

spaces. Both design options also feature a guideway containing tail tracks extending about 800 feet northeast over 44th Avenue West.

With Station Option 1, the existing transit center would remain at its current location. The elevated, center platform station would have surrounding open spaces, as well as a large plaza area with a pathway to the northwest toward the existing transit center.

Station Option 2 would be the same except that the existing transit center with 20 bus bays would be relocated adjacent to the light rail station, with transit driveways on and off of 48th Avenue NW, which would be converted to transit-only access.

2.5.4 Light Rail Operations

The light rail alternatives would operate consistent with Sound Transit's current long-range Link service plan, which accommodates the Lynnwood Link Extension and other planned light rail expansions through 2030. Sound Transit would run weekday revenue service with four-car trains at the scheduled frequency shown in Table 2-2.

Table 2-2. Operating Plan for Weekday Service[a]

Service Period	Hours	Train Frequency
Early Morning	5:00 am to 6:00 am	7.5 minutes
Morning Peak	6:00 am to 8:30 am	4 minutes
Midday	8:30 am to 3:00 pm	5 minutes
Afternoon Peak	3:00 pm to 6:30 pm	4 minutes
Evening	6:30 pm to 10:00 pm	5 minutes
Evening Late Night	10:00 pm to 1:00 am	7.5 minutes

[a] Sound Transit also runs several non-revenue trains before and after the service day for maintenance and operation purposes.

2.5.5 Construction Approach

Pre-construction investigations during final design would include geotechnical and/or exploratory investigations to detect unmapped utilities, culverts, or other infrastructure. Some advance utility upgrades or relocations would also occur. Project construction and pre-operations testing activities would last approximately 6 years overall, but in many locations the major construction activities would last about 2 years. Although more detail on the specific construction approaches and methods would be developed when the project enters final design, this Final EIS impact analysis covers the most likely major activities, as described below.

Sound Transit would need several sites to stage construction activities. These areas would have a range of activities and uses, such as construction office trailers; temporary storage of demolition materials for salvage, sorting, and recycling; and

excavated soils storage. Staging areas would also be used to load and unload trucks, store equipment and materials, and allow parking for construction workers. Sound Transit would need access routes for construction areas not readily accessible from existing roadways. Where possible, Sound Transit would locate construction activities on staging areas proposed for use by light rail (some of which is WSDOT right-of-way). Some of these sites may require vegetation removal, clearing, and grading, as well as temporary retaining structures or barriers. Appendix F, Conceptual Plans, shows anticipated construction staging areas.

Construction activities and their approach vary by the type of light rail facilities to be built for a given alternative. Different approaches would be required for:

- At-grade guideways
- Retained cut and fill guideways
- Elevated guideway structures, particularly structures spanning I-5
- Passenger stations
- Park-and-ride facilities
- Traction power substations, and communications and signal control facilities
- Other related improvements such as roadways, sidewalks, noise walls, utility relocations, and drainage and stormwater facilities
- Power transmission line relocations

The first phase of any construction work begins with site preparation. This would include erosion, sediment, and stormwater control measures; sensitive-area protection measures; demolition of structures; and re-routing of utilities. Next, construction of the alignment begins, followed by installation of the guideway. Stations and parking facilities can be constructed concurrently with the guideway if those sites are not needed for staging areas.

Construction activity would be highest during the heavy civil construction period of the project. Elevated guideways, station areas, earthwork, and retaining wall construction typically generate the most intense construction activity because they require greater volumes of materials, equipment, and personnel. Station finishes, system installation, and testing, would be less intense, confined to smaller areas, and generally involve fewer workers.

Sound Transit typically constructs guideways and stations in segments in a linear fashion. In any given location, most of the major civil construction activities would be completed in one year, although stations, park-and-rides, and complex sections can take longer. Sound Transit would avoid major construction late at night, early mornings, and on weekends, as practicable, but some locations and types of work might require exceptions. Elevated guideways and bridges over other roadways are

types of construction that would typically require major construction at night or early mornings on the weekends, largely to minimize traffic impacts. Partial or full street closures as well as potential I-5 lane closures are possible. These temporary closures are discussed in more detail in Chapter 3, Transportation Impacts and Mitigation. Throughout construction, Sound Transit would coordinate closely with local jurisdictions, FHWA and WSDOT, affected residents and neighborhoods, affected commercial and industrial businesses, utility providers, institutions, and other affected local and state agencies to help minimize impacts and disruptions or inconveniences.

As construction is completed, control systems would be installed and tested. Once those are tested and commissioned, the transit system opens to riders.

Potentially Deferred Stations

The Preferred Alternative has options for stations at NE 130th Street and 220th Street SW. If these stations were added to the project, they could be completed with initial construction, or they could be deferred and completed in the future. A deferred station would require some initial station construction activities prior to the opening of the line, followed later by the construction of the balance of the station. Elevated stations have the largest percentage of work that could be deferred to a future stage. In all cases, enough of the station structure must be completed initially so that future construction to complete the station can proceed without interfering with normal operation of the light rail line. Construction activities and impacts would be split into two periods in this case.

2.6 Alternatives Development

Sound Transit developed the alternatives being considered in this Final EIS through a public planning process that dates back many years. The ST2 Plan, financing for which was approved by voters in 2008, was a major step in defining the general scope for a project connecting Northgate to Lynnwood. ST2 defined the project as part of a larger program to expand the regional mass transit system in Snohomish, King, and Pierce counties.

The start of the EIS phase for the Lynnwood Link Extension was built on ST2 planning and the results of an Alternatives Analysis Sound Transit performed in 2010 and 2011 that included early public and agency scoping, which began in October 2010. The Alternatives Analysis considered a broad range of alternatives in order to comply with the federal regulations and guidelines then in place for projects seeking funding from FTA's New Starts program. It resulted in the September 2011 North Corridor Transit Project *Alternatives Analysis Report and SEPA Addendum* (Sound Transit 2011a) (attached as Appendix K to this Final EIS) that identified the most promising alternatives for further study, as well as serving as an addendum to Sound Transit's 2005 *Supplemental EIS on the Regional Transit Long-Range Plan*. The

Alternatives Analysis Report and SEPA Addendum reviewed the project corridor's long planning history and considered in detail a wide range of alternatives and their performance. The North Corridor Transit Project *Environmental Scoping Information Report* summarized the process and its conclusions. Both documents were available during public scoping for the Draft EIS.

Through several stages of detailed study in the Alternatives Analysis, Sound Transit evaluated light rail, bus rapid transit, and transportation systems management alternatives. Sound Transit weighed each alternative's ability to meet the project's purpose and need, considering factors such as ridership and transportation performance, land use, community equity, environmental effects, total cost, cost effectiveness, and constructability. The final set of alternatives considered in the Alternatives Analysis featured an I-5 light rail alternative, two SR 99 alternatives (one with at-grade sections and one fully elevated), and a three-prong bus rapid transit alternative running on I-5, SR 99, and 15th Avenue NE. The final evaluation showed the light rail alternatives would have nearly twice the ridership of the bus rapid transit alternative. Light rail had higher capital costs than bus rapid transit, but would perform better in terms of cost per rider and annual operating costs. Finally, the bus rapid transit alternative had less capacity, and gaps in the HOV system from Northgate to downtown Seattle made it less reliable. The SR 99 alternatives produced more severe impacts and less transportation benefit, and had more constructability issues.

Figure 2-11 charts the alternatives evaluation and screening process and identifies the alternative concepts that were not advanced from the Alternatives Analysis through the start of the Draft EIS. Table 2-3 describes why specific alternatives considered for the Draft EIS were eliminated from consideration.

The Alternatives Analysis found that light rail must operate in an exclusive right-of-way with full separation from other traffic in order to provide the capacity, reliability, and travel time savings needed to address the growing demand for mass transit in the project corridor.

As a result, Sound Transit concluded that light rail along the I-5 corridor would offer the best overall performance across the broad set of evaluation criteria, including ridership and transportation performance, consistency with regional land use plans, and cost-effectiveness.

After the public scoping comment period, the Sound Transit Board reviewed the comments received and the *Alternatives Analysis Report and SEPA Addendum*. In December 2011, the Sound Transit Board approved Motion M2011-87, which directs Sound Transit to study light rail alternatives along I-5 in the EIS and removed the other modes and corridors considered in the Alternatives Analysis from further study. This included routes and stations along SR 99 and 15th Avenue NE, bus

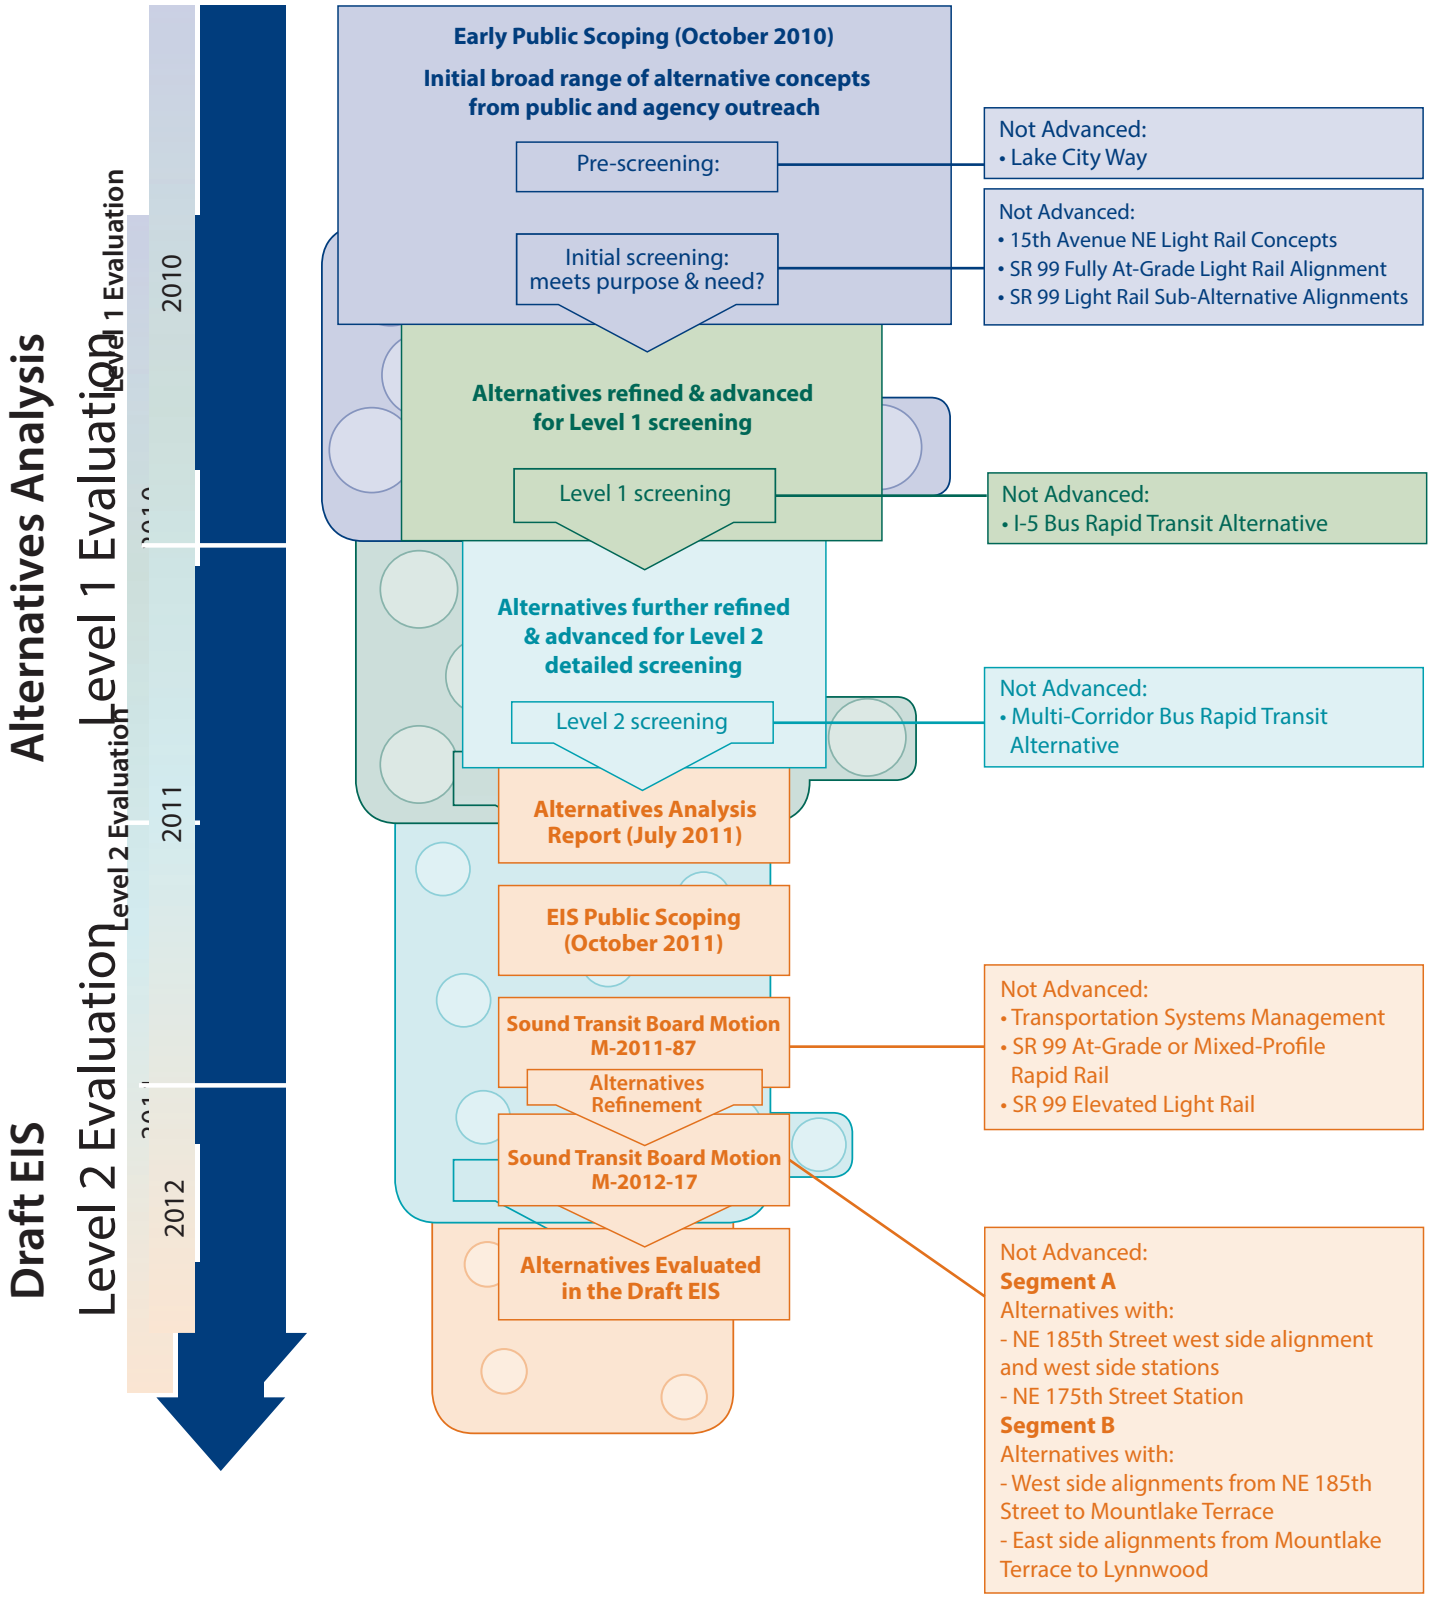

Figure 2-11
Alternative Evaluation and Screening Summary

Table 2-3. Alternatives Eliminated by Sound Transit Board

Alternative	Areas of Poor Performance
A2: At-Grade/Elevated to NE 145th East Side and NE 185th West Side Stations	**Environmental Effects:** Higher potential for visual and historic impacts; west side alignment increases impacts into Segment B **Constructability:** Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; adds another I-5 crossing in Segment B
A4: Mostly Elevated to NE 145th East Side and NE 185th West Side Stations	**Environmental Effects:** Higher potential for visual and natural resources impacts; west side alignment increases impacts into Segment B **Constructability:** Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; adds another I-5 crossing in Segment B
A6: At-Grade/Elevated to NE 130th and NE 155th East Side and NE 185th West Side Stations	**Environmental Effects:** Higher potential for historic and visual impacts; west side alignment increases impacts into Segment B **Constructability:** Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; adds another I-5 crossing in Segment B
A8: Mostly Elevated to NE 130th and NE 155th East Side and NE 185th West Side Stations	**Environmental Effects:** Higher potential for noise, historic, and visual impacts; west side alignment increases impacts into Segment B **Constructability:** Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5; adds another I-5 crossing in Segment B
A9: At-Grade/Elevated to 145th and 175th East Side Stations	**Transportation Performance:** Slower bus and auto travel times due to higher congestion at interchange, lower levels of bus access, and less desirable pedestrian and bicycle environments **Environmental Effects:** Higher congestion due to park-and-ride at an interchange; property and visual impacts to residential areas **Constructability:** More complex construction due to proximity with interchange
B3: East Side to Mountlake Terrace Transit Center to East Side	**Environmental Effects:** Higher potential for noise, visual, and ecosystems impacts due to section located through a greenbelt **Right-of-Way Implications:** More properties needed outside of I-5 right-of-way
B5: West Side to Mountlake Terrace Freeway Station to Median	**Transportation Performance:** Increased walk distance between station platform and parking/bus transfer at Mountlake Terrace; worse platform waiting environment **Ridership Potential:** Reduced due to longer walk distance **Environmental Effects:** Higher potential for visual and ecosystems impacts along west side from NE 185th and from second pedestrian bridge **Constructability:** Substantially more difficult due to necessary design deviations, reduced speeds, and median construction for proposed Mountlake Terrace freeway station
B6: West Side to Mountlake Terrace Transit Center to Median	**Environmental Effects:** Higher potential for visual impacts from sections along the west side of I-5 and at transition to the east side approaching Mountlake Terrace Transit Center **Constructability:** Substantially more difficult due to staging constraints and traffic impacts related to crossing I-5 **Right-of-Way Implications:** Higher potential for property impacts from the west-to-east I-5 crossing
B7: West Side to Mountlake Terrace Transit Center to West Side	**Environmental Effects:** Notably higher visual impacts along west side from NE 185th Street; higher ecosystems and noise impacts due to transition back to west side and along greenbelt; higher ecosystems impacts near S. 212th Street **Constructability:** Substantially more difficult due to additional crossing of I-5 **Right-of-Way Implications:** More properties needed outside of I-5 right-of-way
B7A: West Side to Mountlake Terrace Transit Center to West Side with 220th Street Station	**Environmental Effects:** Notably higher visual impacts along west side from NE 185th Street; higher ecosystems and noise impacts due to transition back to west side and along greenbelt; higher ecosystems impacts near S. 212th Street; potential for historic impacts due to 220th Street Station **Constructability:** Substantially more difficult due to additional crossing of I-5 **Right-of-Way Implications:** More properties needed outside of I-5 right-of-way
B8: West Side to Mountlake Terrace Transit Center to East Side	**Environmental Effects:** Notably higher visual and ecosystems impacts along west side from 185th; higher visual, ecosystems, and noise impacts due to transition across I-5 and along greenbelt **Constructability:** Substantially more difficult due to additional crossing of I-5 **Right-of-Way Implications:** More properties needed outside of I-5 right-of-way

rapid transit, and extensions beyond the Lynnwood Transit Center. Light rail routes along SR 99 and 15th Avenue NE were eliminated because the Alternatives Analysis showed operating in mixed traffic would result in insufficient capacity, slow average speeds, and low reliability. Routes along SR 99 and 15th Avenue NE would not provide the type of regional service identified in the Sound Transit Long-Range Plan nor would the routes meet the project's purpose and need related to transportation effectiveness. Scoping comments from the public and agencies strongly supported further study of I-5 light rail alternatives, and not of the other modes.

Some comments received during scoping suggested different alternatives and/or station locations than those presented by Sound Transit. Sound Transit incorporated some of these suggestions into the alternatives evaluated in this EIS, such as NE 130th Street, NE 155th Street, and 220th Street SW stations. Other suggestions were not advanced because they were not consistent with the project's purpose and need or they would have lower effectiveness and higher environmental impacts. These suggestions are summarized in Table 2-4.

2.6.1 Factors Affecting the Range of Alternatives

In addition to Sound Transit's standard design considerations for light rail projects, several general planning, engineering, and environmental considerations shaped the development of alternatives for connecting Northgate and Lynnwood, from ST2 planning through to the alternatives evaluated in this EIS. These factors reflect the constraints posed by I-5 and its limited available right-of-way, as well as other community and environmental conditions along the project corridor.

- **Develop Alignment and Station Combinations that Minimize Environmental Impacts.** The general route and the specific alternative alignments were developed considering the location of the candidate station sites, along with environmental resources, such as major streams and wetlands, as well as built environment elements such as historic properties, parks, neighborhoods, and community facilities. The routes also maximized the potentially available transportation right-of-way from I-5 and adjacent city streets while maintaining the overall transportation utility of the I-5 right-of-way as a public asset.
- **Avoid the Impacts of Repeated I-5 Crossings.** I-5 crossings require costly crossing structures and cause higher impacts on properties and environmental resources near the freeway, as well as on I-5 operations and maintenance.

Table 2-4. Other Alternatives Suggested During Environmental Scoping

Suggested Alternatives	Reason Not Advanced
Consider stations along 15th Avenue NE at NE 145th Street and NE 175th Street.	15th Avenue NE alignment was removed because it would have higher environmental impacts and lower effectiveness; the narrow avenue along a developed corridor would not accommodate the stations and access levels needed to support the regional service identified in Sound Transit's Long-Range Plan.
Extend light rail to Alderwood Mall, Lynnwood Convention Center, 196th Street, Lynnwood City Center, or Ash Way, to serve more commuters or reduce traffic	An extension could be part of the future project, but it is not consistent with the current project scope, budget, or purpose and need. The project's limits from Northgate to the Lynnwood Transit Center were adopted by the Sound Transit Board and financing was approved by the voters in the region with the passage of the ST2 ballot measure in 2008.
Use Interurban Trail land for alignment.	The former Interurban right-of-way serves as a primary corridor for high voltage electrical transmission lines, and it has been developed as a trail for pedestrians and bicycles. These uses together with numerous areas where development has encroached on the right-of-way make it very difficult to integrate a light rail line without relocating the power lines, portions of the trail, and increasing environmental impacts compared to other available alternatives evaluated in the EIS.
Rebuild Northgate Park-and-Ride in the manner of Hammersmith Station in London with better connections, mixed uses, and amenities.	The Northgate Station is part of the Northgate Link Extension project, which has completed its environmental review process and is now under construction. The Northgate Station is not part of the Lynnwood Link Extension.
Consider staggered stops, run more trains but skip some stations.	Lynnwood Link is an extension of a 2-track line from Northgate that passes through the Downtown Seattle Transit Tunnel. The tunnel must accommodate operations of the light rail network that will extend from Federal Way on the south, Redmond on the east, and Lynnwood on the north. While a skip stop operation between Northgate and Lynnwood might reduce travel times in this section by 90 to 120 seconds, it would significantly increase capital costs and right-of-way needs. In addition, more frequent train service would also tax operations through the Downtown Seattle Transit Tunnel.
Consider a mix of express bus on I-5 between Lynnwood and Northgate, in combination with a limited stop light rail route using SR 99 to connect Lynnwood to Northgate.	An SR 99 alignment as well as the use of express bus or Bus Rapid Transit as modes were removed because they would not provide the levels of speed, reliability, and capacity needed to make effective regional corrections as envisioned in Sound Transit's Long-Range Plan.

- **Maximize the Advantages in Existing Transit Infrastructure in Potential Station Sites**. Siting stations at or near existing transit facilities makes efficient use of existing investments and optimizes connections between light rail and local bus services. Light rail stations need a section of straight and level track to hold four-car trains, which are 380 feet long. Station sites also need to be accessible, and ideally would provide opportunities for transit-oriented development.

- **Maximize the Advantages of Existing Transportation Rights-of-Way.** A light rail route along I-5 provides certain environmental and cost advantages over routes in entirely new rights-of-way. Sound Transit and WSDOT collaborated to identify where Sound Transit could reasonably anticipate using I-5 ROW for light rail without impacting WSDOT's ability to make future highway improvements, and without significant safety, maintenance, or operational impacts, consistent with FHWA regulations. They considered highway and light rail design standards, as well as safety and operation and maintenance needs for the highway. These efforts produced the *I-5 Light Rail Compatibility Report* (Sound Transit 2012) (attached as

Appendix Q to this Final EIS), which is the basis for the conceptual engineering of the Draft EIS alternatives and their assumptions about using WSDOT's right-of-way. Ultimately, FHWA must approve the project's use of the I-5 right-of-way.

In each of the three project segments, the range of alternatives Sound Transit considered reflects the above factors. In Segment A, for instance, all the alternatives evaluated in this EIS are on the east side. This is partly because the I-5 right-of-way is very limited on the west side in Segment A, and Sound Transit found more areas on the east side where rights-of-way for I-5 and local streets could be combined to accommodate light rail. This helped reduce comparative environmental impacts. In addition, the existing Northgate Transit Center requires the project to start on the east side of I-5, and there were more potential station sites with existing infrastructure, access, and available rights-of-way on the east side from Northgate up to nearly NE 175th Street.

Also, the west side has more parks that could be affected, such as Northacres Park, Twin Ponds Park, and Ronald Bog Park. Several of these parks contain streams and wetlands, and Thornton Creek also runs adjacent to I-5 between NE 145th Street and NE 163rd Street.

Overall, alignments on the east side of I-5 have more advantages and would have fewer impacts than west side alignments or east-west crossings. Potential west side or east-west crossing alternatives would result in higher costs, environmental impacts, and operating concerns.

During the alternatives development, Sound Transit again applied its design standards and reviewed operating, impact, and cost factors to develop and refine alternatives. For example, Segment A at NE 155th Street, Sound Transit modified the siting of a parking garage for Alternatives A5 and A7 to avoid affecting a historic home. In Segment B, it modified Alternatives B2 and B2A on the west side of I-5 to avoid affecting a historic school.

In Segment C, Sound Transit considered a variety of station and alignment concepts before defining the Segment C alternatives in this EIS. These concepts included alternatives that bisected more of the Scriber Creek wetland area, crossed nearer to Scriber Creek Park, occupied more area of the Edmonds School District site, or placed stations and tail tracks in areas requiring more properties. Sound Transit also reviewed the estimated costs, effectiveness, and impacts with cooperating agencies, including the City of Lynnwood, for all alternatives.

2.6.2 Developing Details of the Alternatives

After the Alternatives Analysis, Sound Transit defined a more detailed range of potential alignment and profile alternatives along the I-5 corridor. The Alternatives Analysis examined only a representative I-5 alternative and route that featured four stations. Sound Transit explored a variety of station and alignment design and siting choices along the I-5 corridor from Northgate to Lynnwood. The concepts reflected public and agency comments and suggestions made during the environmental scoping comment period. Sound Transit also developed alignment, profile, and station siting concepts by working with local jurisdictions and WSDOT.

After developing several I-5 alternative concepts, Sound Transit evaluated how well these various concepts addressed the project's purpose and need and how they affected constructability, impacts, and costs (the same factors considered during the Alternatives Analysis). Other evaluation criteria considered consistency with the approved ST2 program, station access needs, development constraints, Sound Transit policies, and design guidance.

Definition of EIS Alternatives by Geographic Segment

From the I-5 corridor alternative concepts, Sound Transit developed a range of potential Draft EIS alternatives in three segments from Northgate to Lynnwood, and presented them in a draft Sound Transit Board Briefing Book in March 2012. The Sound Transit Board members suggested other alternatives and variations, and Sound Transit completed a Final Board Briefing Book in April 2012 (included in Appendix K, Supporting Documents). The Briefing Books, which were publicly available, evaluated each alternative under consideration.

After reviewing the Briefing Book and public comments, the Sound Transit Board passed Motion M2012-17 regarding the alignment and station alternatives to be considered in the Draft EIS. It removed a number of the potential alternatives from further consideration based on their higher impacts, costs, and/or lower benefits when compared to other alternatives (see Figure 2-11). The Board added a few alternatives that offered different pairings of alignments and stations for consideration. The alternatives identified in Motion M2012-17 were analyzed in the Draft EIS.

After the publication of the Draft EIS and the close of the public comment period, the Sound Transit Board considered the Draft EIS information, public comments received, and supporting briefing materials. With Motion M2013-96, the Board identified a Preferred Alternative for evaluation in the Final EIS and requested that staff consider options and modifications to the Preferred Alternative and other alternatives. Section 2.4 describes the resulting range of light rail alternatives.

Draft EIS Public and Agency Comments Suggesting New or Modified EIS Alternatives

Before preparing the Final EIS, Sound Transit reviewed comments on the Draft EIS that suggested modifying the alternatives or adding other alternatives. Many of these comments focused on station area elements and features, particularly measures that would improve multimodal access. The conceptual design plans for the Preferred Alternative reflect some of these suggestions, and might be integrated during final design.

Other comments suggested moving the alignments to the west side of I-5 in Segment A, which was already considered in earlier planning but not advanced due to environmental, design, and station siting constraints, as described in Section 2.6.1. Other comments suggested lids or tunnels to allow light rail to run under or above I-5, which was not considered further due to high construction impacts to I-5. A number of comments suggested designing the stations to specifically accommodate transit-oriented development, including developments above the stations; in station locations outside the I-5 right-of-way, such opportunities to accommodate other developments would remain available to the project, but would require partnerships with developers before more specific designs would be developed. A few parties suggested widening roadways such as NE 145th Street or at 200th Street SW. The project includes specific intersection improvements; however, its traffic impacts do not warrant major widenings. Other suggestions, such as a median station at 220th Street SW, a modified station at NE 155th Street, or a station at NE 175th Street, had been previously considered but were not advanced because other alternatives with lower impacts and higher benefits were available.

In Segment C, the City of Lynnwood suggested a "C3 Modified," which Sound Transit and the City collaborated to refine, resulting in what is now the Segment C Preferred Alternative. The Pilchuck Audubon Society suggested Sound Transit extend the route farther along I-5 before shifting to the Lynnwood Transit Center or Alderwood Mall to avoid impacts on Scriber Creek Park and the adjacent stream and wetland complex. This suggestion was not incorporated because of conflicts with existing freeway direct access ramps and related design and engineering challenges.

More details on specific comments and Sound Transit's responses are provided in Appendix P, Draft EIS Public Comments and Responses.

2.7 Environmental Practices and Commitments

As an agency that has built and operated light rail, commuter rail, and regional express bus service in multiple Puget Sound communities, Sound Transit has established programs, best practices, and policies that are incorporated as part of the Lynnwood Link Extension. These include the agency's sustainability and environmental management programs (as outlined in Sound Transit's Sustainability Plan), along with

Sound Transit's design standards for light rail, its commitment to work collaboratively with other jurisdictions, and its commitment to obtain and comply with all required permits and approvals needed for construction and operation.

2.8 Estimated Project Costs

With seven alternatives in Segment A, four in Segment B, four in Segment C, and options for many alternatives, there are many possible segment combinations that could create the full 8.5-mile light rail extension from Northgate to Lynnwood. The Preferred Alternative's estimated capital costs are $1.5 billion to $1.7 billion. The other possible combinations have total capital costs that range between $1.4 billion and $2.0 billion. The Preferred Alternative is estimated to cost about $16 million (2014$) per year to operate and maintain. Other alternatives would be similar. Chapter 5, Evaluation of Alternatives, has information on estimated project costs by alternative.

2.9 Other Project Area Activities

The Lynnwood Link Extension is being proposed in an area with vibrant, established urban communities. These communities, and the transportation systems that serve them and the region, will continue to change to accommodate additional people and jobs through 2040.

There are no other major transportation projects that would span the full project corridor. However, at the southern end of the project corridor, Sound Transit will open the Northgate Link Extension, with a new light rail station and parking garage, in 2021. Sound Transit is also conducting planning and environmental review for a separate project, the Link Operations and Maintenance Satellite Facility, which includes an alternative in the project corridor (see Section 2.9.1 below). In addition, future tolling along I-5 is possible, and some local transportation projects will be developed nearby.

All of the area jurisdictions have adopted plans that anticipate increased development in the corridor, and some landowners are considering redevelopment actions. Appendix H, Other Projects and Actions Considered in Cumulative Effects, lists the projects considered in the cumulative effects analysis. Chapter 3, Transportation Impacts and Mitigation, and Chapter 4, Environmental Impacts and Mitigation, consider the cumulative effects of the Lynnwood Link Extension in conjunction with these and other plans and projects.

2.9.1 Link Operations and Maintenance Satellite Facility

Sound Transit plans to construct and operate a Link Operations and Maintenance Satellite Facility (OMSF) to support light rail operations and maintenance needs for the ST2 program of projects across the Sound Transit district. Sound Transit and FTA issued a separate NEPA/SEPA Draft EIS for this facility in May 2014 and are

now preparing its Final EIS. The new OMSF would operate in conjunction with Sound Transit's existing Forest Street Operations and Maintenance Facility (OMF) in Seattle to support the 80 additional light rail vehicles required for ST2's expanded system. The Forest Street OMF would continue to provide inspection, heavy repair, and overhaul services, while the OMSF would store, maintain, and dispatch vehicles for daily service.

This Lynnwood Link Extension EIS analysis assumes the OMSF along with other ST2 projects, as part of the No Build and all build alternatives. The OMSF is expected to be operating by 2021, before the Lynnwood Link Extension is complete. Even if the Lynnwood Link Extension does not go forward, Sound Transit will construct the OMSF to accommodate other elements of the ST2 Plan. Therefore, the OMSF is related to the Lynnwood Link Extension but it has independent utility under NEPA and SEPA.

Similarly, Sound Transit does not require the OMSF in order to build and operate the Lynnwood Link Extension, although it needs the OMSF to operate at the level of light rail service assumed for the ST2 program. If the OMSF is delayed or not constructed, Link operation and maintenance would occur exclusively at the Forest Street OMF. Thus, the Lynnwood Link Extension has independent utility from the OMSF project. However, Lynnwood Link Extension service levels without the OMSF would be substantially lower than with it. During peak periods, the OMSF would enable four-car trains at 4-minute headways between the Lynnwood Transit Center and International District Station in Seattle. Without the OMSF, the Lynnwood Link Extension would run three-car trains and have longer peak-hour headways.

Lower service levels and reduced capacity could result in overcrowding on trains and platforms and reduced ridership for the Lynnwood Link Extension. However, even with lower ridership, the Lynnwood Link Extension project's impacts would not be notably different than described elsewhere in this EIS. Lower ridership could, however, make the project less competitive for federal Capital Investment Program funding, and would prevent it from realizing its full potential benefits. Appendix R, Link Operations and Maintenance Satellite Facility Analysis, summarizes the potential change in impacts with lower service levels compared to those with the OMSF as assumed in the No Build and light rail alternatives evaluated in this EIS.

The OMSF would require 20 to 25 acres of land to serve the complete ST2 light rail system. The location must be adjacent to an operating line in the north or the east to provide efficient and reliable system-wide service. The OMSF Draft EIS (May 2014) evaluated one alternative in Lynnwood (Figure 2-12) and three alternatives in Bellevue: (see Figure R-1 in Appendix R).

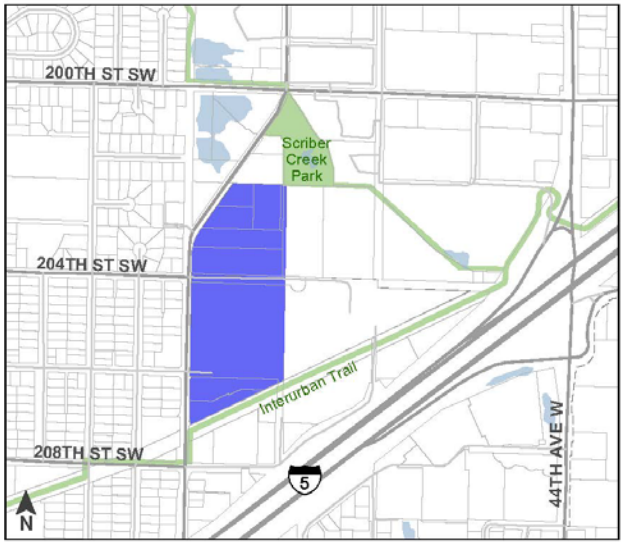

Figure 2-12
Location of Lynnwood Alternative in Sound Transit's Link Operations and Maintenance Satellite Facility EIS

The Lynnwood Alternative is north of I-5, west of the Lynnwood Transit Center, and east of 52nd Avenue West/Cedar Valley Road. It has design options that would match the configuration of any of the Lynnwood Link Extension light rail alternatives. To provide morning service to the Eastside, this alternative would be paired with a small Bellevue facility called the BNSF Storage Tracks with additional light rail vehicle storage, operator report facilities, and interior cleaning functions for up to 32 vehicles. This would be north of NE 12th Street and south of SR 520 within the Sound Transit-owned portion of the Eastside Rail Corridor and on an adjacent property to the east. The three alternatives in Bellevue, the BNSF Alternative, the BNSF Modified Alternative, and the SR 520 Alternative, are described in Appendix R and shown in Figure R-1 of that appendix.

On July 24, 2014, the Sound Transit Board identified the BNSF Alternative as the Preferred Alternative for evaluation in the OMSF Final EIS along with other alternatives (Motion M2014-51). A final decision on the OMSF site will be made after publication of the project's Final EIS, expected in summer 2015.

Because these two projects have independent utility, this Lynnwood Link Extension EIS describes and summarizes where the impacts of the OMSF alternatives worsen or change the impacts of the Lynnwood Link Extension, just as the EIS analyzes the project's potential impacts in combination with those of other reasonably foreseeable projects in the vicinity. The analysis of potential cumulative impacts of the Lynnwood Link Extension and the OMSF project is based on the OMSF Draft EIS and the Lynnwood Link Extension Final EIS. Appendix R summarizes the potential impacts of all the OMSF alternatives described in the OMSF Draft EIS; that Draft EIS can be found on Sound Transit's website (http://www.soundtransit.org/Projects-and-Plans/Link-Operations-and-Maintenance-Satellite-Facility).

2.10 Key Steps for this Project and the EIS

From September 24 through October 27, 2010, Sound Transit and FTA conducted an early scoping process for an Alternatives Analysis for the project; three public meetings were held to provide project information to the public. Early scoping is an optional step in the state and federal environmental review process and is meant to engage the public, agencies, and other stakeholders in the alternatives analysis process, which occurs before defining the alternatives evaluated in the EIS.

A year later, with completion of an *Alternatives Analysis Report and SEPA Addendum* (Sound Transit 2011a), FTA issued the Notice of Intent to prepare an EIS, after which Sound Transit and FTA conducted the environmental scoping process for the EIS from September 30 through October 31, 2011. Environmental scoping is required under SEPA and NEPA and allows the public, agencies, and tribes an opportunity to provide comments on the proposed project alternatives, Purpose and Need Statement, and potential environmental impacts. The comments received during environmental scoping helped Sound Transit and FTA refine the Purpose and Need Statement, define the scope of analysis for this EIS, and identify potential significant impacts resulting from the proposed project. Chapter 6, Public Involvement, provides additional details about the environmental scoping process and outreach for the project to date.

The Draft EIS was released on July 26, 2013, with a 60-day comment period. After considering the analysis in the Draft EIS and the public and agency comments, the Sound Transit Board identified a Preferred Alternative (Motion M2013-96) for evaluation in the Final EIS along with other alternatives. Chapter 6, Public and Agency Involvement, has further details on the Draft EIS public meetings and hearings, as well as other public involvement activities since the publication of the Draft EIS. Chapter 7, Draft EIS Comments and Responses, summarizes the public comments Sound Transit and FTA received, and Appendix P, Draft EIS Public Comments and Responses, provides the detailed comments and responses.

2.11 Next Steps

The Sound Transit Board will consider the analysis in the Final EIS, including public and agency comments and responses, and will then select the project alternative to be built. After the Board's decision, FTA also is expected to publish its Record of Decision (ROD) for the project, which will document findings by FTA that the project has met the requirements of NEPA and related environmental regulations. It will describe FTA's decision on the project, alternatives considered, the basis for the decision to approve the project, and mitigation measures required as conditions of FTA approval.

FTA is directed to issue a combined Final EIS and ROD document pursuant to Public Law 112-141, 126 Stat. 405, Section 1319(b) unless it determines, for statutory criteria or practicability reasons, that separate EIS and ROD documents are appropriate. A

joint Final EIS/ROD is not required when a Draft EIS does not identify a Preferred Alternative, which was the case with the Lynnwood Link Extension Draft EIS. The Lynnwood Link Extension EIS is a joint NEPA and SEPA document consistent with 40 CFR 1506.2(c) and it supports decision-making by Sound Transit, FTA, and other agencies, but the timing of their decisions varies. For example, SEPA requires that the Sound Transit Board's final decision on the project to be built be informed by the Final EIS, and a final decision cannot be made until the Final EIS has been issued. The FTA ROD is required to describe the final project decisions and therefore must be issued after the Sound Transit Board's final decisions on the project. FTA has thus determined it is not practical to issue a combined Final EIS and ROD; these documents are being published separately.

After the Sound Transit Board selects the project to be built and FTA issues a ROD, Sound Transit will initiate final design, begin property acquisition, conduct construction planning, and apply for the other permits and approvals needed to construct and operate the project. This includes the FHWA approvals needed to construct and operate the light rail project within the interstate right-of-way. FHWA is expected to issue its own ROD for the project and can use this Final EIS to help meet other applicable decision requirements. Similarly, the local jurisdictions issuing permits for the project may rely on the Final EIS to help satisfy their SEPA requirements. Final design and permitting is scheduled for 2015 to 2018. Construction of the project is expected to start in 2018 and end in 2023, with service starting in late 2023.

3 TRANSPORTATION IMPACTS AND MITIGATION

This chapter summarizes the characteristics of the transportation system in the Lynnwood Link Extension study area and describes potential impacts and mitigation associated with the project alternatives.

The analysis of the transportation system considers the following transportation elements:

- Regional context and travel patterns
- Transit service and operations
- Freeway operations
- Arterial and local street operations
- Nonmotorized facilities
- Freight mobility and access
- Parking
- Safety

This chapter describes the existing transportation environment for each transportation element, and then presents the analysis results showing potential impacts and mitigation. A more detailed discussion of the transportation analysis and results is in the *Transportation Technical Report*.

3.1 Affected Environment

3.1.1 Regional Context and Travel Patterns

Transportation Facilities

The project area is served by a network of roadways consisting of a major interstate route (I-5), state highways (SR 99, SR 523, and SR 104), and other local arterials and roads. Figure 3-1 shows the street and highway network in the Lynnwood Link Extension study area, as well as the screenline volume-to-capacity (v/c) ratios during peak hours at selected locations (described below under Travel Demand and Patterns). Higher v/c ratios generally indicate more congested traffic conditions.

The primary north-south freeway serving the project area is I-5, which provides regional and interstate movement and access to the project corridor's local communities. I-5 also serves regional express bus service in the corridor, and the freeway is at or near capacity during many hours of the day. SR 99 (Aurora Avenue North), SR 523 (also known as North/NE 145th Street), SR 522, and SR 104 are other state highways located within the project area that provide access to bus transit, passenger rail, ferries, and the movement of freight through the area. More information on transportation facilities is provided in the *Transportation Technical Report*.

Screenlines

$$\text{Volume-to-Capacity (V/C) Ratio} = \frac{\text{Total Peak Hour Traffic Volume}}{\text{Available Peak Hour Roadway Capacity}}$$

Figure 3-1
Existing Peak Hour Volume-to-Capacity (V/C) Ratios at Screenline Locations

Several of the north-south arterials that connect neighborhoods and commercial districts in the project area include Greenwood Avenue North, Westminster Way North, Aurora Avenue North (SR 99), Meridian Avenue North, 5th Avenue NE, 15th Avenue NE, SR 522, 52nd Avenue West, and segments of Roosevelt Way North. Some of the major east-west trips are served by NE 130th Street, NE 145th Street, and NE 175th Street—all of which access I-5 with interchanges where congestion occurs regularly. North 117th Street, NE 155th Street, and NE 185th Street cross I-5 and connect business districts on each side. Within Lynnwood, 200th Street SW provides an arterial connection between SR 99 and the Lynnwood Transit Center.

Travel Demand and Patterns

Miles Driven and Hours Spent in Travel

Table 3-1 shows the vehicle miles traveled (VMT) and vehicle hours of travel (VHT) for the Puget Sound region as modeled with the Sound Transit Highway Model[1].

Table 3-1. Daily Vehicle Miles of Travel (VMT) and Vehicle Hours of Travel (VHT) in the Puget Sound Region for Base Year 2011

Alternative	VMT	VHT
Base Year (2011)	79,440,000	2,210,000

Source: Sound Transit Highway Model.

Vehicles Traveling through the Corridor

To help measure regional traffic conditions, Sound Transit set several screenlines in the study area and calculated traffic volumes and v/c ratios on the combined group of north-south freeways and arterials in the corridor. A v/c ratio above 0.90 (or 90 percent of capacity) typically represents congested conditions. A v/c ratio of 1.0 indicates that a corridor is operating at capacity and represents highly congested conditions. Figure 3-1 shows the screenline locations and results.

A "screenline" is an imaginary line across a section of freeway and/or arterials. Screenlines are often used in traffic analyses to determine how much volume is entering or exiting a particular area based on how much traffic crosses the screenline.

The corridor's peak period traffic follows typical commute patterns. These commuter trips are heavily oriented southward toward jobs in Seattle in the morning peak period and northward back to the cities with large residential bases in the evenings.

During the AM peak hour, the screenlines show the project corridor, including I-5 and north-south arterials, exceeds 90 percent of capacity in

[1] Sound Transit Highway Model is based on PSRC Regional Model: WSDOT Project Version.

the peak southbound direction and is consistently congested. Traffic in the reverse direction in the morning is much lighter.

For the PM peak hour traveling northbound, the screenlines again show traffic volumes at up to 98 percent, which is nearly at capacity, reflecting highly congested conditions. The reverse peak direction in the evening is lighter but has high volumes as well, particularly on I-5.

Additional discussions regarding travel patterns across these north-south screenlines and an east-west screenline are provided in the *Transportation Technical Report*.

People Traveling through the Corridor

Table 3-2 shows the number of persons traveling through the corridor during the PM peak period at two screenline locations in Base Year 2011. The person throughput includes trips on I-5, SR 99, and other north-south arterials via automobile and transit.

Table 3-2. Person Throughput—PM Peak Period for Base Year 2011

Screenline Location	Alternative	Northbound	Southbound	Total
North of NE Northgate Way	Transit	11,000	2,000	13,000
	Automobile	62,000	40,000	102,000
	Total	73,000	42,000	115,000
South of North 205th Street	Transit	7,000	1,000	8,000
	Automobile	49,000	32,000	81,000
	Total	56,000	33,000	89,000

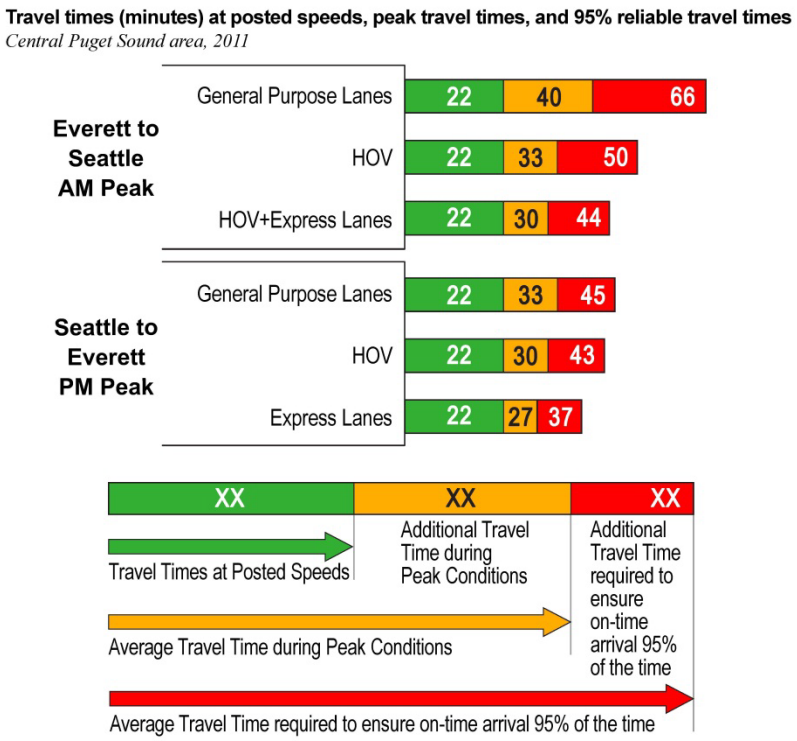
Source: Sound Transit Highway Model.

I-5 Congestion

I-5 is the most heavily traveled highway in the state, carrying from 159,000 to 196,000 vehicles on an average day in the project corridor. As a result of the high volume of travel and limited capacity in the project corridor, peak period traffic is consistently congested and travel times are unreliable.

WSDOT's time reliability calculator (Figure 3-2) illustrates that a peak period trip between Everett and Seattle at free-flow speeds should take about 22 minutes on I-5 (WSDOT 2012), but currently it takes much longer to make the trip during peak travel periods. For example, in the morning peak period a driver must typically allow 66 minutes for the southbound trip; however, a vehicle trip in the HOV lane is calculated at 50 minutes—a saving of 16 minutes.

Reverse commutes are unreliable as well because of bottleneck locations at several points in the corridor where reversible lanes, HOV lanes, and interchanges create regular backups, particularly from NE 145th Street south to Northgate and toward downtown Seattle.



Source: The 2012 Congestion Report (WSDOT 2012).

Figure 3-2. Travel-Time Reliability for the Everett-to-Seattle Commute

Unreliable travel on I-5 HOV lanes in the peak direction during the peak period affects transit because that is when most transit service occurs. The WSDOT-adopted HOV lane policy calls for HOV lanes to maintain an average speed of 45 mph or greater at least 90 percent of the time during the peak hour for both the morning and afternoon. The I-5 HOV lanes in the project corridor do not currently meet this performance standard. In addition to the peak direction, buses traveling in the non-peak direction (e.g., southbound during the PM peak period) must travel in general purpose lanes from Northgate to downtown Seattle because the reversible express lanes operate in the peak direction only. Thus, these bus trips are subject to general purpose traffic congestion for that portion of the trip.

HOV lane performance is also affected by the operation of the adjacent general purpose lanes. Travel in the HOV lane is often slowed when there is nearby slow traffic in the general purpose lane (i.e., "lane friction") due to the limited physical separation between the HOV lane and general purpose lanes, as well as non-standard lane widths and limited shoulder width to the left of the HOV lane. Drivers in the HOV lane are often reluctant to travel at faster speeds than vehicles in the next lane, and the different speeds make it difficult to move in and out of the HOV lane.

In addition to high traffic volumes and congestion on I-5, the high frequency of collisions contributes to unreliable travel. Along the approximately 10-mile section of I-5 in the project area (Northgate to Lynnwood, milepost [MP] 172 to 182), over 80 percent of the collisions were rear-end or sideswipe collisions, and about 60 percent of the collisions occurred during the peak travel periods.

PSRC's *Transportation 2040* and the *Washington Transportation Plan* do not include major expansions of highway capacity in the corridor. This is, in part, because there is little room to expand the existing roadway without high capital, societal, and environmental costs and impacts in comparison to the mobility benefits it would provide. Regional transportation planners expect the current high levels of travel demand to continue growing, and congestion and unreliability for travelers on I-5 will increase through 2040 (PSRC 2010b).

3.1.2 Transit

Regional Transit

This subsection describes existing transit service in terms of service characteristics, ridership, and transit travel times. More detail is provided in the *Transportation Technical Report*.

Service Characteristics

Transit services within the study area are provided by Community Transit, King County Metro, and Sound Transit. Bus routes along I-5, operated by Sound Transit, Community Transit, and King County Metro, provide long-distance service between major transit centers in the study area and major urban centers in the region. Sound Transit's ST Express service provides two-direction, all-day service between major regional destinations. Community Transit and King County Metro services along I-5 in the study area are primarily peak-direction, peak-period service, which is oriented to commuters. Swift, Community Transit's bus rapid transit service, operates along the Snohomish County portion of the SR 99 corridor. King County Metro's RapidRide E Line began service on Aurora Avenue North in February 2014. The frequency and number of bus routes in service increase during the peak periods, primarily in the peak direction of travel. These routes connect park-and-rides and transit centers in Snohomish and north King counties with major employment centers in the city of Seattle.

In the Lynnwood Link Extension study area, there are three transit centers with park-and-ride facilities, and two additional locations with smaller park-and-ride lots. These facilities are listed in Table 3-3.

Table 3-3. Existing Transit Center and Park-and-Ride Facilities in the Lynnwood Link Extension Study Area

Transit Facility	Type of Facility	Park-and-Ride Stalls
Northgate Transit Center (includes adjacent facilities at Northgate Mall and Thornton Place)	Transit Center, Park-and-Ride	1,523
5th Avenue NE/NE 133rd Park-and-Ride (I-5 at NE 130th Street)	Park-and-Ride	46
North Jackson Park Park-and-Ride (I-5 at NE 145th Street)	Park-and-Ride	68
Mountlake Terrace Transit Center (I-5 at 236th Street SW)	Transit Center, Park-and-Ride	880
Lynnwood Transit Center	Transit Center, Park-and-Ride	1,370

Note: Transit routes and park-and-ride stalls listed as of summer 2012. Stall capacities do not include accessible spaces or spaces reserved for other uses.

Sources: http://www.communitytransit.org/parking/; http://metro.kingcounty.gov/tops/parknride/pr-north-seattle.html; http://www.soundtransit.org/Rider-Guide/Parking-facilities

The Northgate Transit Center is accessed by general purpose ramps to and from the I-5 mainline, express lanes (to and from the south only), and arterials. Freeway flyer stops at NE 145th Street (northbound and southbound) are accessed from the outside general purpose lanes. Regional transit serving the NE 145th Street flyer stops must leave the inside HOV lane, weave through congested general purpose lanes to exit to the flyer stops, re-enter I-5, then weave again to re-enter the inside HOV lane. Regional transit currently accesses the Mountlake Terrace Transit Center using an in-line freeway station accessed directly from the HOV lanes. Regional transit serves the Lynnwood Transit Center via a direct access ramp to/from the HOV lanes.

These transit centers and park-and-ride facilities connect adjacent neighborhoods with transit service traveling along I-5 and regional arterials. These transit routes provide service to a variety of destinations, including downtown Seattle, University District, Northgate Transit Center, Aurora Village, and Mountlake Terrace Transit Center.

Ridership

Table 3-4 shows the daily bus ridership for regional bus routes on I-5 north of Northgate along with various locations on other key transit corridors in the region. Ridership on I-5 at the Ship Canal Bridge includes riders from north of Northgate, in addition to those boarding farther south between Northgate and the Ship Canal. This information shows that the project corridor currently carries the second highest bus ridership volumes in the region.

Table 3-4. Daily Bus Ridership on Select Regional Corridors—Base Year (2011)

	Bus Ridership
I-5, North of NE Northgate Way	19,400
I-5, Ship Canal Bridge	33,400
I-5, South of West Seattle Bridge	16,400
I-5, South of I-405	9,200
SR 520, Midspan	16,000
I-90, Between Seattle and Mercer Island	11,600
I-90, East of 148th/150th Avenue SE Interchange	4,000
I-405, North of SR 520	4,400
I-405, South of SR 520	4,000

Source: Sound Transit Ridership Forecasting Model.

Transit Travel Times

Table 3-5 shows scheduled transit travel times during the peak period between Shoreline (I-5 at NE 145th Street) and Lynnwood (Lynnwood Transit Center) and other regional destinations. Longer transit travel times reflect congestion as well as the need to transfer between routes to reach some destinations. The longest trips are northbound in the evening. The greater evening congestion in the I-5 general purpose and HOV lanes causes lower speeds, more stop-and-go, and longer, less predictable travel times. In addition, the southbound transit trips are slower in the PM peak period for some origin/destination pairs due to congestion and because the I-5 express lanes are operating northbound. More detailed information on transit travel times is provided in the *Transportation Technical Report*.

Table 3-5. Peak Period Transit Travel Times (minutes)

	Southbound – AM Peak		Northbound – PM Peak		Southbound – PM Peak	
Destination/Origin	From Shoreline	From Lynnwood	To Shoreline	To Lynnwood	From Shoreline	From Lynnwood
Northgate	16	52[a]	7	70[a]	17	55[a]
University of Washington	25	37	30	32	47	39
Capitol Hill	30	48	62	60	40	66
Downtown Seattle	18	36	22	41	23	35
Sea-Tac Airport	66	79	75	93	66	79

Note: These transit travel times reflect the existing conditions on existing bus routes and, in many cases, include estimated transfer times where direct services is not available. In addition to these travel times, the total transit travel time would include the time to access the bus as a pedestrian, bicyclist, passenger, or driver, along with the wait time for a bus. The wait time for a bus would be dependent on the service reliability (adherence to schedule). If a bus arrival is unreliable, then the riders must arrive prior to the scheduled time and wait until the bus arrives on time or late.

[a] Because the Northgate to Lynnwood route does not have direct service, travel times are longer than comparable trips.

Source: King County Metro Trip Planner, http://metro.kingcounty.gov/.

Transit Level of Service

Sound Transit evaluated the quality of transit service at major transit destinations and activity centers, including the proposed light rail stations for the project alternatives. The *Transportation Technical Report* quantitatively evaluates transit service in more detail. The quality of transit level of service (LOS) was analyzed for the following types of performance measures:

- Service frequency
- Hours of service
- Passenger load (passenger crowding)
- Reliability of service (on-time performance and headway adherence)

Similar to how LOS is typically measured for highway or arterial performance, transit LOS is measured using the letter grades A through F, with LOS A denoting the best performance and LOS F generally considered failing performance. One or more transit providers have direct transit service to the major urban centers in the region, with LOS ranging from A to D, but some proposed Lynnwood Link Extension station areas do not have direct bus service to or from other destinations or urban centers. If no direct bus service was provided between two destinations, LOS was not calculated. Service hours also vary; many destinations with direct transit service provide hours of service at LOS A or B, while others are at LOS E or F. Passenger load LOS in the project corridor ranges from LOS A to B, with the highest passenger loads southbound in the AM peak period and northbound in the PM peak period. When buses are more crowded, they have longer delays at stops and have less reliable travel times. The reliability of service on Sound Transit routes in the project corridor ranges from LOS B to C. Along I-5, buses may get caught in reverse-peak (i.e., southbound) congestion in the afternoon hours, delaying the start of peak direction trips. While the majority of the regional bus routes operate on time, some experience lower reliability and can be late 15 percent of the time or more.

Local and Sub-regional Transit

King County Metro and Community Transit currently provide local and sub-regional transit services in the project area. In addition to the sub-regional services provided by Community Transit's Swift and King County Metro's RapidRide, local buses provide service to several transit centers, park-and-ride facilities, neighborhoods, and activity centers throughout the project area. While local bus routes provide frequent stops (e.g., every two blocks), sub-regional bus routes may have longer distances (such as 0.5 mile) between stops. In addition, dial-a-ride services are offered in many parts of the project area. More details on local and sub-regional bus service are provided by project segment in the *Transportation Technical Report*.

3.1.3 Freeway Operations

Freeway operations were evaluated using traffic simulation software along I-5 between Northgate Way and the 196th Street SW interchange in Lynnwood. The traffic simulation model included the I-5 freeway mainline and all ramps along this segment of I-5. In addition to modeling the freeway and ramps, the ramp terminal intersections and adjacent arterial intersections were analyzed at key interchanges to capture the interaction between freeway and arterial traffic operations, including queuing activity and spill-back effects (queuing from a congested location that extends and affects operations at the next interchange or intersection). The ramp and arterial intersections were modeled at interchanges such as the NE 130th Street, NE 145th Street, 220th Street SW, 44th Avenue West, and 196th Street SW interchanges. The analysis considered travel times, mainline speeds, vehicle throughput, and LOS. Section 4.3.3 of the *Transportation Technical Report* provides more detail on I-5 freeway operations.

During the AM peak hour, average speeds along southbound I-5 within the traffic simulation area from Northgate to Lynnwood range from 24 mph approaching the NE 130th Street on-ramp to 58 mph in Lynnwood. Congested conditions are caused by high volumes of merging traffic at NE 130th Street, NE 145th Street, NE 175th Street, and SR 104, as well as heavy merging and weaving maneuvers south of the project area. In the northbound direction, I-5 is generally uncongested, with an average speed of approximately 55 mph.

During the PM peak hour, average northbound I-5 peak period speeds within the traffic simulation area range from 18 mph between Northgate and the NE 130th Street off-ramp to 51 mph in Lynnwood. Northbound I-5 is operating under highly congested conditions with high volumes of merging, diverging, and weaving traffic at all of the study interchanges along the broader I-5 traffic simulation corridor. Field observations and model analysis results for southbound I-5 show speeds on I-5 ranging from 45 mph approaching the NE 145th Street off-ramp to 58 mph farther north approaching Lynnwood. In general, southbound I-5 is operating well, except for the area approaching NE 145th Street, where high southbound off-ramp volumes cause delays and queues that sometimes extend onto the freeway mainline. In areas south of the NE 130th Street interchange, at the Northgate interchange, and farther south, I-5 slows down in the PM peak hour, in part due to HOV-lane traffic entering the general purpose lanes (due to the express lanes operating northbound during this time frame). This segment of I-5 can often be congested from this location into downtown Seattle and continuing to the south. More details on I-5 freeway operations for the entire simulation area can be found in Section 4.3.3 of the *Transportation Technical Report*.

3.1.4 Arterials and Local Streets Traffic Operations

Arterial and local street traffic operations were analyzed using traffic simulation software based on the Transportation Research Board's *Highway Capacity Manual* methodology, which calculates peak hour LOS at signalized and unsignalized intersections, and calculates v/c ratios along arterials (TRB 2000). LOS ratings range from LOS A to LOS F; LOS A represents the best operation and LOS F the poorest operation. Arterial v/c ratios range from a low of 0.0 to a high of 1.0. A v/c ratio near 1.0 is considered a highly congested condition.

The arterial and local street traffic operations analysis covers locations most likely to be affected by the project alternatives, such as by a roadway change or signal control, or areas likely to be affected by trips to light rail stations. Figure 3-3 shows locations of the evaluated intersections; a complete list is in the *Transportation Technical Report*.

Intersections were analyzed to determine whether they are currently operating at acceptable levels or failing. Arterials within the Shoreline city limits were also analyzed to determine whether they meet City of Shoreline concurrency standards, which are intended to ensure that adequate transportation facilities will be in place as new developments occur. Intersections and arterials are considered failing when they do not operate at or better than the governing jurisdiction's performance standard. Table 3-6 summarizes the performance standards for the relevant jurisdiction. Sound Transit calculated LOS for existing traffic operations throughout the project corridor for the PM peak hour when traffic is highest. The agency also examined AM peak hour conditions for intersections with high volumes or intersections in critical locations, such as near a freeway interchange. Figure 3-4 shows the locations that currently do not meet LOS standards.

Segment A: Seattle to Shoreline

In Segment A, Sound Transit conducted PM peak hour analysis of 31 intersections in Seattle and 38 intersections in Shoreline. For the AM peak hour, Sound Transit conducted analysis at 15 intersections in Seattle and 11 intersections in Shoreline. The seven intersections listed below do not currently meet LOS standards during the AM and/or PM peak hour:

- 1st Avenue NE and I-5 ramps/Northgate Mall driveway (PM peak hour)
- 1st Avenue NE and NE Northgate Way (PM peak hour)
- 5th Avenue NE and I-5 northbound off-ramp south of NE 130th Street—eastbound approach (AM and PM peak hour)
- North 130th Street and Aurora Avenue North (PM peak hour)
- NE 145th Street and Bothell Way NE/Lake City Way NE (PM peak hour)
- NE 145th Street and 12th Avenue NE—northbound approach (PM peak hour)
- 5th Avenue NE and I-5 northbound off-ramp south of NE 145th Street—northbound approach (PM peak hour)

Table 3-6. Arterials and Local Street Performance Standards in the Project Corridor

Agency	Minimum Performance Standard
WSDOT	LOS D for Highways of Statewide Significance (HSS) LOS E/mitigated for regionally significant state highways (non-HSS)
City of Lynnwood	LOS E for city center arterials LOS D for non-city center arterials
City of Mountlake Terrace	LOS D for signalized intersections with the following exceptions (LOS E): • 212th Street SW • 244th Street SW • 220th Street SW between SR 99 and I-5 LOS E for unsignalized intersections
City of Shoreline	LOS D for signalized intersections LOS D for unsignalized intersecting arterials Volume-to-capacity ratio of 0.90 or lower for principal and minor arterials with the following exceptions: • 5th Avenue NE from NE 145th Street to the I-5 on-ramps; exempt from City concurrency standard • 15th Avenue NE from NE 150th Street to NE 175th Street; volume-to-capacity ratio of 1.10 or lower
City of Seattle	LOS D (goal)

In addition, the following arterial does not meet the City of Shoreline's concurrency standard of 0.90 or lower for principal and minor arterials during the PM peak hour:

- Meridian Avenue North from North 175th Street to North 185th Street—northbound

Segment B: Shoreline to Mountlake Terrace

In Segment B, Sound Transit conducted PM peak hour analysis of 19 intersections in Mountlake Terrace. For the AM peak hour, Sound Transit conducted analysis at six intersections. Only one, the 236th Street SW and 56th Avenue West intersection, operated below standard during the AM peak hour, but a local improvement is in place to improve conditions.

Segment C: Mountlake Terrace to Lynnwood

In Segment C, Sound Transit conducted PM peak hour analysis of 20 intersections in Lynnwood. AM peak hour analysis was also conducted at 10 intersections. All of these intersections currently meet LOS standards during the AM and PM peak hours.

3.1.5 Property Access and Local Circulation

The property access and local circulation analysis focused on streets, driveways, and connections most likely to be affected by the project alternatives. The evaluation of existing conditions includes descriptions of the physical characteristics of local street facilities near the proposed stations and along the proposed guideways in each segment. An inventory of the roadway characteristics is in the *Transportation Technical Report*.

3.1.6 Nonmotorized Facilities

The Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood have detailed inventories of their pedestrian and bicycle facilities, which Sound Transit used, along with field visits, to define existing facilities and conditions. A general depiction of regional multi-use trails and bicycle facilities is shown in Figure 3-5, based on geographic information system (GIS) database information from King County, Snohomish County, WSDOT, and Sound Transit. A detailed inventory of pedestrian and bicycle facilities near each proposed station is in the *Transportation Technical Report*.

Pedestrian Facilities

The inventory of pedestrian facilities includes arterials within a 0.5 mile radius of each proposed station.

Segment A: Seattle to Shoreline

In this segment, sidewalks or paths are along one or both sides of the street on most arterials within 0.5 mile of the proposed NE 130th Street, NE 145th Street, NE 155th Street, and NE 185th Street Stations. However, many sidewalks are substandard and do not meet the current ADA standards.

Segment B: Shoreline to Mountlake Terrace

In Segment B, sidewalks exist on one or both sides of nearly all arterials within the 0.5 mile radius of the Mountlake Terrace and 220th Street SW Station. There is a pedestrian and bicycle overcrossing of I-5 at NE 195th Street. There is also a 0.25-mile segment of paved multi-use trail along NE 195th Street between 1st Avenue NE and Meridian Avenue North. In addition, a soft-surface pedestrian trail connects the existing Mountlake Terrace Park-and-Ride to the City's library through the Veterans Memorial Park. The north-south Interurban Trail is within 1 mile of the Mountlake Terrace Transit Center as well as the 220th Street SW Station area.

Segment C: Mountlake Terrace to Lynnwood

In Segment C, there are sidewalks on all of the streets in downtown Lynnwood and in the vicinity of the station alternatives. The Interurban Trail passes through Lynnwood, generally following the Snohomish County Public Utility District (PUD) power line right-of-way. A segment of this trail is on-street for a short segment on 52nd Avenue West, then along 208th Street SW between 54th Avenue West and 52nd Avenue West, and along a short segment of 52nd Avenue West between 208th Street SW and the power line corridor just north of 208th Street SW. The City of Lynnwood is currently in the predesign phase of a project to complete this missing link in the off-street trail. From 52nd Avenue West, the trail rejoins the power line corridor, then crosses over 44th Avenue SW on a pedestrian/bicycle bridge and continues adjacent to the west side of I-5.

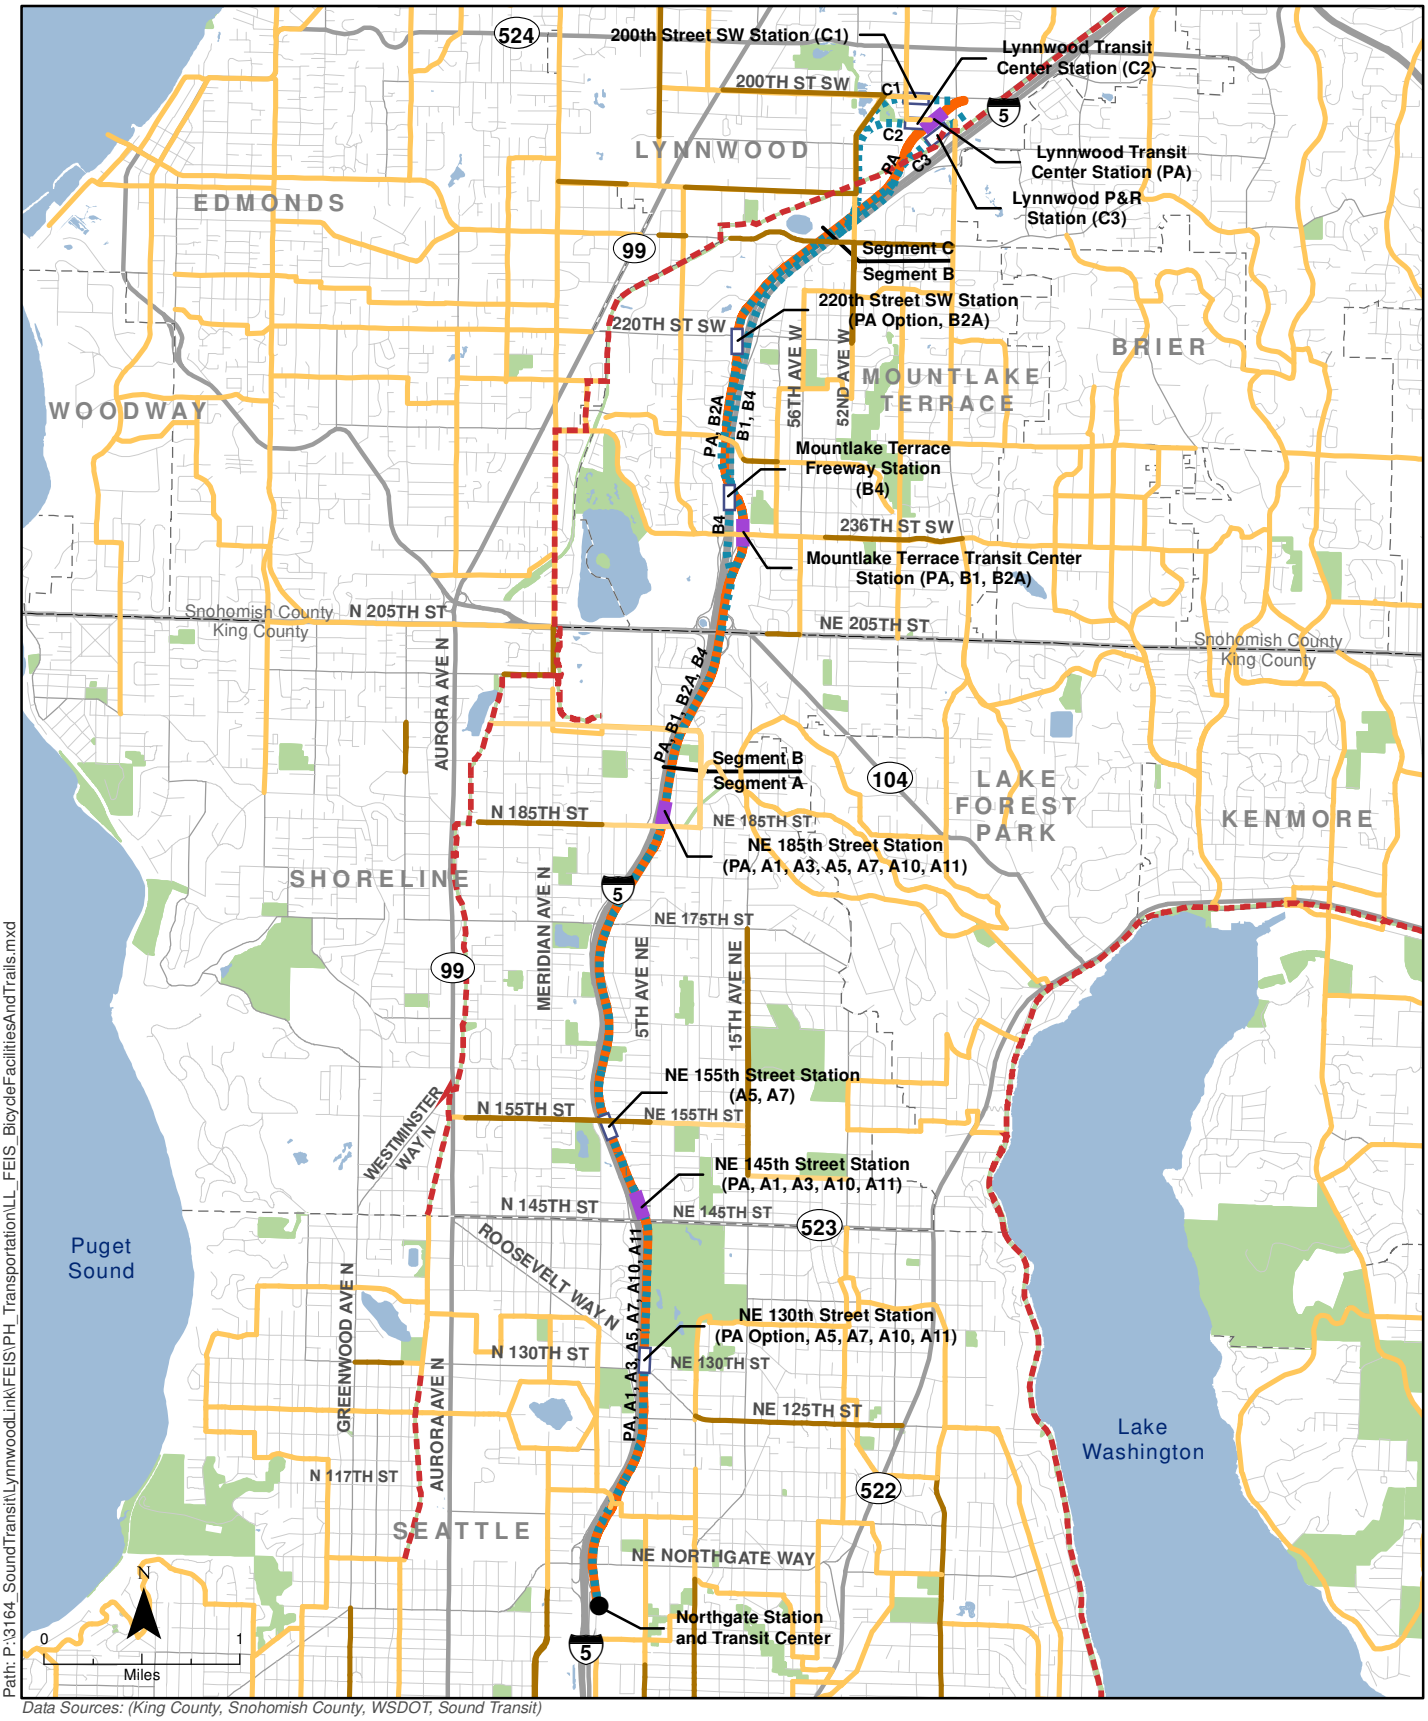

Figure 3-5
Bicycle Facilities and Regional Multi-Use Trails

Lynnwood Link Extension

Note: This map represents general shared roadways as identified by Data Sources. It does not reflect adopted inventories and planned projects by local jurisdictions. Refer to the Transportation Technical Report for inventory of sidewalks and bicycle facilities in the vicinity of each station.

Bicycle Facilities

The inventory for bicycle facilities includes arterials and multi-use trails within 1 mile of each proposed station location.

Segment A: Seattle to Shoreline

In Seattle, arterials such as 1st Avenue NE, NE 117th Street, and 5th Avenue NE have wide curb lanes adjacent to sidewalks or paved shoulders. However, many of the roadways surrounding the proposed NE 130th Street and NE 145th Street Stations lack constructed bicycle facilities. There are sharrows along portions of 1st Avenue NE, Roosevelt Way NE, and NE 125th Street. In Shoreline, bicycle lanes or striped and paved shoulders exist on parts of North 155th Street, 15th Avenue NE, NE 185th Street, 10th Avenue NE, and NE Perkins Way. A planned project by the City of Shoreline will provide sharrows along 10th Avenue NE, and on NE 180th Street between 10th Avenue NE and 15th Avenue NE.

The Cities of Seattle and Shoreline use a pavement marking called a "sharrow" to define streets that should be shared with bicycles.

Segment B: Shoreline to Mountlake Terrace

A pedestrian and bicycle overcrossing of I-5 exists at NE 195th Street, and a paved multi-use trail runs along NE 195th Street from 1st Avenue NE to Meridian Avenue North. The Interurban Trail, a regional facility, is approximately 1 mile west of the Mountlake Terrace Transit Center and connects Lynnwood with Mountlake Terrace. There are bicycle lanes on parts of 228th Street SW and 230th Street SW, but no bicycle facilities are available on arterials in the 220th Street SW area.

Segment C: Mountlake Terrace to Lynnwood

In Segment C, bicycle lanes are available on 52nd Avenue West and Cedar Valley Road from 208th Street SW north to 200th Street SW. There is also a shared-lane bicycle facility on 200th Street SW. The Interurban Trail passes through Lynnwood generally following the Snohomish County PUD power line right-of-way, and then it becomes an on-street facility adjacent to 52nd Avenue West between 208th Street SW and the power line segments (where the City of Lynnwood has a planned trail improvement). Continuing north, the trail follows the power line, crosses over 44th Avenue SW on a pedestrian/bicycle bridge, and then continues adjacent to the west side of I-5.

3.1.7 Freight Mobility and Access

Freeways, arterials, and local roadways carry freight in and through the study area. The Washington State Freight and Goods Transportation System (FGTS) classifies highways, county roads, and city streets according to the average annual gross truck tonnage they carry. Classifications range from T-5, which includes roadways that

carry over 20,000 tons in 60 days and less than 100,000 tons per year, to T-1, which includes roadways that carry over 10 million tons per year.

I-5 is the principal freight route (classified as T-1) through the Puget Sound region. For further details and maps showing the FGTS and City freight route classifications by segment, refer to the *Transportation Technical Report*.

3.1.8 Parking

Parking surveys were conducted to inventory the available on- and off-street parking and midday utilization of on- and off-street parking within approximately 0.25 mile of the proposed station locations and along the proposed footprint of the light rail alignments. Table 3-7 lists the existing unrestricted on-street and off-street parking and supply information near the proposed stations. For further detail and maps showing the area that was inventoried for each station, refer to the *Transportation Technical Report*.

Table 3-7. Existing Unrestricted On-Street and Off-Street Parking Supply and Midday Utilization by Station

	On-Street			Off-Street[a]		
Station	Supply	Utilization	Percent Utilization	Supply	Utilization	Percent Utilization
Segment A: Seattle to Shoreline						
Along the proposed light rail alignment	130	12	9%	19	12	63%
NE 130th Street[b]	430	60	14%	290	40	14%
NE 145th Street	450	120	27%	350	250	71%
NE 155th Street	580	100	17%	200	50	25%
NE 185th Street	700	80	11%	300	130	43%
Segment B: Shoreline to Mountlake Terrace						
Along the proposed light rail alignment	NA	NA	NA	NA	NA	NA
Mountlake Terrace Transit Center	440	70	16%	990	870	88%
Mountlake Terrace Freeway Station	640	50	8%	990	870	88%
220th Street SW	610	70	11%	1,300	680	52%
Segment C: Mountlake Terrace to Lynnwood						
Along the proposed light rail alignment	30	7	23%	305	235	77%
Lynnwood Park-and-Ride	0	0	NA	3,020	2,050	68%
Lynnwood Transit Center	10	10	100%	3,720	2,410	65%
200th Street SW Station	90	40	44%	4,420	2,510	57%

Note: Data were collected in May 2012 on all roads within 0.25-mile radius of the stations. Utilization was counted between 9 am and 11 am and between 1 pm and 4 pm.

[a] Off-street parking supply and utilization includes parking on private property.

[b] On-street parking supply in the NE 130th Street Station area includes 400 unrestricted parking spaces and 30 time-restricted spaces.

3.1.9 Safety

To describe safety conditions in the study area and to identify locations with higher rates of accidents, Sound Transit collected accident data from local jurisdictions and WSDOT for the 4-year period 2010 to 2013 for the same intersections and roadway segments identified for operational analysis, and for I-5 between Northgate and Lynnwood. Accident rates were calculated (in accidents/year, along with traffic volumes) to give an indication of high accident occurrence.

Along I-5, between 80 to 85 percent of the accidents were congestion-related, involving rear-end collisions from slowing or stopped traffic, or sideswipe collisions from merge or weave movements, and these occurred most often during peak periods. Other collisions, involving vehicles leaving the roadway, and fixed object collisions, made up the remaining incidents, and tended to be at nighttime.

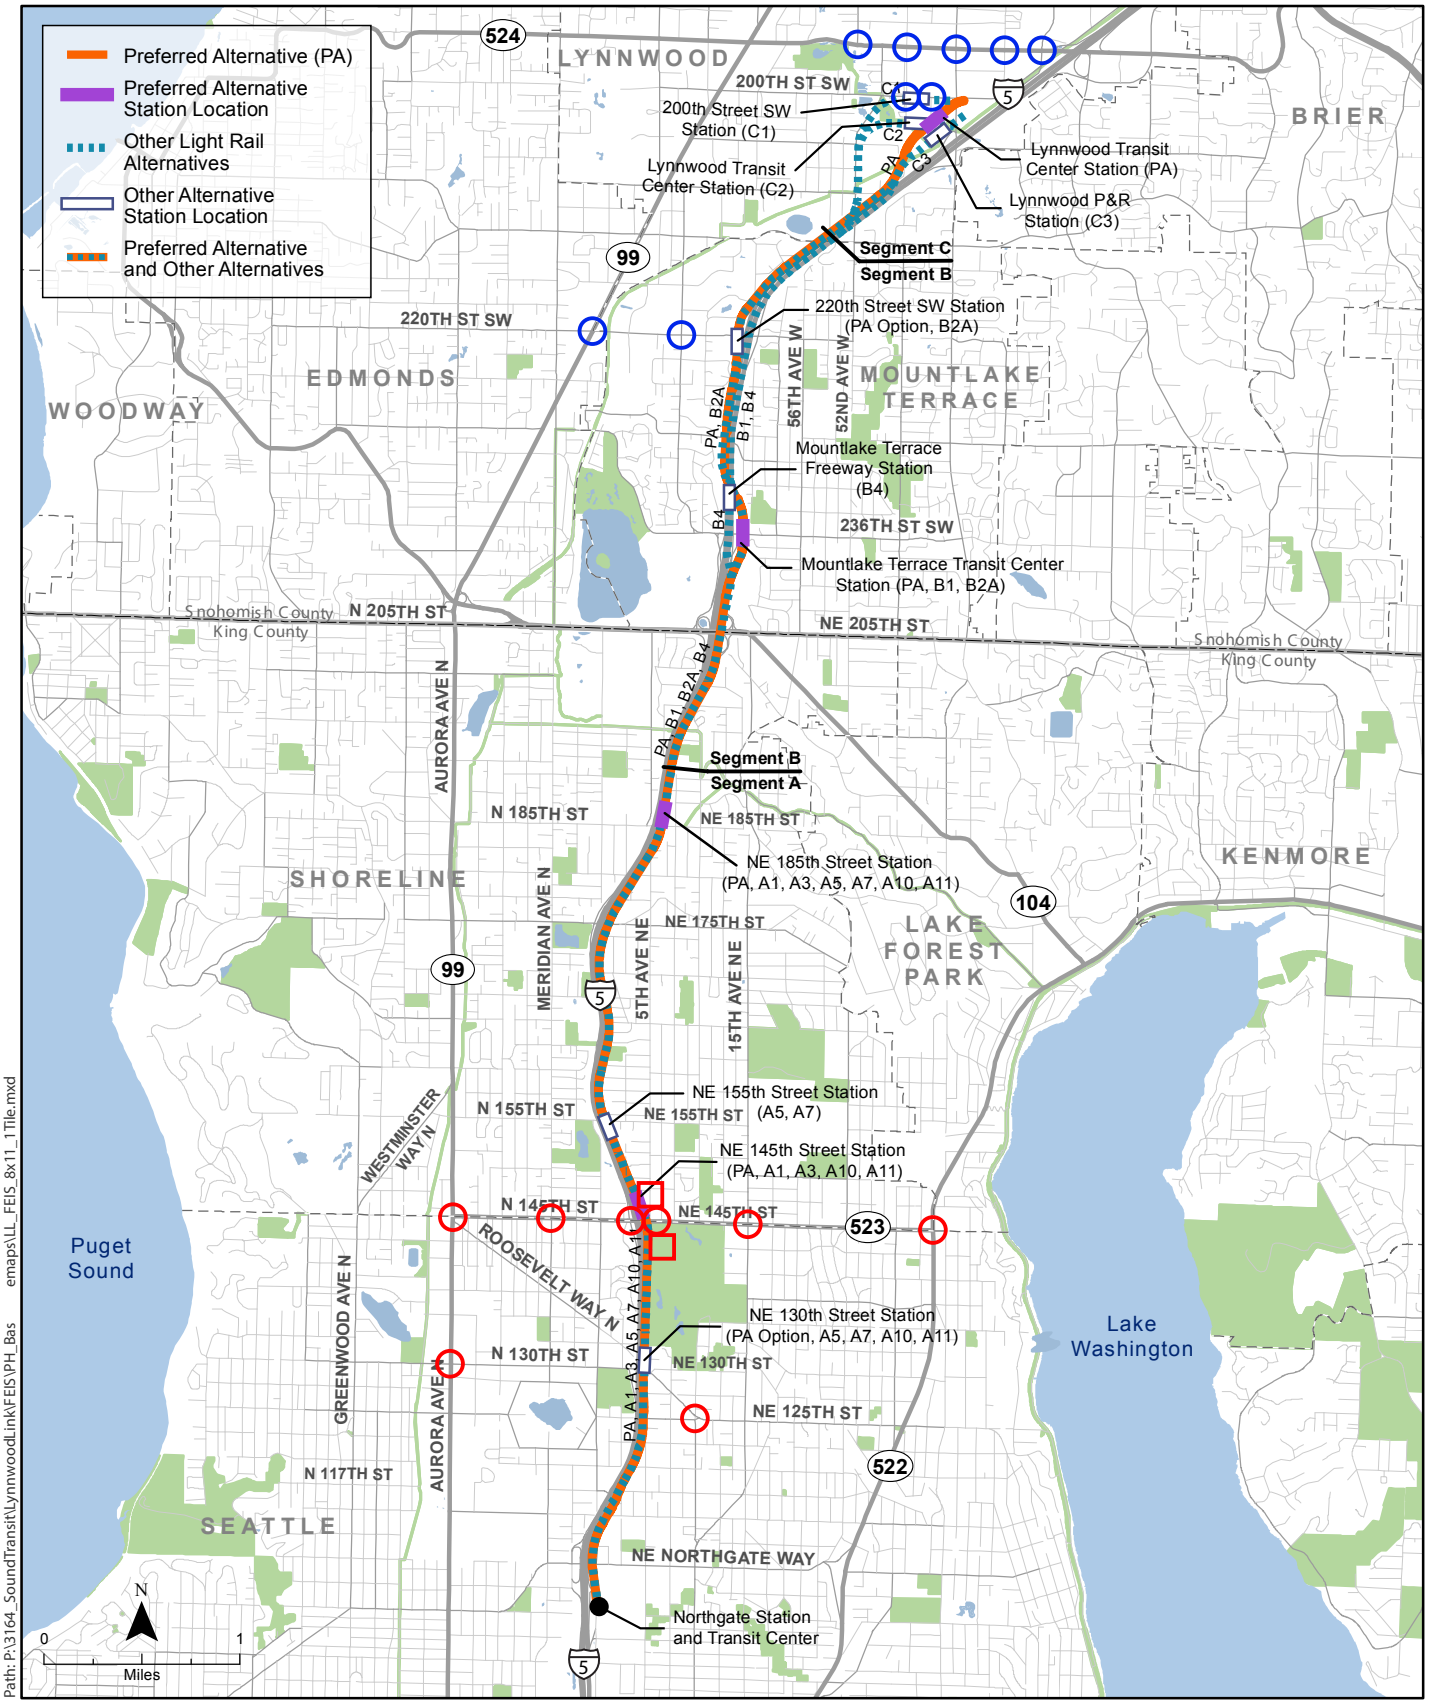
The City of Seattle identifies collision analysis locations (CALs) for future safety improvements at signalized intersections experiencing more than 10 collisions per year, and at unsignalized intersections with 5 collisions per year. For other jurisdictions, locations where the accident rate is at or exceeds 1.0 accidents per million entering vehicles were identified as CALs. Figure 3-6 shows the existing CALs. These CALs are concentrated around the following areas: 196th Street SW, 200th Street SW, 220th Street SW, Aurora Avenue North, and North/NE 145th Street. Details of the full analysis are in the *Transportation Technical Report*.

3.2 Long-Term Impacts

3.2.1 Regional Travel

Miles Driven and Hours Spent in Travel

By 2035, ridership on the Preferred Alternative and other light rail alternatives would help reduce automobile travel in the region by approximately 300,000 miles per day compared to the No Build Alternative (a reduction of approximately 0.3 percent), and about 25,000 fewer hours per day would be spent traveling by automobile (a reduction of approximately 0.8 percent). A significant portion of this reduction is expected to occur within the project corridor as new riders shift from automobile to transit. Table 3-8 shows the systemwide vehicle miles of travel and vehicle hours of travel in the Puget Sound region for the No Build Alternative, Preferred Alternative, and other light rail alternatives in forecast year 2035.



Collision Analysis Locations

- In Seattle, signalized locations with greater than 10 collisions per year
- In Seattle, unsignalized locations with greater than 5 collisions per year
- All other jurisdictions, signalized locations with greater than 1.0 accidents per million entering vehicles (MEV)
- All other jurisdictions, unsignalized locations with greater than 1.0 accidents per million entering vehicles (MEV)

Figure 3-6
Existing Collision Analysis Locations in Study Area

Lynnwood Link Extension

Table 3-8. Daily Vehicle Miles of Travel and Vehicle Hours of Travel in the Puget Sound Region for Forecast Year 2035

Alternative	VMT	VHT
No Build Alternative	100,600,000	3,140,000
Preferred Alternative and Other Light Rail Alternatives	100,310,000 – 100,330,000	3,115,000 – 3,117,000

Source: Sound Transit Highway Model.
VMT = vehicle miles of travel, VHT = vehicle hours of travel

Vehicles Traveling through the Corridor

During the AM and PM peak hours, the improved transit service provided by the Preferred Alternative and other light rail alternatives would attract more trips to transit, and hence slightly reduce vehicle volumes and congestion in the corridor. Table 3-9 shows year 2035 peak hour vehicle volumes and peak hour v/c ratios at north-south screenlines crossing the project corridor. This also reflects, in part, the additional HOV lane capacity made available for other vehicles with the truncation of bus routes that currently operate in the I-5 HOV lanes. Approximately 550 to 600 daily bus trips would be removed from the I-5 HOV lanes. The *Transportation Technical Report* has additional information, including daily vehicle volumes and v/c ratios for these three north-south screenlines and one east-west screenline.

Table 3-9. Screenline Volumes and Volume-to-Capacity Ratios

	2035 No Build Alternative				2035 Preferred Alternative and Other Light Rail Alternatives			
	AM Peak Hour V/C[a]		PM Peak Hour V/C[a]		AM Peak Hour V/C[a]		PM Peak Hour V/C[a]	
Screenline Location	NB	SB	NB	SB	NB	SB	NB	SB
North of NE Northgate Way	0.47 (8,600)	1.03 (19,300)	1.13 (21,000)	0.71 (13,300)	0.45 (8,400)	1.00 (18,800)	1.09 (20,500)	0.70 (13,100)
South of North 205th Street	0.44 (7,300)	0.98 (14,800)	0.98 (16,400)	0.74 (11,200)	0.43 (7,200)	0.95 (14,400)	0.94 (15,900)	0.72 (11,000)
South of 196th Street SW	0.55 (6,500)	0.95 (11,100)	1.04 (12,200)	0.73 (8,500)	0.54 (6,400)	0.94 (10,900)	1.03 (11,900)	0.73 (8,500)

People Traveling through the Corridor

Compared to the No Build Alternative, the Preferred Alternative and other light rail alternatives would allow the project corridor to carry more people (person throughput) during the peak periods, as measured by screenlines across the corridor.[2] The PM peak (northbound) direction is projected to have the largest increase (Table 3-10) in total trips by all modes on I-5, SR 99, and other north-south arterials. The total person throughput in both directions would increase by approximately 3 percent north of NE Northgate Way and by 4 percent south of North 205th Street. On I-5 only, up to a 10 percent increase in person throughput is expected with the Preferred Alternative and other light rail alternatives compared with the No Build Alternative.

[2] Sound Transit Highway Model is based on the PSRC Regional Model: WSDOT Project Version.

Table 3-10. Projected Person Throughput—PM Peak Period for Forecast Year 2035

Screenline Location	Alternative	Northbound	Southbound	Total
North of NE Northgate Way	No Build Alternative	86,000	48,000	134,000
	Light Rail Alternatives	89,000	49,000	138,000
South of North 205th Street	No Build Alternative	66,000	39,000	105,000
	Light Rail Alternatives	69,000	40,000	109,000

3.2.2 Transit

Regional Transit

Overall regional transit use (on both bus and rail) would increase by up to 22,000 daily transit trips with light rail in place, compared with the No Build Alternative (an increase of approximately 4 percent). There would be direct light rail service from Lynnwood to Northgate, the University District, Capitol Hill, downtown Seattle, south of downtown Seattle, the Rainier Valley, and Sea-Tac Airport. Light rail connections would also be provided to Bellevue, Bel-Red, and Overlake. In addition, light rail in the I-5 corridor would substantially improve transit service reliability to LOS A compared to LOS C or worse with the No Build Alternative. The frequency of transit throughout the day would also improve because light rail would operate with midday headways of 5 to 10 minutes, compared with midday headways of 15 minutes on the most frequent bus routes. Light rail would also provide service for more hours of the day and to more destinations, such as Shoreline and the Mountlake Terrace Transit Center.

Transit Facility and Service Characteristics

With the light rail alternatives, a number of transit facility improvements would be implemented, including new light rail stations and new or expanded park-and-ride and bus layover facilities at some of the stations. Proposed park-and-ride facilities are discussed in Section 3.2.7. Other bus facility improvements are discussed in the *Transportation Technical Report*. Before the project begins operation, Sound Transit would work with the other transit providers in the project area to revise service plans to avoid duplicating service and to provide improved or new connections to the Lynnwood Link Extension. Sound Transit worked with King County Metro, Community Transit, and Sound Transit Express to outline representative bus operations plans that could be used to serve the Lynnwood Link Extension stations to evaluate the effects of potential service changes for the EIS. Detailed service planning would be conducted before the system opens to the public, and any changes to service would go through a public comment process before each agency would proceed with service changes. The conceptual bus operations plans developed by the transit providers have low and high service scenarios, covering a range of potential future revenue scenarios. The low service scenarios were assumed for the ridership forecasting effort to avoid over-

predicting the number of people taking buses to the station, while the higher service scenarios were used to conservatively establish the size of the bus facilities at each station. More details on these plans are provided in the *Transportation Technical Report* and the *Ridership Forecasting Technical Report.*

Ridership

Transit ridership forecasts for the Lynnwood Link Extension range from 63,000 to 74,000 daily trips on the Lynnwood Link Extension in 2035 (the total of all three segments with any combination of alternatives), which would be more than double the bus ridership in the No Build Alternative. The median ridership for the Preferred Alternative would be approximately 68,000 daily riders. The Lynnwood Link Extension would add up to 22,000 new daily transit trips (on both bus and rail) throughout the region. Table 3-11 shows daily transit trips (ridership) in the project corridor in Base Year 2011 compared with the No Build Alternative, Preferred Alternative, and other light rail alternatives in 2035. Total daily trips (ridership) account for riders on the Lynnwood Link Extension, regardless of where they board the train. The forecasts for the Preferred Alternative and other light rail alternatives assume there would be no bus service on I-5 north of Northgate because light rail would replace I-5 bus routes serving areas between Northgate and Lynnwood, and I-5 routes north of Lynnwood would feed to the Lynnwood Transit Center Station.

Table 3-11. Daily Corridor Transit Riders in Base Year (2011) and Forecast Year (2035)

	Bus Riders		Light Rail Project Riders
Bus Route/Light Rail Ridership (measured by individual trips)	**Base Year (2011)**	**No Build Alternative (2035)**	**Light Rail Alternatives (2035)**
I-5 Bus Routes North of Northgate	19,400	32,000 to 34,000	---
Daily Light Rail Riders North of Northgate	---	---	63,000 to 74,000

Source: Sound Transit Ridership Model.

Figure 3-7 shows the average weekday boardings in 2035 by station under different station combinations for the Preferred Alternative and optional stations, as well as all other light rail alternative station combinations. Figure 3-7 also includes the Northgate Station (which would already be in place under all alternatives) to show how boardings at stations to the north would affect boardings at Northgate. These boardings show only the trips starting at each Lynnwood Link Extension station, while the total trips shown in Table 3-11 count all trips to or from any station for the project. Figure 3-7 shows how the number of boardings at several of the stations would vary depending on the combination of segment alternatives and the number of total stations that would be in place.

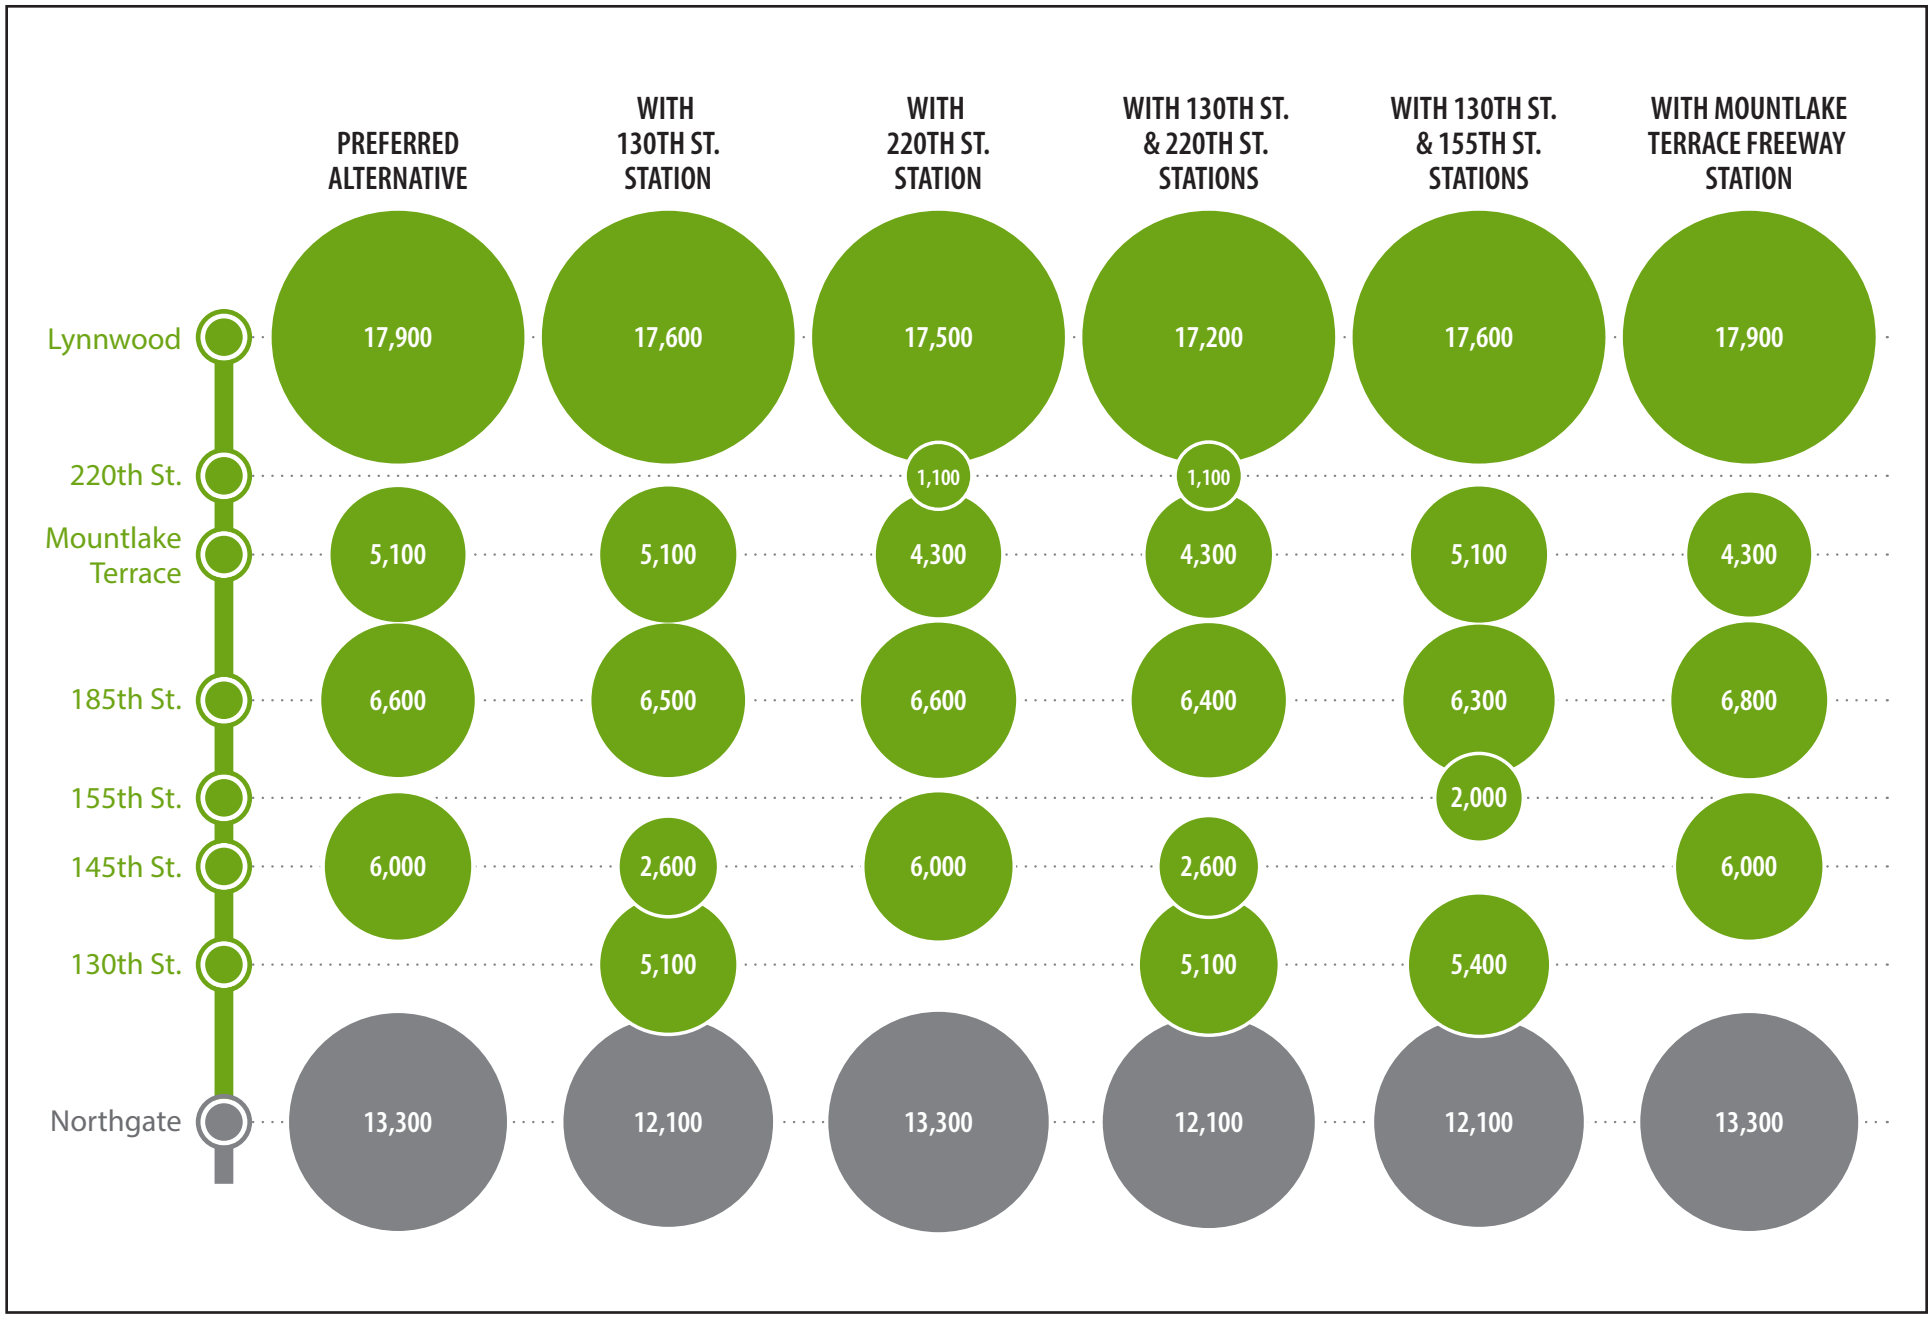

Figure 3-7
2035 Average Weekday Station Boardings for the Preferred Alternative and Options

There would not be large differences in ridership among the alternatives, but there would be some minor ridership trade-offs among the different station combinations. Some of the key trade-offs for the Preferred Alternative and its optional stations include:

- Adding the NE 130th Street Station as a third Segment A station would result in a net increase of 500 daily boardings in Segment A because it would provide additional access to the transit network. Approximately 1,200 of the daily boardings at the NE 130th Street Station would shift from the Northgate Station.
- Adding the 220th Street SW and NE 130th Street optional stations to the Preferred Alternative is projected to reduce daily boardings at the Lynnwood Transit Center Station by 700. Part of the reason for the net loss at the Lynnwood Transit Center, compared with a project without these two optional stations, is that adding the two optional stations would increase travel time for the light rail trip, which would be less attractive for riders traveling to and from Lynnwood. In addition, approximately 200 of the forecasted daily boardings would shift from the Lynnwood Transit Center to the new 220th Street SW Station.

The difference in boardings between alternatives is influenced by a combination of factors. These factors include the density of population and employment near stations, the amount of parking available at stations, local bus service connections at stations, additional travel time caused by additional stations elsewhere in the corridor, and distance between stations. Additional information on 2035 daily boardings for the Preferred Alternative, Preferred Alternative with options, and other light rail alternatives (including options) is in the *Transportation Technical Report*.

Transit Travel Times

Travel times to all regional destinations would be shorter with the Preferred Alternative and other light rail alternatives compared with the No Build Alternative. Tables 3-12 and 3-13 show estimated peak period transit travel times in forecast year 2035 between Shoreline and Lynnwood and regional destinations for the AM and PM peak periods for the No Build Alternative and light rail alternatives with four to six stations. Travel times under the No Build Alternative are expected to increase compared with existing conditions due to increased congestion. While the No Build Alternative travel times between destinations would vary between the AM and PM peak period due to different congestion levels, the travel times for light rail would be the same during the AM and PM peak period because light rail would not be affected by traffic congestion. The low end of the range represents travel times for the alternatives with fewer stations, and the higher end represents the alternatives with the most stations.

Table 3-12. Transit Travel Times from Shoreline and Lynnwood—AM Peak Period Southbound (minutes) for Forecast Year 2035

	From Shoreline		From Lynnwood	
Destination	No Build Alternative	Light Rail Alternatives	No Build Alternative	Light Rail Alternatives
Northgate	10	3-4	26	14-16
University of Washington	22	11-12	38	22-24
Capitol Hill	26	14-15	42	25-27
Downtown Seattle	22	16-17	43	27-29
Sea-Tac Airport	63	51-52	79	62-64
Downtown Bellevue	53	41-42	55	52-54
Overlake	63	51-52	79	62-64

Note: The No Build Alternative transit travel times include estimated transfer times where relevant. Actual total transit travel times would vary based on how people access transit, as well as their wait times.

Sources: King County Metro Trip Planner (http://metro.kingcounty.gov/) modified to reflect expected future traffic congestion; Sound Transit Highway Model, light rail travel time estimates.

Table 3-13. Transit Travel Times to Shoreline and Lynnwood—PM Peak Period Northbound (minutes) for Forecast Year 2035

	To Shoreline		To Lynnwood	
Destination	No Build Alternative	Light Rail Alternatives	No Build Alternative	Light Rail Alternatives
Northgate	10	3-4	24	14-16
University of Washington	22	11-12	36	22-24
Capitol Hill	26	14-15	40	25-27
Downtown Seattle	26	16-17	42	27-29
Sea-Tac Airport	63	51-52	77	62-64
Downtown Bellevue	53	41-42	64	52-54
Overlake	63	51-52	77	62-64

Note: The No Build Alternative transit travel times include estimated transfer times where relevant. Actual total transit travel times would vary based on how people access transit, as well as their wait times.

Sources: King County Metro Trip Planner, http://metro.kingcounty.gov/, Lynnwood Link Extension Project Highway Model, light rail travel time estimates.

Transfers

When transit riders need to transfer to complete a trip, they may see the transit system as being too complex and their travel times can feel longer or more unpredictable. As a result, they may choose not to use transit for the trip. However, the quality of transfers, whether between buses, between bus and rail, or from rail to rail, has a dramatic impact on how a rider views a transfer. Some of the factors that riders find important are the distances between the transfer points, wait time, waiting area conditions, reliability, safety and security, and availability of real-time arrival information.

Overall, future transfer rates with the light rail alternatives would be lower than the No Build Alternative. There would be fewer transfers because the Lynnwood Link Extension would connect with the Northgate Link Extension (under construction) and provide a no-transfer, one-seat transit trip between more destinations, including Shoreline/Lynnwood and the University District or downtown Seattle. Transfers

may be required to travel to future light rail destinations to the east, including downtown Bellevue and Overlake, although some trains may continue through to those destinations. Also, transfers in some parts of the regional system could increase as more riders use light rail for a part of their trip because it could reduce their overall travel times.

Transit Level of Service

Sound Transit analyzed transit service performance by using the *Transit Capacity and Quality of Service Manual*, 2nd Edition, Part 3, which is a nationally recognized resource for the measurement of transit capacity and quality of service (TRB 2003).

Service Frequency

When transit service is frequent, riders typically have shorter wait times before they board, and this translates into a high level of transit service. Bus routes that have headways of less than 10 minutes are considered ideal, while headways above 60 minutes are undesirable.

The Preferred Alternative and other light rail alternatives would provide headways under 10 minutes for service connecting North Seattle, Shoreline, Mountlake Terrace Transit Center, and Lynnwood Transit Center to downtown Seattle, Eastside communities, and south King County, which would markedly improve service to these locations compared with the No Build Alternative. Also, travel times would improve between these station areas and other light rail stations, such as Sea-Tac Airport, Capitol Hill, and the University District.

Hours of Service

Hours of service is another measure of transit service quality. The longer that transit service is provided throughout a 24-hour period, the more available it is to riders, resulting in better levels of service. Service that covers 19 or more hours in a day is optimal, and service of less than 3 hours a day is undesirable.

The Preferred Alternative and other light rail alternatives would provide more than 19 hours of service daily for North Seattle, Shoreline, Mountlake Terrace Transit Center, and Lynnwood Transit Center, giving them higher level of service ratings compared to the No Build Alternative.

Passenger Load

To measure passenger comfort and how easily a rider can find a seat, transit operators calculate the passenger load. When the passenger load exceeds the number of seats or available standing space, transit is overcrowded and offers a poor level of service (LOS E or F) for the passenger load; therefore, the transit service provider may need to increase service frequency. Lighter passenger loads with readily available seats or ample standing room are given high ratings (LOS A or B).

With the Preferred Alternative and other light rail alternatives, the passenger loads on buses and light rail would improve compared with the No Build Alternative. Table 3-14 shows the PM peak hour passenger load LOS ratings for transit in the corridor at three locations for the No Build Alternative, Preferred Alternative, and other light rail alternatives in forecast year 2035. With the No Build Alternative, the passenger load LOS for bus service on I-5 is expected to be between LOS D and F, while the Preferred Alternative and other light rail alternatives would improve conditions to LOS A in most locations.

Table 3-14. PM Peak Hour Passenger Load Level of Service in Forecast Year 2035

		No Build Alternative	Preferred Alternative and Other Light Rail Alternatives	
Screenline Location	**Direction**	**Bus**	**Bus**	**Light Rail**
North of NE Northgate Way	Northbound	D	A	C
	Southbound	F	A	A
South of North 205th Street	Northbound	E	A	A
	Southbound	F	A	A
North of 212th Street SW	Northbound	D	A	A
	Southbound	F	A	A

Reliability and On-time Performance

Under the No Build Alternative, bus service would be less reliable than today as traffic congestion grows on freeways and arterials in the corridor (see Section 3.2.3). Forecasts show future speeds will decrease along I-5 as congestion increases. Buses would be less reliable and would often arrive close together (bunched) rather than at scheduled times and intervals. In contrast, all light rail alternatives would operate very reliably within the I-5 corridor because light rail would operate entirely outside of traffic in the corridor, although delays elsewhere in the system could still affect occasional trips.

Local and Regional Transit

With any of the light rail alternatives, Sound Transit would work with King County Metro and Community Transit to consider local or regional service revisions integrated with light rail service. A large number of light rail riders would access the system via local and/or regional bus service. Preliminary service integration plans by King County Metro and Community Transit were used to develop bus station requirements.

3.2.3 Freeway Operations

Freeway operations for the No Build Alternative, Preferred Alternative, and other light rail alternatives were evaluated using traffic simulation software along I-5

between the Northgate Way interchange in Seattle and 196th Street SW interchange in Lynnwood. Freeway traffic volumes for 2035 used for this analysis were estimated using growth rates derived from the Sound Transit Highway Model. Additional discussion, including traffic volume forecasts and traffic operations results, is in the *Transportation Technical Report*.

No Build Alternative

By 2035, freeway operations are projected to worsen over today's already congested conditions. I-5 traffic volumes between the NE 130th Street interchange and the 196th Street SW interchange in Lynnwood are expected to increase between 3 and 8 percent over existing conditions except for the northbound (off-peak) direction in the AM peak hour, which would increase between 10 and 15 percent over existing conditions. These traffic volume forecasts generally reflect higher growth, particularly in the northbound direction during the AM peak hour because this section of I-5 is currently not operating at capacity and therefore has greater potential for growth in vehicular demand.

During the AM peak hour, average vehicular speeds on southbound I-5 between the NE 130th Street interchange and south of the SR 104 interchange are expected to be 35 mph or slower, which means the freeway would be operating at LOS F. North of the SR 104 interchange, I-5 speeds are forecasted to be higher, with freeway operations at LOS C or D. Similar to existing conditions, during the AM peak period southbound, freeway congestion would be caused by the high volumes of entering and exiting traffic, specifically at the two southbound on-ramps from NE 145th Street and SR 104. Traffic from these ramps are forecast to influence mainline vehicular speeds at critical merging areas. In the northbound (off-peak) direction, I-5 would continue to be relatively uncongested with average speeds ranging from 44 mph near the SR 104 interchange to 56 mph and would operate at LOS C or D (free-flow conditions).

During the PM peak hour, average northbound peak period speeds would range from approximately 17 mph north of the NE 145th Street on-ramp to approximately 51 mph in Lynnwood. I-5 would continue to operate under highly congested conditions (LOS E and F), with high volumes of merging and diverging traffic. In particular, merging and diverging activity near the off-ramps to NE 130th Street, NE 175th Street, and SR 104 would cause noticeable mainline disruptions with average speeds expected to decrease to 20 mph or less.

In the southbound (off-peak) direction, speeds on I-5 are projected to range from approximately 45 to 55 mph approaching the 220th Street SW off-ramp and the NE 145th Street off-ramp. I-5 would operate relatively well (LOS D), except for the area approaching NE 145th Street and 220th Street SW, where high southbound off-ramp volumes are projected in the No Build conditions and would cause delays and

queues that could extend onto the freeway mainline at times. Similar to typical existing operations, I-5 traffic south of the NE 130th Street and NE Northgate Way interchanges would slow noticeably in the PM peak hour.

Although change to WSDOT's HOV policy was not explicitly evaluated, HOV lane speeds and performance are also expected to degrade, particularly in the peak direction, which would affect reliability and travel times for carpools and buses.

Light Rail Alternatives

While systemwide VMT and VHT in the Puget Sound region is forecast to decrease with the Preferred Alternative and other light rail alternatives (as described in Section 3.2.1), peak hour volumes along the I-5 mainline and ramps would be similar to the No Build Alternative. Traffic traveling to and from the proposed park-and-ride lots is projected to originate primarily from the local street system and would not create noticeable increases in I-5 volumes or affect AM/PM peak hour freeway speeds and performance (e.g., LOS). A small amount of the park-and-ride trips, less than 5 percent, is assumed to be heading north on I-5 from the Lynnwood Transit Center.

During the AM peak hour, northbound and southbound freeway operations and speeds for all light rail alternatives would be similar to conditions under the No Build Alternative. The majority of impacts caused by the proposed light rail stations and park-and-ride lots would be to local arterials instead of I-5 operations (see the discussions below under Arterial and Local Streets).

During the PM peak hour, the Preferred Alternative and three other light rail alternatives (Alternatives A1, A5, and A10) would improve freeway operations along northbound I-5 due to the reconfiguration of the northbound NE 130th Street off-ramp. The proposed reconfiguration and grade separation of the northbound NE 130th Street off-ramp with southbound 5th Avenue NE would allow the removal of the off-ramp stop-control. Northbound I-5 speeds just south of the NE 130th Street off-ramp would improve by approximately 5 mph. Although the freeway level of service would remain at LOS F, the traffic density would improve. Speeds north of the NE 130th Street off-ramp could decrease because more traffic would be able to get through the improved configuration at the NE 130th Street off-ramp; this increased volume could add to congestion near the NE 145th Street off-ramp. Alternatives A7 and A11, with a station at NE 130th Street but without the updated off-ramp reconfiguration, would experience speeds similar to conditions under the No Build Alternative on I-5 south of the NE 130th Street off-ramp.

During the PM peak hour in the southbound direction, operations and speeds on I-5 for the Preferred Alternative and other light rail alternatives (A1, A3, and A11) would not change compared with the No Build Alternative. The project design includes street and intersection improvements near the NE 145th Street interchange that accommodate the added traffic from the park-and-ride and maintain or improve

local street operations compared to No Build conditions; this in turn allows operations on the freeway and ramps to be the same or better than No Build conditions. The local street improvements include relocation and signalization of the northbound on-ramp intersection to the north as well as adding a westbound right-turn lane on NE 145th Street at 5th Avenue NE.

The one exception is with Alternative A10, which has a different station layout and more parking spaces (650 total) at the proposed park-and-ride. The added traffic drawn to the larger parking facility would require further mitigation to the arterial system to avoid a small decrease in I-5 speeds approaching the NE 145th Street southbound off-ramp. See Section 5.3.1 of the *Transportation Technical Report* for more detail on the light rail alternatives' effects on arterial levels of service and I-5 speeds in this area.

In addition, the Preferred Alternative and other light rail alternatives would reduce the number of buses in the I-5 HOV lanes (approximately 550 to 600 daily bus trips would be removed), which would create additional HOV capacity and improve HOV operations and speeds compared with the No Build Alternative.

3.2.4 Arterials and Local Streets

This subsection describes the effects of the No Build Alternative, Preferred Alternative, and other light rail alternatives on arterial and local street operations. The project's potential effects on traffic volumes, intersection LOS, and property access and circulation are also discussed. The *Transportation Technical Report* provides a detailed discussion of traffic volume forecasts as well as impact analysis assumptions and results.

Traffic Forecasts and Station Trips

To evaluate the impacts of the No Build Alternative and the light rail alternatives on arterials and local streets, Sound Transit forecasted traffic conditions in 2035 to determine the number of vehicles on local roadways with or without the project. Forecast year 2035 traffic volumes were developed using the Sound Transit Highway Model, which reflects PSRC's current population and land use forecasts.

Overall, by 2035, peak hour traffic volumes for the No Build Alternative in the study area are predicted to increase by an average 0.7 percent to as high as 1.3 percent per year. The Lynnwood Link Extension could increase trips to station areas, but at the same time it could reduce automobile trips in other parts of the study area as people shift from private automobiles to light rail.

For the Preferred Alternative and other light rail alternatives, Sound Transit predicted the number of trips that would be generated by each station, including automobile trips to and from the park-and-ride facilities, passenger drop-off/pick-up trips, and new bus trips. The traffic analysis assumes all park-and-rides would be

full. The predicted trip generation rates to the park-and-rides are consistent with survey data from Sound Transit's commuter rail stations, Central Link light rail park-and-rides, as well as national sources. The Sound Transit Ridership Model predicted which travel mode (e.g., bus, bicycle, pedestrian, passenger drop-off/pick-up, or drive alone) people were likely to use to access each station.

In general, the stations generating the highest number of vehicle trips are those with the highest number of new park-and-ride spaces. These include the NE 145th Street, NE 155th Street, NE 185th Street, and Lynnwood Transit Center stations. Overall, the Lynnwood Transit Center Station is expected to generate the highest number of vehicle trips. This station would be the northern terminus of the project, with the highest overall number of park-and-ride spaces and the most light rail patrons.

Traffic Operations

The traffic operations analysis compares the No Build Alternative, Preferred Alternative, and light rail alternatives in forecast year 2035 in the study area. The analysis locations were selected in coordination with local jurisdictions and include intersections in areas most likely to experience changes in traffic. These changes would likely be due to a change in channelization, access or signal control, or increased traffic to light rail stations. The light rail stations that would have new or larger park-and-rides or anticipated passenger pick-up and drop-off activity would be most likely to increase traffic.

The analysis results indicate most intersections in the Preferred Alternative and other light rail alternatives would operate at an LOS similar to that of the No Build Alternative. Some intersections around stations may degrade below the jurisdiction's LOS standard without effective improvements. The impact would be caused by traffic to and from park-and-ride facilities and by passenger drop-off/pick-up activity. Figures 3-8a, 3-8b, 3-9a, and 3-9b summarize the PM and AM peak hour LOS analysis results for the No Build Alternative (in forecast year 2035), and indicate where the Preferred Alternative and other light rail alternatives would cause LOS to degrade below standards. Locations where LOS would operate below standards in 2035 are described in the following subsections and the *Transportation Technical Report*.

Segment A: Seattle to Shoreline

Tables 3-15 and 3-16 list the locations in Segment A that would operate below LOS standards in forecast year 2035 with the No Build Alternative, Preferred Alternative, and/or other light rail alternatives during the PM and AM peak hours, respectively. As shown in Table 3-15, 17 of the 67 intersections evaluated in Segment A would operate below LOS standards with the No Build Alternative during the PM peak hour. An additional two intersections would degrade below LOS standards during the PM peak hour with the Preferred Alternative, and between three and seven

intersections would degrade with the other light rail alternatives. For the AM peak hour (Table 3-16), four intersections would operate below LOS standards with the No Build Alternative. One additional intersection would degrade below LOS standards during the AM peak hour with Alternatives A1 and A3 (5th Avenue NE and I-5 northbound off-ramp).

City of Shoreline Arterial LOS

For the City of Shoreline, several arterials were evaluated for forecast year 2035 PM peak hour v/c ratios to ensure consistency with the City's concurrency standards. The v/c ratios for these arterials were compared with the City's v/c standard of 0.90 or lower for most principal and minor arterials. The following arterial segments would not meet the City of Shoreline's concurrency standard for principal and minor arterials with the No Build Alternative:

- Meridian Avenue North from North 155th Street to North 185th Street—northbound
- 5th Avenue NE from north of North 145th Street to NE 165th Street—northbound
- 15th Avenue NE south of and north of NE 155th Street—northbound
- NE 175th Street west of 15th Avenue NE—westbound
- NE 185th Street west of 1st Avenue NE—eastbound
- NE 185th Street east of 1st Avenue NE—westbound

In addition, the following arterial segments are projected to degrade to levels below the City of Shoreline's concurrency standards during the PM peak hour with the Lynnwood Link Extension:

- NE 185th Street east of Meridian Avenue NE—westbound (all Segment A alternatives)
- NE 185th Street from 2nd Avenue NE to 5th Avenue NE (all Segment A alternatives)

Segment B: Shoreline to Mountlake Terrace

Table 3-17 lists the one location evaluated in Segment B that is expected to operate below LOS standards in 2035 with the No Build Alternative or any light rail alternatives during the PM peak hour. All of the evaluated intersections would meet LOS standards in the AM peak hour.

Table 3-17. Segment B Intersections not Meeting LOS Standards for Forecast Year 2035 During PM Peak Hour

Nearest Station and Intersection	LOS Standard	Alternative					
		No Build	Preferred Alternative[1]	B1	B1[1]	B2A	B4
220th Street SW Station							
220th Street SW and SR 99	E	F	F	*	F	F	*

* Location not analyzed for specified alternative. Intersection would be expected to operate similar to No Build Alternative.
[1] Similar effects with or without options (220th Street SW Station for the Preferred Alternative; added parking at Mountlake Terrace Station for Alternative B1).

Segment C: Mountlake Terrace to Lynnwood

Tables 3-18 and 3-19 list the locations in Segment C that are projected to operate below LOS standards in 2035 with the No Build Alternative, the Preferred Alternative, or other light rail alternatives during the PM and AM peak hours. As shown in Table 3-18, five out of the 22 intersections evaluated in Segment C would operate below LOS standards with the No Build Alternative during the PM peak hour. With the Preferred Alternative and other light rail alternatives, most of these intersections would operate with delays similar to the No Build Alternative. The two exceptions with the Preferred Alternative are the intersections at 200th Street SW and 48th Avenue West and 52nd Avenue West and 204th Street SW, which would have higher delays than the No Build Alternative. In the Final EIS, an option is being reviewed for the Preferred Alternative to have an additional 400 park-and-ride parking spaces at the Lynnwood Transit Center Station, which would also cause the intersection of 200th Street SW and 50th Avenue West to fall below operating standards in comparison with the No Build Alternative. This is due to the increased vehicle trips associated with the additional parking stalls. The intersection of 200th Street SW and 50th Avenue West would have higher delay than No Build for all light rail alternatives except for the Preferred Alternative. For the AM peak hour (Table 3-19), none of the intersections would operate below LOS standards with the No Build Alternative, but two intersections (200th Street SW/48th Avenue West and 200th Street SW/50th Avenue West) would degrade below LOS standards with the Preferred Alternative. For all other light rail alternatives, 200th Street SW and 44th Avenue West would degrade below LOS standards during the AM peak hour.

Table 3-18. Segment C Intersections not Meeting LOS Standards for Forecast Year 2035 During PM Peak Hour

200th Street SW and 50th Avenue West	D	C	**F**	C	C	C	C
200th Street SW and 48th Avenue West	D	C	**E**	D	D	D	D

Notes: LOS results highlighted in **BOLD** and grey shading indicate intersection locations where LOS with the light rail alternatives would degrade intersections to levels that do not meet the jurisdiction's LOS standard (see Section 3.6.4) or would worsen delays at intersections already below the jurisdiction's LOS standards with the No Build Alternative.

Property Access and Local Circulation

The alignment and station locations for the Preferred Alternative and other light rail alternatives could modify access for certain nearby properties, but these properties would still retain functional access. If access to a given property cannot be maintained, then the property would be acquired and identified as a displacement. Displacements are discussed in more detail in Section 4.1, Acquisitions, Displacements, and Relocations. The Preferred Alternative and other light rail alternatives would require some reconstruction of roadways adjacent to the elevated or at-grade alignments, but these areas are limited because most of the alignments are along I-5, and no long-term closures of existing roads are anticipated.

There could be cut-through traffic on neighborhood streets to access the stations via local streets, especially near stations where there is more congestion on the primary arterials serving the station, and where neighborhood streets could offer an alternative route, such as at the NE 155th Street Station, the NE 185th Street Station, and near the 220th Street Station. Property access and local circulation are discussed further in the *Transportation Technical Report*.

Circulation is currently compromised for side streets along NE 145th Street because of the difficulty in turning left from 6th Avenue NE, 10th Avenue NE, and 12th Avenue NE. With the No Build Alternative and all light rail alternatives, this movement would become more difficult in the future as volumes on NE 145th Street increase.

3.2.5 Nonmotorized Facilities

The evaluation of potential impacts on existing and future planned nonmotorized facilities resulting from the Lynnwood Link Extension are presented in this section. With the No Build Alternative, pedestrian activity near station areas would modestly increase over time as planned changes in land use occur and as future pedestrian improvements are implemented.

The Lynnwood Link Extension would increase the number of pedestrians in and around station areas within a typical 0.5-mile walking distance from the station. These increases would include walk trips to and from the following areas: light rail station platforms, park-and-ride facilities, designated passenger drop-off/pick-up areas, nearby bus stops, and surrounding neighborhoods. The Preferred Alternative and other alternatives would meet or exceed local jurisdictional, Sound Transit, and ADA design standards for pedestrian facilities fronting the station areas and roadways that are reconstructed as part of the project.

A more detailed description of pedestrian volumes at and near station areas is based on the projected number of patrons getting on or off the trains during the PM peak hour. Pedestrian volumes and LOS by alternative are summarized in the *Transportation Technical Report*. Specific locations where increased sidewalk widths are needed to accommodate peak pedestrian volumes are identified in the *Transportation Technical Report*. Design details will be further refined during final design.

With the No Build Alternative, bicycle activity near station areas would modestly increase over time as planned changes in land use occur and as future bicycle improvements are implemented.

The Preferred Alternative and other light rail alternatives are expected to increase the number of bicycles in the station areas, but they would not remove or otherwise adversely affect any of the existing or planned bicycle routes or facilities in the study area. This includes existing and planned facilities in the April 2014 *Seattle Bicycle Master Plan,* City of Shoreline 2011 *Bicycle System Plan,* and the *City of Shoreline Transportation Master Plan* (City of Seattle 2007; City of Shoreline 2011). Secure and covered bicycle parking and access would be provided at each station. In general, existing and planned bicycle facilities, implemented with reconstructed roadways, would sufficiently serve the increased levels of bicycle trips to the stations. Bicycle parking would generally be available at both ends of the stations to ease access for bicycle users. This would also minimize potential conflicts with pedestrians at stations.

3.2.6 Freight Mobility and Access

No changes to freight mobility and access are expected with the No Build Alternative beyond the increases in delay and roadway congestion that could occur over time.

With the Preferred Alternative and other light rail alternatives, freight truck traffic is expected to continue using designated FGTS and city streets for the movement of freight. In some locations, designated truck routes would travel alongside at-grade light rail profiles, but roadway and intersection conditions with the Lynnwood Link Extension would be similar to those with the No Build Alternative. Some intersection operations may improve through transportation mitigation for the Preferred Alternative or other light rail alternatives (see Section 3.6.4), which could benefit freight movement. Beyond these potential project effects, the *Transportation*

Technical Report describes the modifications to the roadway network associated with the Preferred Alternative or other light rail alternatives that could result in changes to freight mobility and access for each segment. These modifications are not anticipated to negatively affect truck circulation or change the truck route designations on the regional and local street network.

3.2.7 Parking

The Lynnwood Link Extension stations would include new, replacement, and additional park-and-ride capacity. Both on-street and off-street parking spaces are anticipated to be removed due to the placement of the light rail stations, surrounding roadway modifications, and modifications along the light rail alignment. As described in Chapter 2, Alternatives Considered, additional park-and-ride lots have generally been sized to accommodate forecasted parking demand. However, there is a possibility for parking spillover to occur at these stations if demand exceeds their capacity, particularly at the NE 130th Street Station.

At the NE 145th Street, NE 155th Street, and NE 185th Street Stations, a relatively large amount of unrestricted on-street parking exists in the vicinity of the stations; however, the potential for spillover parking is low due to the relatively large supply of parking spaces proposed for the park-and-rides. In station areas that currently lack available on-street parking supply, such as near the Lynnwood, 220th Street SW, and Mountlake Terrace station options, the potential for "hide-and-ride" parking activity (i.e., on-street parking by transit users in neighborhoods surrounding stations) would be limited. In these cases, if spillover parking occurred, it would likely be on privately owned off-street parking facilities. The potential for spillover parking impacts is discussed further in the *Transportation Technical Report*.

Changes in parking supply with the proposed park-and-ride parking spaces for each segment and alternative are described below. As part of this analysis, Sound Transit considered parking supplies within approximately 0.25 mile of each proposed station. Additional detail, including maps showing the area that was inventoried for each station, is in the *Transportation Technical Report*.

Segment A: Seattle to Shoreline

Table 3-20 summarizes the parking impacts along Segment A by alternative, not including removal of any existing park-and-ride lots and any off-street parking spaces associated with properties that might be acquired by the project. Parking at the Latvian Evangelical

Table 3-20. Segment A Parking Impacts

Alternative	Parking Spaces Removed[a]		
	On-Street	Off-Street[b]	Total
Preferred Alternative	69	0	69
Preferred Alternative with option	69	0	69
Alternative A1	69	0	69
Alternative A3	73	0	73
Alternative A5	89	0	89
Alternative A7	77	0	77
Alternative A10	96	0	96
Alternative A11	84	0	84

[a] Includes parking spaces removed for column placement where applicable.
[b] Off-street does not include park-and-ride spaces.

Lutheran Church would be modified but parking supply would be maintained. The Preferred Alternative would remove 69 parking spaces, while the other light rail alternatives would remove between 69 and 96 parking spaces due to column placement for the guideway.

Table 3-21 shows the proposed change in park-and-ride capacity at stations under each light rail alternative.

Table 3-21. Segment A Park-and-Ride Impacts and Proposed New Parking Spaces

Station	Alternative	Total Existing Parking Spaces	Removed Parking Spaces[a]	Proposed New Parking Spaces	Parking Spaces after Project	Net Change in Parking Spaces
NE 130th Street Station, with Park-and-Ride	Preferred Alternative with option, A5	46	46	100[b]	100[b]	+54
NE 130th Street Station, no Park-and-Ride	A10	46	46	0	0	-46
NE 130th Street Station	A7, A11	46	4	100	142	+96
NE 145th Street Station	A1	68	68	500	500	+432
NE 145th Street Station	A10	68	68	650	650	+582
NE 145th Street Station	Preferred Alternative, A3, A11	68	68	500	500	+432
NE 155th Street Station	A5, A7	0	0	500	500	+500
NE 185th Street Station	Preferred Alternative, A1, A3, A7, A11	0	0	500	500	+500
NE 185th Street Station	A5, A10	0	0	350	350	+350

[a] Includes parking spaces removed for column placement where applicable.

[b] Possible surface parking lot available for lease located near the station.

The discussion below focuses on areas where existing parking spaces would be removed; in other locations, the alternatives would add parking where a new station is proposed. The Preferred Alternative and Alternatives A5, A10, A7, and A11 would remove parking at the 5th Avenue NE/NE 133rd Park-and-Ride lot (46 spaces) and additional on-street parking near NE 145th Street, but these losses would be replaced with a new 500-space park-and-ride garage near the NE 145th Street Station. The Preferred Alternative would add a 500-space park-and-ride garage west of I-5 near the NE 185th Street Station.

For Alternatives A7 and A11, and an option for the Preferred Alternative, a NE 130th Street Station would remove the 5th Avenue NE/NE 133rd Park-and-Ride lot (46 spaces). The lot would also be removed with Alternatives A5 and A10. A nearby surface lot would replace the removed park-and-ride lot. Alternatives A7 and A11 would maintain the 5th Avenue NE/NE 133rd Park-and-Ride lot but columns would remove four of its parking spaces.

With the construction of the NE 145th Street Station, the Preferred Alternative and Alternatives A1, A3, A10, and A11 would remove the North Jackson Park Park-and-Ride lot (68 spaces), but a new 500- or 650-space garage would be added near the NE 145th Street Station, depending on the alternative.

Segment B: Shoreline to Mountlake Terrace

Table 3-22 summarizes the parking changes along Segment B by alternative. Alternative B2A would result in the loss of 11 on-street spaces. Table 3-23 shows the proposed changes in park-and-ride capacity at stations under each alternative.

Table 3-22. Segment B Parking Impacts

Alternative	Parking Spaces Removed[a]		
	On-Street	Off-Street[b]	Total
Preferred Alternative	0	0	0
Preferred Alternative with option	0	0	0
Alternative B1	0	0	0
Alternative B2A	11	0	11
Alternative B4	0	0	0

[a] Includes parking spaces removed for column placement where applicable.

[b] Off-street does not include park-and-ride spaces.

Table 3-23. Segment B Park-and-Ride Impacts and Proposed New Parking Spaces

Station	Alternative	Total Existing Parking Spaces	Removed Parking Spaces	Proposed New Parking Spaces	Parking Spaces after Project	Net Change in Parking Spaces
Mountlake Terrace Transit Center Station	B1, Preferred Alternative, B2A	880	0	0	880	0
Mountlake Terrace Transit Center Station	B1 with Option	880	220	500	1,160	+280
Mountlake Terrace Freeway Station	B4	880	0	0	880	0
220th Street SW Station	Preferred Alternative with Option, B2A	0	0	200	200	+200

Segment C: Mountlake Terrace to Lynnwood

Table 3-24 summarizes the parking impacts along Segment C by alternative, not including removal of any existing park-and-ride spaces because all of the removed park-and-ride spaces would be replaced. None of the light rail alternatives, including the Preferred Alternative, would remove on-street parking. The Preferred Alternative would remove 27 off-street parking spaces along the south side of 200th Street SW between 48th and 44th Avenues West. Alternatives C1 and C2 would remove eight and four off-street parking spaces,

Table 3-24. Segment C Parking Impacts

Alternative	Parking Spaces Removed[a]		
	On-Street	Off-Street[b]	Total
Preferred Alternative	0	27	27
Preferred Alternative with option	0	27	27
Alternative C1	0	8	8
Alternative C2	0	4	4
Alternative C3	0	0	0

[a] Includes parking spaces removed for column placement where applicable.

[b] Off-street does not include park-and-ride spaces.

respectively. There are several locations along Segment C where the alignment or light rail station would acquire a building. The parking associated with these locations was not considered a parking impact. Table 3-25 shows the proposed changes in park-and-ride capacity at stations under each alternative.

Table 3-25. Segment C Park-and-Ride Impacts and Proposed Parking Spaces

Station	Alternative	Total Existing Parking Spaces	Removed Parking Spaces[a]	Proposed New Parking Spaces	Parking Spaces after Project	Net Change in Parking Spaces
Lynnwood Transit Center—Modified Alternative	Preferred Alternative	1,370	1,120	1,650	1,900	+530
Lynnwood Transit Center—Modified Alternative with Additional Parking	Preferred Alternative with option	1,370	1,120	2,050	2,300	+1,030
200th Street SW Station	C1	1,370	370	900	1,900	+530
Lynnwood Transit Center	C2	1,370	670	1,200	1,900	+530
Lynnwood Transit Center	C3	1,370	1,120	1,650	1,900	+530

[a] Includes parking spaces removed for column placement where applicable.

At the Lynnwood Transit Center, the Preferred Alternative and other light rail alternatives would remove existing surface park-and-ride spaces and replace them with a new garage for a net total of 1,900 park-and-ride spaces. The Preferred Alternative also has an option that would maintain the surface lot west of 46th Street SW, for a net total of 2,300 park-and-ride spaces.

3.2.8 Safety

The Preferred Alternative and other light rail alternatives would have minimal effects on traffic safety in the project corridor because the alignments would be completely grade-separated from the street and highway networks, and the station areas would be designed for multimodal access and to minimize the potential for traffic conflicts.

The alternatives would not change the configuration of the I-5 roadway itself, nor would they affect traffic-operating conditions on the roadway; therefore, no operating impacts on I-5 related to safety are anticipated. The collision information on I-5 shows that most incidents are congestion-related due to slowing or stopped traffic in lanes, or from merge and weave actions. The Transportation Technical Report summarizes the collision data for I-5.

The alternatives involve structural and visual changes to parts of the I-5 roadside environment, which could affect safety conditions. New retaining walls, safety barrier, guardrails, or columns would be constructed along the roadway. The amount of increased hazard presented by these changes along I-5 differs by location, and depends on factors such as the highway configuration, traffic volumes, speeds, topography, the presence of shoulders or refuges, safety barriers or guardrails, and the distance between

the lanes and a new structure or barrier. While design measures may help reduce a safety concern, they may not fully remove it. For example, a guardrail in front of a structure may reduce the hazard presented by a new column along the roadway, but guardrails are also potential hazards. Such features of the project within the I-5 right-of-way must conform with FHWA's regulatory requirements for managing the right-of-way. The project would undergo a detailed safety analysis and further consideration of hazard minimization measures during final design as part of WSDOT and FHWA review and approval processes for the use of I-5 right-of-way.

Pedestrian and bicycle volumes are expected to increase at intersections near the proposed stations, which could result in an increased potential for pedestrian/vehicle, bicycle/vehicle, or pedestrian/bicycle conflicts. Bus trips would also increase near stations. The design of the station areas incorporates design features and standards that would reduce conflicts between travel modes.

The Preferred Alternative and other at-grade light rail alternatives are proposing stations and other improvements, including interchange modifications near existing collision analysis locations (CALs), notably near NE 145th Street, 220th Street SW, and the Lynnwood Transit Center. With the reconstruction of the NE 130th Street interchange and grade separating the northbound off-ramp from I-5 to 5th Avenue NE, the Preferred Alternative would remove an existing conflict point.

Multiple CALs are near the NE 145th Street Station. These include the northbound I-5 off-ramp to 5th Avenue NE, NE 145th Street at 5th Avenue NE, northbound I-5 on-ramp from 5th Avenue NE, and the southbound I-5 ramp terminal at NE 145th Street. The Preferred Alternative would improve safety for geometric modifications and access changes with a new signal at the I-5 northbound on-ramp at 5th Avenue NE. Other light rail alternatives with a NE 145th Street Station could also improve safety near this interchange because they would add a signal at the on-ramp.

Two CALs are near 220th Street SW, with one location near the proposed 220th Street SW Station in the Preferred Alternative with options. The intersection of 220th Street SW at 66th Avenue West is signalized and could experience an increase in potential conflicts between travel modes with a proposed station and park-and-ride at this location under Alternative B2A and an option to the Preferred Alternative.

Multiple CALs are near the Lynnwood Transit Center. Five of the locations are along 196th Street SW and would have similar conditions with the No Build Alternative, the Preferred Alternative, and other light rail alternatives. The two CALs along 200th Street SW adjacent to the Lynnwood Transit Center Park-and-Ride at 48th Avenue West and 46th Avenue West would be affected by the Preferred Alternative and other light rail alternatives. These intersections could experience an increase in volumes by all modes.

3.3 Construction Impacts

Construction of the Preferred Alternative or other light rail alternatives would affect local and regional traffic operations. These impacts would include increased congestion, traffic diversions caused by temporary road closures and detours, increased truck traffic associated with construction activity, and temporary changes in I-5 operations and roadside characteristics that could affect safety. Impacts could also result from the intrusion of non-local traffic into residential areas as a result of temporary street closures and traffic detours, disruptions to vehicular and pedestrian access, and the temporary loss of on- or off-street parking.

As part of normal construction planning and permitting, Sound Transit, WSDOT, FHWA, and the Cities would work to minimize the duration and impact of lane closures and reductions by (a) maintaining the same number of travel lanes on roadways affected by the project, where practical, except for short-duration closures that would occur on nights and weekends; (b) establishing detour routes on nearby arterials for short-duration closures; (c) maintaining WSDOT traffic management systems—closed circuit television (CCTV) cameras and monitoring, ramp metering, data stations, and variable message signing; and (d) providing mitigation through supplemental WSDOT incident response team service and Transportation Demand Management strategies.

The project's construction along I-5, which includes crossing over the freeway under all alternatives north of the Mountlake Terrace Transit Center, would involve temporary changes to I-5 roadway operations. It would also introduce features affecting shoulders as well as the roadside environment. There would be temporary nighttime lane closures along I-5 in some locations to allow Sound Transit to place safety barriers between the edge of the pavement and adjacent construction zones. With some alternatives, potential shoulder reductions and narrowed lanes in some locations would reduce the availability of the shoulder refuge for breakdowns and incidents. Construction access to and from I-5 would be from on-ramps and off-ramps as opposed to directly from the mainline, thereby minimizing the effects construction vehicles would have on I-5 general purpose traffic. Portions of the alignment would have construction access from the local arterials and streets in lieu of or in addition to access from on- and off-ramps. However, freeway capacity would be reduced by varying degrees due to the construction activity, resulting in increased congestion with some alternatives. The potential loss of highway shoulders with some alternatives would also affect safety. A Maintenance of Traffic plan that addresses all travel modes will be prepared at final design for FHWA and WSDOT approval and implementation during construction. This plan would include detailed design drawings establishing all physical and operating characteristics for staging, access, lane or shoulder closures and transitions, hauling, traffic management, detours, lane modifications, and other construction zones or activities. The plan would incorporate

WSDOT's established guidance for best practices and methods to be applied during construction periods, many of which are focused on reducing congestion impacts and minimizing safety hazards. For example, typical measures include signage, traveler advisories, special lighting for work zones and travel lanes, scheduling work during lower volume travel times, detailed contractor requirements, a variety of traffic and travel demand management strategies, and procedures for any construction directly affecting the active roadway.

The Preferred Alternative and other light rail alternatives would have some impacts on traffic operations on I-5 during installation of the girders for the guideway bridges and for rebuilding the I-5 bridges. Construction impacts would involve nighttime closures in each direction of mainline I-5 and traffic detours where the guideway crosses the freeway. Vertical clearance would be maintained on I-5. Construction access points, closures, and changes in I-5 operations will require approval from FHWA and WSDOT.

Reconstruction of I-5 overcrossings and overcrossing closures during construction would require lane closures, or temporary full closures, and detours. All alternatives would require reconstruction of the pedestrian bridge over I-5 at NE 195th Street. Detours could have secondary impacts on general purpose traffic, bus transit, bicyclists, and pedestrians on other facilities. Strategic phasing or sequencing of overcrossing closures, coupled with other mitigation measures described in Section 3.6, Potential Mitigation Measures, would minimize the cumulative impacts of closures. Lane closures on overcrossings would not occur for more than one bridge at a time within a segment.

Generally, construction truck traffic traveling to station construction sites would use city streets. Appendix F, Conceptual Plans, shows the potential construction staging areas and truck haul routes. The highest number of truck trips are expected during peak earthwork operations and concrete delivery for both guideway and station construction. For at-grade construction, 4 to 12 trucks per hour are estimated from each work zone. For elevated guideway construction, peak truck trips are estimated at 4 to 8 trucks per hour for the concrete delivery. Multiple work zones may be used during peak operations that would result in higher total project peak truck trips on I-5; however, these trips would generally not overlap with each other on the same local streets. Segment A would generate from 12 to 36 truck trips per hour. Segment B and Segment C would generate from 8 to 24 truck trips per hour. The estimated number of truck trips on I-5 would be from 20 to 60 truck trips; however, the actual truck trips on any specific segment of I-5 would be based on the origin and destination of the truck as it travels to and from the work zone.

Typical construction activity for surface and elevated guideways and stations would occur on a 6-day-per-week work schedule. Limits on hours of construction could occur when street detours are involved and/or construction periods need to be

abbreviated to reduce impacts. Periodic nighttime and weekend construction could occur during demolition of I-5 overcrossings and placement of new bridge girders for overcrossings.

Parking for construction workers will be provided on site with access from city streets. The contractor will provide shuttle service when off-site parking is needed. Parking could occur on city streets where parking is unrestricted.

Some loss of parking spaces at park-and-ride lots could occur during construction but would be minimized with construction phasing and temporary parking. Temporary lost parking spaces at park-and-ride lots would shift demand to other park-and-rides or cause a change in mode of access for patrons.

The Preferred Alternative and other light rail alternatives may require utility relocations along the alignment and near the stations. Utility relocations may require temporary lane closures and traffic control plans to maintain property access and circulation.

Impacts on general purpose traffic, transit operations, nonmotorized travel, and parking are summarized for each segment below and in Table 3-26. Refer to the *Transportation Technical Report* for more details on general corridor-wide and segment-specific construction impacts for the Preferred Alternative and other light rail alternatives.

Segment A Alternatives

Construction of the Preferred Alternative and other light rail alternative alignments in Segment A would primarily be conducted from staging areas within the I-5 freeway/WSDOT right-of-way and city streets between Northgate and NE 145th Street. Barriers would be installed at the edge of the pavement to establish work zone areas for the contractor. The Preferred Alternative and other light rail alternatives within Segment A would involve rebuilding overpass bridges or ramps at one or more locations.

Overpass bridge or ramp reconstruction affecting I-5 is expected at NE 117th Street, NE 130th Street, and NE 185th Street, and could require closure of one lane in each direction of I-5 during nights and weekends. The Preferred Alternative and Alternatives A1, A5, and A10 would involve nighttime closures of I-5 in the vicinity of NE 130th Street for up to 1 month for one lane southbound and one lane northbound.

Local street construction activity could include nighttime closures, intermittent daytime closures, and lane closures in one direction. Depending upon the light rail alternative, local streets affected include 1st Avenue NE, NE 117th Street, 5th Avenue NE, NE 130th Street, NE 145th Street, NE 155th Street, NE 175th Street, and NE 185th Street. Options that include construction of an elevated guideway over vehicular traffic would require nighttime closures of the affected facility (i.e.,

street, ramps, or I-5). Table 3-26 summarizes the major roadway closures for Segments A, B, and C.

Bus operations and transit riders traveling on I-5 could be affected by the increase in delay that would result from increased congestion. Bus schedules could also be less reliable as congestion and delay increase. For the alternatives with lane closures of I-5, to replace bridges over the freeway, transit would have increased travel time impacts, although maintaining an HOV lane could reduce the impacts.

All alternatives would close parking at the NE 135th Street/5th Avenue NE park-and-ride, and several alternatives would also close the existing NE 145th Street park-and-ride.

There would be no impacts on nonmotorized traffic due to construction within the I-5 alignment. However, nonmotorized travel would be affected in the vicinity of station construction as well as from reconstruction of freeway overcrossings.

The movement of trucks carrying freight would be affected similarly to general purpose traffic.

On-street parking would be lost temporarily along reconstructed street segments that have on-street parking and along roadways adjacent to the guideway construction.

Construction activities associated with stations and the guideway route may reduce or restrict property access and the contractor would need to maintain access during construction.

Table 3-26. Summary of Construction Impacts

Alternative	Roadway Closure[a]			Construction Truck Traffic[c]	Parking Loss		Regional Bus Facilities	Multimodal Neighborhood Mobility[e]
	I-5 Mainline	I-5 Interchanges	Arterial/Local Streets[b]		Park-and-Ride Spaces[d]	On-street (Yes/No)		
Segment A								
Preferred Alternative	Partial (short), Nighttime[e]	Nighttime	Nighttime – Partial (long)	Low	46	Yes	Minor	Moderate
Alternative A1	Partial (short), Nighttime[f]	Nighttime	Nighttime – Partial (long)	Low	46	Yes	Minor	Moderate
Alternative A3	Nighttime	Nighttime	Nighttime	Low	46	Yes	Minor	Low
Alternative A5	Partial (short), Nighttime	Nighttime	Nighttime – Partial (long)	Low	46	Yes	Minor	Moderate
Alternative A7	Nighttime	Nighttime	Nighttime	Low	46	Yes	Minor	Low
Alternative A10	Partial (short), Nighttime	Nighttime	Nighttime – Partial (long)	Low	46	Yes	Minor	Moderate
Alternative A11	Nighttime	Nighttime	Nighttime	Low	46	Yes	Minor	Low
Segment B								
Preferred Alternative	Nighttime	Nighttime	Partial (short)	Low	225	No	3 to 6 months plus nighttime closure of transit ramps	Moderate[f]
Alternative B1	Nighttime	Nighttime	Nighttime	Low	225	No	3 to 6 months plus nighttime closure of transit ramps	Moderate[g]
Alternative B2A	Nighttime	Nighttime	Partial (short)	Low	225	No	3 to 6 months plus nighttime closure of transit ramps	Moderate[g]
Alternative B4	Partial (short)	Nighttime	Nighttime	Low	0	No	Permanently closed when construction starts	Low[g]

Table 3-26. Summary of Construction Impacts

Alternative	Roadway Closure[a]			Construction Truck Traffic[c]	Parking Loss		Regional Bus Facilities	Multimodal Neighborhood Mobility[e]
	I-5 Mainline	I-5 Interchanges	Arterial/Local Streets[b]		Park-and-Ride Spaces[d]	On-street (Yes/No)		
Segment C								
Preferred Alternative	Nighttime	Nighttime	Nighttime	Low	560	No	Nighttime closure, direct access ramp	Low[h]
Preferred Alternative—Option to add 400 parking spaces at Lynnwood Transit Center	Nighttime	Nighttime	Nighttime	Low	560	No	Nighttime closure, direct access ramp	Low[g]
Alternative C1	Nighttime	None	Nighttime	Low	250	No	Minor	Low[g]
Alternative C2	Nighttime	None	Nighttime	Low	560	No	Nighttime closure, direct access ramp	Low[g]
Alternative C3	Nighttime	Nighttime	Nighttime	Low	560	No	Nighttime closure, direct access ramp	Low[g]

[a] Partial road closure assumes one lane is closed to traffic. Short-term duration is 2 months or less cumulative total (including intermittent periods of little activity). Long-term duration is 2 months to 12 months cumulative total, with potentially intermittent periods of little activity.
[b] Local access will be maintained throughout construction.
[c] Peak truck traffic is 4 to 12 trucks per hour at construction sites.
[d] Loss of parking during construction. Additional detail and potential mitigation, if provided, is in the Transportation Technical Report.
[e] Neighborhood mobility impacts include local transit route impacts and access to transit, pedestrian and bicycle mobility, traffic impacts due to construction, and neighborhood intrusion due to construction activities and parking.
[f] Nighttime periodic closures for the placement of the bridge girders.
[g] Moderate due to 6-month closure of NE 195th Street pedestrian/bicycle bridge over I-5.
[h] Detours required of Interurban Trail.

Segment B Alternatives

All light rail alternatives within Segment B would have construction adjacent to the east side of I-5 between NE 195th Street and the SR 104 interchange ramp. Construction would occur within the I-5/WSDOT right-of-way. Concrete barriers would be installed to define the work zone along the edge of the pavement. Construction access in this segment would primarily occur from local streets, the Mountlake Terrace Park-and-Ride, and the SR 104 interchange ramps.

Construction through the SR 104 interchange area would include construction work within the cloverleaf interchange. This activity is expected to have some impacts on traffic operations due to proximity of the construction near the interchange ramps. The ramps would also be closed periodically at night during construction of the guideway as it crosses over the ramps.

The Preferred Alternative and Alternatives B1 and B2A would require minor reconstruction of 236th Street SW along the curb/sidewalk area near the station. This would require short and periodic lane restrictions managed by flaggers.

North of the Mountlake Terrace Station, each alternative would require nighttime closures of I-5 at the overcrossings to install girders and construct the guideway bridges. Detours to local streets would be planned for these nighttime closures. For all alternatives, median or west-side construction would require staging and possible lane closures or nighttime full closures on cross streets such as 212th Street SW under I-5. For Alternative B2A and the Preferred Alternative, lane restrictions or partial closures could also affect 60th Avenue West.

Bus operations and transit riders traveling on I-5 could be affected by increased congestion resulting from construction activity adjacent to I-5 on the east side (south of the Mountlake Terrace Transit Center). There would be short-term closures (6 to 9 months plus nighttime closures) of the direct access ramps to the freeway station with the Preferred Alternative and Alternatives B1 and B2A to construct the alignment within the median north of the freeway station. Alternative B4 would permanently close the direct access ramps at the beginning of construction. With the closure of the freeway bus ramps to the Mountlake Terrace Freeway Station, buses may be rerouted to the park-and-ride, increasing travel time. However, some buses could remain on I-5 and skip the Mountlake Terrace Freeway Station.

The Preferred Alternative and all other light rail alternatives would require replacement of the NE 195th Street pedestrian bridge over I-5. The reconstruction of the NE 185th Street overcrossing or approach, located approximately 0.5 mile south of the NE 195th Street pedestrian bridge, would need to be completed at a different time than when the NE 195th Street pedestrian bridge is closed to maintain nonmotorized access across I-5 in this area.

For the Preferred Alternative and Alternatives B1 and B2A, part or all of the surface lot could be closed, reducing parking spaces during construction. No on-street parking spaces would be lost due to construction in Segment B.

Segment C Alternatives

For all alternatives, the elevated guideway in the I-5 median would require shoulder and possibly lane width reductions along both northbound and southbound I-5 to provide the median work zone. To cross over the southbound lanes of I-5, the elevated guideway would have a multi-foundation support system (using straddle bents); as a result, nighttime closures of southbound I-5 lanes would be needed. Nighttime closures on I-5 would also require detours onto surface streets. Temporary closures would also be necessary where the guideway crosses over local streets: 208th Street SW, 206th Street SW, 204th Street SW, 44th Avenue NE and its on-ramp, and the Interurban Trail.

Construction phasing and temporary parking would be used to minimize loss of parking at the Lynnwood Park-and-Ride. A loss of parking spaces would shift demand to other park-and-rides, cause a shift in mode of access, or increase the potential for transit patrons to park in other locations in the vicinity. Several large park-and-ride lots with capacity are located along I-5 north of the Lynnwood Park-and-Ride and could either capture the users upstream or result in some drivers traveling north to access transit.

There is currently no on-street parking that would be affected by the Segment C alignments; therefore, no on-street parking impacts are anticipated during construction.

3.4 Indirect Impacts

The completion of the Lynnwood Link Extension would result in fast and reliable rail service. Light rail service would help facilitate potential increases in residential and employment uses around the stations. This could lead to changes in regional and local travel patterns, as trips both to and from these areas increase for all modes, affecting transit, freeway and local traffic volumes, parking demand, and nonmotorized users. The light rail extension could also affect ridership on other transit service in the corridor, such as bus rapid transit service in the SR 99 corridor, where longer distance trips could decrease as some riders shift to light rail, and shorter trips could increase as more riders use other transit service to access light rail. Other changes in transit service in the project corridor in response to the light rail extension that are not yet planned or anticipated could also result in shifts in ridership. These could include the potential for Community Transit, Sound Transit, and King County Metro to redeploy and/or reinvest in bus service that is replaced by light rail. Also, ridership on the Sounder North commuter rail service could be

affected if some riders choose to shift from commuter rail to the Lynnwood Link Extension.

3.5 Cumulative Impacts

The future transportation impacts discussed in Section 3.2, Long-Term Impacts, were based on the results of traffic and ridership modeling that incorporated past, present, funded, and approved future actions, as well as projected growth that would generate development in the region.

Sound Transit is evaluating potential sites for an OMSF, as described in Chapter 2. One of the sites under consideration is located in Lynnwood (Segment C) north of I-5 and east of 52nd Avenue West/Cedar Valley Road. However, the transportation effects of the OMSF would be limited. The light rail trains would enter and leave the facility via a grade-separated dedicated light rail guideway. While employees, service vehicles, and shipments would arrive using local streets, the traffic is not expected to change conditions because the facility would occupy an area that is already largely developed with office and light industrial uses, and trips related to the displaced facilities would no longer occur. There would be no notable difference in the transportation effects of the OMSF related to Segment C alternatives—all of which have stations and park-and-rides that primarily would be accessed using different streets than 52nd Avenue West, which would be the street access point for the OMSF Lynnwood site alternative. In July 2014, the Sound Transit Board identified a Bellevue site as the Preferred Alternative. A final decision on the OMSF site will be made after publication of that project's Final EIS.

The Edmonds School District owns the property being considered for the Lynnwood site alternative for the operations and maintenance facility; the District has a master plan to develop the site for a support services center. This center will include administrative functions and an operations base with storage, maintenance, and fueling for the Edmonds' school bus fleet. If developed, the services center could increase traffic volumes along 52nd Avenue West, including during the morning peak period and in afternoons when the school buses are deployed. However, this added volume would not notably change the traffic impacts or mitigation measures of the Lynnwood Link Extension, which are largely focused on access points to the Lynnwood Park-and-Ride and station.

Sound Transit has started construction of the Northgate Link Extension, which would extend light rail from the University of Washington to Northgate. While this project is scheduled to be completed and in operation prior to completion of the Lynnwood Link Extension, some construction periods would likely overlap. To address this overlap with potential traffic construction impacts in the Northgate Mall area. Maintenance of Traffic plans for the two projects would be coordinated. Additionally, King County is planning to construct high-density transit-oriented

development adjacent to the planned Northgate light rail station. This development may be under construction at the same time as the Lynnwood Link Extension, potentially creating additional construction-related impacts in the area. Construction of this development will need to be coordinated with construction of the light rail extensions in order to minimize overall impacts.

Other unfunded regional and local transportation projects and development projects could have localized effects on transit ridership and travel patterns within the project area, including traffic operations near the proposed stations. However, implementation of potential plans such as new, managed, or tolled lanes in the I-5 corridor could alter transportation conditions anticipated for the No Build Alternative and the light rail alternatives; in general, these plans would be more likely to increase the use of transit. Otherwise, the transportation conditions would remain similar to those already described, with no material cumulative effects.

3.6 Potential Mitigation Measures

The following sections discuss measures Sound Transit would take to mitigate the impacts of the light rail alternatives. They also describe measures that Sound Transit proposes to take but which require the agreement of other parties. For instance, Sound Transit has identified certain intersection improvements, traffic management, safety, and parking strategies to mitigate project-related impacts, but the agency does not have the sole authority to make those improvements when the facilities are owned and managed by others. Others may also have alternative plans or projects to address project future conditions with or without the project. In these cases, Sound Transit would coordinate with these other agencies and jurisdictions to further define and implement improvements to mitigate the Lynnwood Link Extension's impacts.

3.6.1 Regional Travel

Completion of the Lynnwood Link Extension would not require mitigation for regional travel because highways and arterials are not expected to experience adverse changes in operations.

3.6.2 Transit

Mitigation for transit service would not be required because the project would improve the regional transit system and, by freeing up existing bus service resources, may allow King County Metro's and Community Transit's integration plans to provide coordinated bus service with the light rail system. To mitigate the temporary loss of park-and-ride spaces, Sound Transit would coordinate with local jurisdictions, transit providers, FHWA, and WSDOT to develop and implement plans for replacement parking and alternative access measures.

3.6.3 Freeway Operations

No mitigation would be necessary along the I-5 mainline. The Preferred Alternative and other light rail alternatives would have similar peak hour volumes and freeway operations along the I-5 mainline and ramps as the No Build Alternative. For I-5 near the NE 145th Street interchange, the intersection and arterial improvements already included in the project design (or offered in mitigation for Alternative A10) would result in the same or better conditions than would occur with the No Build Alternative; therefore no further mitigation is needed.

3.6.4 Arterials and Local Streets

For impacts on arterials and local streets, mitigation is potentially required at intersections where the intersection LOS with the light rail alternatives, compared with the No Build Alternative, would degrade to levels that do not meet jurisdictional LOS standards. For locations that would operate below LOS standards with the No Build Alternative in forecast year 2035, improvements were assumed to be needed if the light rail alternatives result in substantial increases in delays compared with the No Build Alternative. Potential mitigation measures for improvements at intersections are described below.

To mitigate intersections operating below local standards due to the project, or notably below No Build conditions that are already below local standards, Sound Transit would provide these improvements or other improvements as agreed to by the local jurisdiction. The intersection improvements would improve the AM and PM peak hour intersection delay to meet LOS standards, or for intersections that would be below standards with the No Build Alternative, to achieve the same level of service or better. In lieu of constructing the improvement proposed, Sound Transit could instead contribute to a local jurisdiction's project to improve intersection performance where the No Build Alternative would already be below standards, as agreed to with local jurisdictions.

Segment A

In Segment A, several intersections in the cities of Seattle and Shoreline could potentially require improvements to adjust for additional trips and changes in travel patterns to and from the proposed light rail stations. Tables 3-27 and 3-28 summarize the improvements Sound Transit proposes to bring intersection operations to acceptable levels. Intersection LOS results without the potential mitigation improvements are summarized in Tables 3-15 and 3-16.

Table 3-27. Forecast Year 2035 PM Peak Hour Intersection LOS with Potential Mitigation Improvements—Segment A

Nearest Station/ Intersection	LOS Standard	Alternative									Potential Improvements
		No Build	Preferred Alternative	Preferred Alternative + Options	A1	A3	A5	A7	A10	A11	
NE 145th/NE 155th Street Station

Notes:
[a] Intersection operations are improved based on mitigation at nearby or adjacent intersections. Mitigation is not proposed at this individual intersection.
* Location not analyzed for specific alternative. Intersection would be expected to operate similar to No Build Alternative.
LOS = level of service

Segment B

In Segment B, the project would not cause intersection impacts requiring mitigation.

Segment C

In Segment C, four intersections in Lynnwood could potentially require improvements to adjust for additional trips and changes in travel patterns to and from the proposed light rail stations. Tables 3-29 and 3-30 summarize the potential improvements Sound Transit proposes to bring intersection operations to acceptable levels in the PM and AM peak hours. Intersection LOS results without the potential mitigation improvements are in Tables 3-18 and 3-19.

Table 3-29. Forecast Year 2035 PM Peak Hour Intersection LOS with Potential Mitigation Improvements—Segment C

200th Street SW and 44th Avenue West	E	E	E	D	D	D	D	Preferred Alternative + Options, C1, C2, C3 – Add a second northbound left-turn lane and extend the eastbound right-turn pocket back to the P&R driveway
200th Street SW and 50th Avenue West	D	C	C[a]	C	C	C	C	Preferred Alternative + Options, C1, C2, C3 – Add overlap phase to northbound right-turn movement
200th Street SW and 48th Avenue West	D	C	D	D	D	D	D	Preferred Alternative, Preferred Alternative + Options – Add an eastbound right-turn pocket. Preferred Alternative + Options – Add a southbound right-turn pocket

Notes:
[a] Intersection operations are improved based on mitigation at nearby or adjacent intersections. Mitigation is not proposed at this individual intersection.
LOS = level of service, P&R = park-and-ride

3.6.5 Property Access and Local Circulation

In areas where property access and local circulation would be modified by the project, Sound Transit would work with local jurisdictions to develop and implement plans to maintain safe and effective access and circulation. In areas near modified interchanges, FHWA and WSDOT would also be involved.

To discourage cut-through traffic that may occur on residential streets in station areas, Sound Transit would work with local jurisdictions to define and implement appropriate neighborhood traffic controls.

3.6.6 Nonmotorized Facilities

The Lynnwood Link Extension alternatives would have no impact on non-motorized facilities; therefore, no mitigation would be required.

3.6.7 Freight Mobility and Access

The Lynnwood Link Extension would not require mitigation during operation to improve freight mobility and access because truck routes would be maintained and mobility would be maintained or improved with the project.

3.6.8 Parking

Where the project would remove off-street private parking spaces, Sound Transit would work with property owners to provide compensation or replacement parking.

To discourage transit patrons from parking outside of designated park-and-ride facilities, Sound Transit would work with local jurisdictions to evaluate and, if necessary, implement hide-and-ride mitigation. Sound Transit would inventory on-street parking around each station before and after the start of light rail revenue service, and would then work with the local jurisdictions to determine where mitigation measures would be needed. Potential parking control measures include parking meters, restricted parking signage, passenger and truck load zones, and residential parking zone programs.

Sound Transit would be responsible for the cost of installing the signage or other parking controls for 1 year after the light rail extension begins operation. The local jurisdiction would be responsible for monitoring, enforcing, and maintaining the parking controls.

3.6.9 Safety

To address potential safety concerns related to the placement of project structures in the I-5 right-of-way, Sound Transit will coordinate with FHWA and WSDOT during final design and will secure highway-related design approvals before construction.

3.6.10 Construction

Transit

Construction would affect the existing 5th Avenue NE/NE 133rd, North Jackson Park, Mountlake Terrace Transit Center, and Lynnwood Transit Center park-and-ride lots. Mitigation measures would include the following, as appropriate, or other measures developed in coordination with transit agencies:

- Implement service increases or other measures to encourage transit trips that do not require automobile access.
- Redirect transit riders who use these locations to nearby park-and-ride lots.
- Develop temporary parking for transit riders to use during construction.
- Use construction phasing strategies to build new park-and-ride spaces before the loss of existing spaces.
- Lease parking lots and/or new parking areas near the closed park-and-ride lots.

During construction, Sound Transit would mitigate partial closures of the Mountlake Terrace Transit Center and Lynnwood Transit Center. Transit service mitigation would include the following, as appropriate, or other measures developed in coordination with transit agencies and local jurisdictions:

- Relocate transit stops to adjacent streets.
- Provide a temporary transit center at a nearby off-street location.
- Revise transit services (including temporary service between Mountlake Terrace and destinations in King County due to temporary closure of the Mountlake Terrace Freeway Station).

Transit service mitigation measures for partial or full closures of streets would include rerouting of buses, where appropriate, to maintain transit service. Sound Transit would coordinate with King County Metro, Community Transit, and private transit service providers to minimize construction impacts and disruptions to bus facilities and services. Sound Transit would coordinate with these providers to inform passengers about changes with measures such as signage at existing transit stops and using website information, rider information systems, emails, and agency mailing lists.

Freeway Operations and Safety

As part of the WSDOT and FHWA approval process for construction within the I-5 right-of-way, and to minimize safety and operational impacts during construction, Sound Transit would collaborate with WSDOT and FHWA to develop and

implement the project's Maintenance of Traffic Plan. Sound Transit would coordinate construction with incident management, construction staging, and traffic control in places where the light rail construction would affect freeway traffic or involve changes to the roadside environment. Sound Transit would also coordinate with WSDOT to disseminate construction closure information to the public as needed.

Arterials and Local Streets

The adverse transportation impacts that would occur during construction include temporary lane or roadway closures during peak hours, temporary increases in truck traffic, and temporary loss of parking in some construction staging areas. Sound Transit would develop and implement detailed construction mitigation plans in close coordination with local jurisdictions and WSDOT during the final design and permitting phases of the project. Sound Transit would:

- Develop the Maintenance of Traffic Plan to conform to the *Manual on Uniform Traffic Control Devices* and jurisdictional agency requirements for traffic control.
- Use lighted or reflective signage to direct drivers to truck haul routes to ensure visibility during nighttime work hours.
- Use temporary reflective truck prohibition signs on streets with a high likelihood of cut-through truck traffic.
- Communicate public information about construction activities through tools such as print, radio, posted signs, Web sites, email, and direct communication with other agencies and affected parties; ongoing communications would update interested parties regarding street or freeway lane closures, detours, hours of construction, business access, and parking impacts.
- Coordinate access closures with affected businesses and residents. If access closures are required, property access to residences and businesses would be maintained to the extent possible. If access to the property cannot be maintained, the specific construction activity would be reviewed to determine if it could occur during non-business hours, or if the parking spaces and users of this access (for example, deliveries) could be provided at an alternative location.
- Require the contractor to provide parking areas for construction workers, where necessary. This may include remote parking with shuttle service to and from the construction site if sufficient on-site parking cannot be provided.
- Post signs prior to construction in areas where surface construction activities would affect access to surrounding businesses.

- Schedule traffic lane closures and high volumes of construction truck traffic during off-peak hours.
- Evaluate and limit concurrent construction to minimize construction impacts.
- Cover potholes and open trenches, where possible, and use protective barriers to protect drivers from trenches remaining open.
- Provide temporary parking to mitigate loss due to construction staging or work activities, as appropriate.

Parking

In locations where Sound Transit would remove off-street private parking spaces, Sound Transit would provide property owners with compensation or replacement parking.

Nonmotorized Facilities

Sound Transit would minimize potential impacts on pedestrian and bicycle facilities by providing detour routes through construction areas. Sound Transit would also notify the public of these changes. Multi-use trails that might be affected by construction would generally be kept open. Detours would be provided when trails are closed, unless they are closed for short durations or in areas where a detour option is not feasible. Closures or restrictions of I-5 overcrossings would be sequenced to maintain travel across I-5 at the next nearest crossing.

Freight Mobility and Access

To minimize delays and restricted access for business deliveries on arterials and local streets, Sound Transit would work with local jurisdictions to develop and implement construction traffic control plans. The agency also would coordinate with affected businesses before and during the construction period to maintain business access as much as possible.

For construction associated with I-5, Sound Transit would coordinate with freight stakeholder groups by providing construction information to WSDOT for use in the state's freight notification system. Sound Transit would provide information in a format acceptable to WSDOT.

Cumulative Construction Impacts

To mitigate cumulative impacts of potentially overlapping construction periods in the Northgate area, Sound Transit would coordinate the construction activities of the Northgate Link and Lynnwood Link extensions, and would also coordinate with the King County Metro transit-oriented development project.

4 ENVIRONMENTAL IMPACTS AND MITIGATION

This chapter discusses the affected environment and environmental consequences for the environmental topics listed at the right. Each section describes the resource study area, applicable laws and regulations with which the project would comply, and the effects of each alternative considered in this Final EIS.

Environmental Topics in Chapter 4

4.1 Acquisitions, Displacements, and Relocations
4.2 Land Use
4.3 Economics
4.4 Social Impacts, Community Facilities, and Neighborhoods
4.5 Visual and Aesthetic Resources
4.6 Air Quality and Greenhouse Gases
4.7 Noise and Vibration
4.8 Ecosystem Resources
4.9 Water Resources
4.10 Energy Impacts
4.11 Geology and Soils
4.12 Hazardous Materials
4.13 Electromagnetic Fields
4.14 Public Services, Safety and Security
4.15 Utilities
4.16 Cultural, Archaeological, and Historic Resources
4.17 Parks and Recreational Resources
4.18 Section 4(f) and Section 6(f) Evaluation

NEPA and SEPA regulations require that an EIS disclose direct, indirect, and cumulative impacts (also called effects) of a proposed action on the environment. *Direct impacts* are caused by the action and occur at the same time and place (40 Code of Federal Regulations [CFR] 1508.8(a)). *Indirect impacts* (also called secondary impacts) are caused by the action and are later in time or farther removed in distance but still are reasonably foreseeable (40 CFR 1508.8(b)), such as changes in land use patterns and related effects on air quality. Impacts can be either temporary (short term), such as construction impacts, or permanent (long term), such as with property conversion to a transportation use, or impacts due to project operation. For this EIS, the impacts analysis for each resource is divided into long-term impacts and short-term construction impacts.

A *cumulative impact* results from the proposed action's incremental impact when added to those of other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions (40 CFR 1508.7). Cumulative impacts are considered because the public and government agencies need to evaluate a proposed action and its alternatives in a broad perspective, including how the project might interact with impacts that persist from past actions, with present-day activities, and with other projects that are planned but have not been built yet (reasonably foreseeable future actions); see Appendix H, Other Projects and Actions Considered in Cumulative Effects, for a list of the projects considered. The study area for the cumulative impact analysis is generally a combination of the study areas defined in Chapter 3 for transportation facilities and in Chapter 4 for the various environmental resources. The

exceptions are ecosystem-related resources, where expanded study areas are used to capture potential impacts to the functions of larger ecosystems.

This chapter discusses the proposed project's direct, indirect, and cumulative impacts on each resource analyzed. Mitigation measures are proposed in the following sections for all alternatives when potential impacts could not be avoided. The set of potential mitigation measures for the Preferred Alternative is presented in Appendix N, Mitigation Plan. The FTA Record of Decision for the project will confirm the mitigation commitments of the project.

4.1 Acquisitions, Displacements, and Relocations

The Lynnwood Link Extension would acquire public and private property for the light rail right-of-way and other facilities. The project also would displace and relocate some residential, commercial, and public uses. The potential property acquisitions are based on the conceptual plans Sound Transit developed for the light rail alternatives (see Appendix F, Conceptual Plans).

This section discusses two types of potential property acquisitions:

- **Partial acquisition**—Part of a parcel would be acquired, but the current use generally would not be displaced. In some instances, such as larger parcels that hold multiple uses, a business or residential unit on a parcel could be displaced, but most uses would remain.
- **Full acquisition**—The full parcel would be acquired and the current use would be displaced. Full acquisitions include parcels that might not be fully needed for the project but would be affected to the extent that current uses would be substantially impaired (e.g., loss of parking or access).

The acquisition and displacement data presented in this section are estimates based on conceptual designs for the light rail alternatives. Final determinations of the property needs for the project, including acquisitions and displacements, will be based on the project's final design after Sound Transit completes the EIS process, selects the alternative to be built, and develops final engineering and design plans. The types of acquisitions discussed in this section provide information useful for comparing alternatives. The estimates of the displaced land uses reflect the conditions at the time the analysis was conducted. Because property uses change, the number and/or type of displacements could vary between what is disclosed in the EIS and what would actually be required. If there is surplus property (property no longer needed for construction or operation of the project) once the project is complete, Sound Transit would likely sell or transfer the surplus property.

In addition to property acquisitions, the project would require temporary construction easements, permanent easements, and the permanent use of public right-of-way owned

by WSDOT and local jurisdictions. The specific areas of the construction easements are not included in the data presented here, although the impacts of these easements are considered in the analysis. Most construction staging areas would be located within areas needed for the proposed project's construction, including properties purchased for the light rail right-of-way.

According to 23 CFR 810 Part C, Making Highway Rights-of-Way Available for Mass Transit Projects, Sound Transit must submit an application to WSDOT to use the highway right-of-way. If WSDOT is amenable, WSDOT would then request FHWA to authorize it to make the right-of-way available for Sound Transit's use. The request to FHWA would be accompanied by evidence that the use of the right-of-way for light rail would not impair future highway improvements or the safety of highway users. FHWA would review the request in accordance with 23 CFR 710 and 810, and may authorize WSDOT to make the right-of-way available to Sound Transit if it is determined that:

> "(a) The evidence submitted by the State highway agency under Section 810.206 is satisfactory;
>
> (b) The public interest will be served thereby; and
>
> (c) The proposed action in urbanized areas is based on a continuing, comprehensive transportation planning process carried on in accordance with 23 U.S.C. 134 as described under 23 CFR Part 450, subpart A." (23 CFR 810.208)

In the areas where the light rail alternatives are proposed within the I-5 right-of-way, Sound Transit and WSDOT coordinated to define the potential limits to such use. The agencies' collaborative planning considered current conditions on the corridor, applicable design standards for highways and light rail, and WSDOT's ability to make future highway improvements. The planning for the project's right-of-way assumptions resulted in the *I-5 Light Rail Compatibility Report* (Sound Transit 2012), signed by both Sound Transit and WSDOT. The report's findings formed the basis for the conceptual engineering of the EIS alternatives. The estimated WSDOT right-of-way needed for the Lynnwood Link Extension is presented in Section 4.1.2, Long-Term Impacts. Ultimately, Sound Transit must secure FHWA's approval for use of the I-5 right-of-way.

Other impacts associated with acquisitions and displacements are discussed in Section 4.2, Land Use; Section 4.3, Economics; Section 4.4, Social Impacts, Community Facilities, and Neighborhoods; Section 4.16, Cultural, Archaeological, and Historic Resources; Section 4.17, Parks and Recreational Resources; and Section 4.18, Section 4(f) and Section 6(f) Evaluation.

The project would also affect properties by modifying access on some local streets. FHWA and WSDOT must review and approve any change to I-5 ramps or

interchanges, and this process could change the access requirements for streets adjacent to a freeway entrance or exit. If WSDOT and FHWA require more restricted road access in order to maintain safe and effective interchange operations, properties that completely lose their access could be acquired by Sound Transit. The proposed project will comply with the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. The Act and its amendments direct how federal agencies, or agencies receiving federal funding for a project, will compensate property owners or tenants who must relocate if displaced by the project. The project will also comply with Sound Transit's adopted Real Property Acquisition and Relocation Policy, Procedures, and Guidelines, and with Chapter 8.26 RCW, which establishes a uniform policy for relocation assistance for people displaced by public projects in Washington. Property acquisition will follow these laws and policies to ensure property owners and tenants are treated uniformly and fairly.

4.1.1 Affected Environment

The study area for the acquisitions, displacements, and relocations analysis includes the parcels that are within the areas where the light rail alignments, stations, related facilities, or mitigation require right-of-way. This land is heavily developed and contains residential, commercial, industrial, public, and vacant property. Most of the properties in Segments A and B are residential, while Segment C contains commercial, industrial, and public properties. Current and projected land uses adjacent to the light rail alternatives are discussed in Section 4.2, Land Use; estimates of changes in employment due to business displacements are provided in Section 4.3, Economics.

4.1.2 Long-Term Impacts

Sound Transit overlaid the proposed footprint for all the light rail alternatives over the parcel data from King and Snohomish counties to identify which parcels would be affected by each alternative, and to estimate the potential full and partial acquisitions and resulting displacements by the alternatives. Table 4.1-1 presents the estimated number of acquisitions and displacements for each alternative. Table 4.1-2 presents the estimated amount of WSDOT right-of-way Sound Transit would occupy for each light rail alternative. Further project design may change these estimates, and WSDOT and FHWA approvals may alter the amount of I-5 right-of-way that is used.

The tables and maps in Appendix I-4.1, Acquisitions, Displacements, and Relocations, identify the potentially affected properties by alternative. To estimate the number and types of uses affected, Sound Transit used tax assessor data from King and Snohomish counties and also conducted field surveys. During final design, Sound Transit would prepare detailed assessments of uses, underlying ownership, and the parties involved in displacements to support its Real Property Acquisition and Relocation Policy, Procedures, and Guidelines (see Section 4.1.7).

Table 4.1-1. Potential Property Acquisitions and Displacements

Alternative	Number of Affected Parcels	Residential – Single Family		Residential – Multifamily		Commercial and Industrial		Public and Institutional		Vacant Land		Total Full Acquisitions	Total Partial Acquisitions	Total Displacements	
		Full	Partial	Full	Partial	Full	Partial	Full	Partial	Full	Partial			Residential (units)	Businesses and Institutional

C3	15	0	1	0	0	1	10	1	2	0	0	2	13	0	1

[a] These numbers do not include the properties that could be affected if FHWA or WSDOT require interchange access modifications for the NE 130th Street Station or NE 145th Street Station.

[b] The total of displaced residential units includes individuals in rooming/boarding houses (49 displacements), which are counted under acquisitions as single-family parcels based on assessor records. The total also includes the displacement of the caretaker's house at the Seattle Latvian Evangelical Lutheran Church in Seattle and residential building at True Jesus Church in Shoreline.

[c] The total of displaced residential units includes 76 condominium units displaced by the one full multifamily residential property acquisition.

Source: Conceptual design right-of-way estimates.

No Build Alternative

No properties within the study area would be acquired with the No Build Alternative. No displacements or relocations would occur.

Segment A: Seattle to Shoreline

Within Segment A, Sound Transit would acquire property for right-of-way where the available WSDOT right-of-way is too narrow to completely accommodate the light rail project. In addition to land for the light rail guideway, Sound Transit would also need to acquire property for stations, stormwater facilities, ecosystems impact mitigation, street or highway modifications, relocated utilities, traction power substations, noise walls, and other project-related facilities.

Most of the properties adjacent to the Segment A alternatives are single-family residential. The alternatives in this segment would affect more residential properties than in other segments, and the majority of the potential full acquisitions is residential. Most of the affected properties contain single-family residences, but six contain rooming or boarding houses, which Sound Transit estimates would involve 49 individual residential displacements.

Alternatives A1, A5, and A10 in the Draft EIS would have occupied a Seattle city street that provided access for the Seattle Latvian Evangelical Lutheran Church, and the Draft EIS identified the church as a full acquisition. Since the publication of the Draft EIS, the alternatives were modified by redesigning the street, which maintains access to the church property. As a result, none of the Segment A alternatives would displace the church. However, two single-family residential displacements would occur as a result of the street redesign, in addition to a residential structure related to the church (the caretaker's house).

The Segment A alternatives would require similar numbers of acquisitions. The Preferred Alternative would have the highest number of full acquisitions, and most of them would be residential. Alternatives A3 and A11 would have the fewest full acquisitions of the Segment A alternatives because most of their alignments would be elevated (including their respective stations), reducing impacts on adjacent properties. Alternative A5 would have the most full acquisitions of the Segment A alternatives, including the most residential displacements, because it is mostly at-grade bordering residential areas, and its stations would also be in residential areas.

The Seattle Latvian Evangelical Lutheran Church and the True Jesus Church would be affected by the Preferred Alternative, as well as the other Segment A alternatives, but the churches would not be displaced. No commercial, industrial, or public land uses would be displaced in Segment A.

The Preferred Alternative includes an option that allows for the eventual construction of a station at NE 130th Street. Sound Transit does not expect the construction of this station to require more property than the Preferred Alternative with no station at this location. The Preferred Alternative also includes the NE 185th Street Station Shoreline Stadium Garage Option, which would place the parking garage on the current Shoreline Stadium parking lot. This would require Sound Transit to lease or buy a portion of this property from the Shoreline School District. With the Preferred Alternative, interchanges likely would be modified for the NE 145th Street Station, which would require limited access agreements for some of the adjacent properties. For the other light rail alternatives, the NE 130th Street and NE 145th Street interchanges might also be modified for stations. Alternatives A5, A7, A10, and A11 could affect additional residential properties if they are selected and their modifications approved by FHWA and WSDOT. The alternatives with the NE 145th Street Station Option 2 (A3, A10, and A11) could also have additional full acquisitions if access to the property is eliminated by interchange modifications. Figure I-4.1-2 in Appendix I-4.1 show the areas that could be affected.

Federally designated highway beautification areas are located adjacent to I-5 in this segment. Some of these designated areas could become project right-of-way. Potential visual impacts caused by the use of these beautification areas are discussed

in Section 4.5, Visual and Aesthetic Resources; any conversion of a beautification area would require replacement land along the I-5 corridor, which may be in addition to properties identified here.

Segment B: Shoreline to Mountlake Terrace

Much of the Preferred Alternative and the other Segment B alternative alignments are within the existing highway right-of-way; therefore, light rail in this segment would affect fewer parcels than in Segment A. The Preferred Alternative has fewer acquisitions compared to the Alternative B2 outlined in the Draft EIS primarily because it has modified the alignment north of 236th Street SW to be closer to I-5 after crossing to the west side of the freeway. It would still affect three single-family residential properties (instead of the five presented in the Draft EIS), near 212th Street SW.

The Segment B Preferred Alternative has an option for a 220th Street SW Station on the now vacant Edmonds School District property on the south side of the street. This option would acquire the Edmonds School District property and five residential properties to the south.

Alternatives B1 and B4 would not affect any residential properties and would only result in two full acquisitions. Alternative B2A would fully acquire five single-family residential properties.

Segment C: Mountlake Terrace to Lynnwood

The Preferred Alternative would not affect any residential properties, but it would impact four commercial properties, resulting in the displacement of nine businesses; one fully acquired parcel has six businesses on it. The Preferred Alternative would cross a portion of an Edmonds School District property, resulting in a partial impact to the property. It would cross a public parcel containing Scriber Creek and related wetlands, resulting in a partial impact to the property, but it would avoid Scriber Creek Park to the north. The Preferred Alternative also would cross a transmission line right-of-way owned by the Snohomish County Public Utilities District, which is used as part of the Interurban Trail; the crossing would be a partial impact to the property.

Alternative C1 would affect the most properties of any alternative in Segment C. It would acquire all of the Cedar Creek Condominium buildings, requiring 76 residential relocations. It would also fully acquire two office park properties, displacing 31 businesses, and it would acquire a strip of land from Scriber Creek Park.

Alternative C2 would displace three businesses and Alternative C3 would displace one business.

All Segment C alternatives would partially impact an Edmonds School District property, but to varying degrees. The Preferred Alternative would cross the eastern part of the property.

4.1.3 Construction Impacts

During construction, property will be needed in each segment for staging areas, construction access, and temporary construction easements. Most of these construction needs would be accommodated within property required for permanent rights-of-way, although some other properties would be needed. Many staging and access requirements could be fulfilled through temporary construction easements or leases, but some full acquisitions are still likely.

A temporary construction easement allows for temporary use of a property during construction. When construction is complete, the property is restored to its previous condition for the owner and the easement is terminated. Such easements would be necessary at various locations along the project corridor. The size of the easement would depend on the type of activity expected on the property and the type of land uses in the area; for example, a vacant property would provide an opportunity for a larger easement, whereas easements adjacent to developed property likely would be smaller to reduce or avoid impacts.

Off-site staging areas might be needed to stockpile excavated materials or to cast and store precast structural elements. These areas would be located close to work sites, when possible, to minimize the impact on local traffic.

The construction staging areas would primarily be adjacent to the proposed alignments. The project would use WSDOT right-of-way for construction staging where feasible and approved by FHWA and WSDOT, and could use other available lands on a temporary basis, including parts of city street rights-of-way.

As project design and construction planning are finalized, Sound Transit may identify the need for additional construction staging areas outside of the proposed project's right-of-way, requiring the acquisition of additional property. Contractors may also negotiate use of additional property directly with the property owner. Proposed staging areas are shown in Appendix F, Conceptual Plans.

4.1.4 Indirect Impacts

The project's property impacts resulting from acquisitions, displacements, and relocations would be direct. There could also be indirect impacts associated with the change in land use, as a property currently used for residential is converted to a transportation use. Acquired property could also accommodate transit-oriented developments, consistent with Sound Transit policy and local planning requirements. Sound Transit anticipates the project would fully acquire both the

Mountlake Terrace Transit Center and Lynnwood Transit Center and park-and-ride properties for this project. These properties would retain their transportation use, but they could also accommodate future transit-oriented developments. The potential indirect or secondary impacts due to transit-oriented development are discussed in more detail in Section 4.2.4, in the Land Use section of this Final EIS.

4.1.5 Cumulative Impacts

Other projects could result in additional property acquisitions and displacements in the vicinity of the Lynnwood Link Extension. Sound Transit's Northgate Link Extension from the University District to the Northgate Transit Center is acquiring property for permanent facilities and construction activities. Most of these acquisitions and easements are expected to be completed before the Lynnwood Link Extension begins construction, although in some areas early work for the Lynnwood Link Extension could use them as well. Sound Transit's Long-Range Plan also anticipates future projects to extend light rail north to Everett, which could affect properties to the north of the terminus for the Lynnwood Link Extension in Segment C. The properties that could be affected would differ by alternative in Segment C. The final design for the Lynnwood Link Extension, as well as the design for any future project, would also determine the properties potentially affected.

Additionally, Sound Transit is completing the environmental review for a separate project to develop an OMSF. One of the alternatives is in Lynnwood, on lands adjacent to the Segment C alternatives. If the Lynnwood site is developed for the maintenance facility, additional properties would be affected within the city, including the majority of the parcel owned by the Edmonds School District. In July 2014, the Sound Transit Board identified a site in Bellevue as the Preferred Alternative. The final decision on the location for the OMSF will be made after the publication of that project's Final EIS in 2015.

Otherwise, there are few sizable public or private projects in the project vicinity that would acquire properties and displace their uses; the King County Transit-Oriented Development at Thornton Place (Northgate) may be a project to note, but there are no specific development plans at this time. See Appendix H, Other Projects and Actions Considered in Cumulative Effects, for a list of other projects that could result in acquisitions and displacements in the vicinity of the Lynnwood Link Extension. Changes in property ownership due to other developments would be more likely to occur over time as market transactions take place.

4.1.6 Relocation Opportunities

To determine relocation opportunities in the project vicinity, Sound Transit researched market conditions for available residential and commercial real estate in the study area. As shown in Table 4.1-3, the research considered real estate markets within Shoreline, Mountlake Terrace, Lynnwood, and north Seattle; these areas offer the most likely relocation opportunities in the study area. Although property availability will change over time, the research indicates that there would be adequate opportunities for residents and businesses to successfully relocate within the general area, typically within the same city. Some affected properties with unique characteristics or uses (such as a property with school district uses) could prove more challenging to replace.

Table 4.1-3. Property Available for Relocation in the Study Area[a]

Type of Property	Buildings/Units	Total Square Feet[b]	Vacancy Rate[c]	Listings[d] (2014)
Apartment	31,291	—	3%	517
Single Family	86,326	—	—	456
Office	440	6,600,000	11%	33
Industrial	280	4,700,000	5%	14
Retail	1,120	16,800,000	4%	39
Hotel	36	1,400,000	—	0

[a] The study area is Shoreline, Mountlake Terrace, Lynnwood, and north Seattle (the southern boundary of north Seattle varies by market segment, and is variably the Ship Canal, NE 65th Street, or NE 85th Street).
[b] Square feet amounts rounded to nearest 1,000.
[c] Vacancy rate as of May 30, 2014, rounded to the nearest 1 percent.
[d] Number of listings as of May 30, 2014.
Sources: Costar, Dupre+Scott, NWMLS, 2014, Kidder Matthews.

The relocation of a business or residence is an inconvenience or hardship for those involved. Sound Transit would offer relocation assistance that includes compensation as well as supporting services that consider the unique needs of those being relocated, and this assistance can help reduce inconveniences or hardships. Finally, Sound Transit is required to satisfy federal requirements for residential relocation, which define a "comparable replacement dwelling" as any dwelling that is (A) decent, safe, and sanitary; (B) adequate in size to accommodate the occupants; (C) within the financial means of the displaced person; (D) functionally equivalent; (E) in an area not subject to unreasonable adverse environmental conditions; and (F) in a location generally not less desirable than the location of the displaced person's dwelling with respect to public utilities, facilities, services, and the displaced person's place of employment (42 United States Code [USC] 61).

Apartments

There are approximately 31,000 apartment units in the study area.[1] With the current vacancy rate at about 3 percent, there are about 517 available apartment units for rent along the project corridor. For displaced tenants, a sufficient supply of comparable relocation apartments is expected to be available in various locations and building types within the study area. Finding similar reasonably priced replacement property for some owners of properties with unique uses in the proximity of the displaced property may prove challenging. However, Sound Transit would provide relocation assistance and compensation; owners would be able to choose their replacement property, or they could take compensation entirely.

Single Family

There is a reasonable supply of comparable single-family homes available to meet the relocation needs of single-family home residents displaced by the project. While the local inventory for comparable homes can be limited, this does not alter Sound Transit's obligation to find replacement properties and to provide compensation and relocation assistance to ensure the properties are affordable for the displaced parties. The inventory of condominiums and townhouses is smaller, but it is also expected to be adequate for the project's relocation needs.

Office

A review of the market found sufficient office buildings available for sale each year to replace displaced buildings. A substantial amount of space is also available for lease each year to meet the needs of displaced office tenants. In addition, vacant land and underutilized properties are available for the construction of new office buildings, which can provide additional capacity.

Industrial

Adequate industrial space is available in the market to meet the needs of the few industrial building owners and tenants that would be displaced by the project. The industrial market in the study area is stable; however, the area is becoming increasingly urbanized and market forces will encourage industrial uses to give way to other uses over time. In the future, those seeking relocation opportunities for industrial space in the study area will have fewer choices.

[1] The increase in total unit count from the Draft EIS is due to a change in methodology, which included more apartment buildings in the inventory data.

Retail

Research suggests there is a substantial amount of retail space for sale and for lease to meet the relocation needs of retailers displaced by the project. Retail space users often have specific location requirements; therefore, Sound Transit would perform a case-by-case assessment to understand how the available inventory could meet the displaced retailer's needs.

Hotels

Displaced hotel property owners would have to find a property that is for sale or a substitute site on which to construct a new hotel. The study area has 36 hotels, generally located along the I-5 and SR 99 corridors. Hotels do come up for sale, but the likelihood is probably low of finding an available property matching the location requirements and physical characteristics of the displaced property. New development sites exist and may provide the best opportunity to replace an existing hotel.

4.1.7 Sound Transit Real Property Acquisition and Relocation Policy, Procedures, and Guidelines Summary

Sound Transit notified property owners whose property would be directly affected by any of the alternatives, but acquisitions of property would begin only after the Final EIS and NEPA/SEPA processes are complete. The agency is available to answer questions and provide additional information about compensation and relocation assistance services, payments, reimbursement eligibility, and the timing of the process. Sound Transit's relocation assistance and advisory services would include, but not be limited to, measures, facilities, or services that might be necessary or appropriate to determine the relocation needs and preferences of each household, business, and organization to be displaced. The agency also would provide current information on the availability, purchase prices, and rental costs of comparable replacement properties.

Sound Transit would work closely and proactively with residents and businesses to help them plan ahead for relocation, assist in finding new homes or sites, and help to solve problems that might occur. While the ultimate choice of a relocation site would be decided by the affected resident or business, the agency would help investigate possible locations, including nearby properties. Sound Transit uses interpreters to help those with limited English proficiency understand their choices and options.

Owners would not be required to relocate until they have been paid the agreed purchase price or until an amount equal to Sound Transit's estimate of just compensation has been deposited with the court. Businesses and tenants would

not be required to move operations or relocate without receiving at least 90 days written notice.

A public agency must pay "just compensation" to property owners for land and improvements acquired for public purposes. "Just compensation" must not be less than the fair market value of the property acquired, including damages or benefits to the remaining property in the case of partial acquisitions.

Sound Transit would pay for normal expenses of sale, including escrow fees, title insurance, prepayment penalties, mortgage release fees, recording fees, and typical costs incurred as part of conveying title.

Other benefits and compensation might include payment of residential moving expenses and replacement housing payments, non-residential moving expenses, and reestablishment expenses. Sound Transit's *Business and Residential Acquisition and Relocation* handbooks outline compensation and acquisition procedures in detail.

If Sound Transit recognizes special circumstances, proactive help would be made available to help resolve problems.

4.1.8 Mitigation Measures

For property that is permanently or temporarily acquired for this project, Sound Transit would compensate property owners affected by the project, according to the provisions specified in Sound Transit's Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines; the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended; and the state of Washington's relocation and property acquisition law and regulations. Benefits would vary by property depending on the level of impact, available relocation options, and other factors. The primary mitigation for acquisitions and displacements would be payment of just compensation and relocation assistance.

For temporary construction easements, in addition to just compensation, the property would be restored to its previous condition for the owner and/or another type of compensation would be employed as outlined during the easement's negotiation process.

If federally designated highway beautification areas are converted for project rights-of-way, Sound Transit will mitigate for these impacts by providing property along I-5 to replace the converted beautification areas, or with other measures as agreed by WSDOT and FHWA.

4.2 Land Use

This section discusses existing land uses and zoning (i.e., allowable land uses), describes changes in land use that could occur as a result of the Lynnwood Link Extension alternatives, and evaluates the consistency of the project with local and regional planning policies.

The land use study area for this EIS consists of the parcels immediately adjacent to the proposed alternative routes and within a 0.50-mile radius around the stations.

For this evaluation, the project was evaluated for land use compatibility and conformance with existing land use policies of regional and state plans, and locally adopted plans listed in Table 4.2-1. Appendix I-4.2, Land Use Plan Consistency Analysis, discusses the regional, state, and local land use plans and policies pertaining to the study area.

4.2.1 Affected Environment

The project corridor is located within King and Snohomish counties, and the alternatives would have stations in four cities (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Existing land uses include single-family and multifamily residential, commercial (retail, services, and office uses), institutional, light industrial, and transportation uses. Many recreational and public open space uses are in the study area. Section 4.17, Parks and Recreational Resources, provides more information. The project would not affect any farm land.

The Growth Management Act (GMA) requires state and local governments to identify and protect critical areas and natural resource lands, designate urban growth areas, and prepare comprehensive plans and implement them through capital investments and development regulations. The project is within the urban growth boundaries identified by King and Snohomish counties.

PSRC's *VISION 2040*, adopted in 2009, articulates the region's integrated long-range growth management strategy. Its strategy is to guide growth, concentrate new employment in urban centers, and link the centers with a high-quality multimodal transportation system. Urban centers are the hallmark of *VISION 2040* and its regional growth strategy. Northgate and Lynnwood have been designated as regional growth centers for housing, employment, and public services growth, as well as for multimodal transportation connections and regional funding.

The following subsections describe existing land uses for each project segment. Future allowable land uses are presented as generalized zoning in Figures 4.2-1a and 4.2-1b. Existing land use and future allowable land uses are based on information from comprehensive plans and planning documents for the cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood. Section 4.3, Economics, includes information on projected residential units and business employment within 0.50 mile of the proposed stations.

Segment A: Seattle to Shoreline

Segment A begins in the Northgate area. Northgate consists of a regional shopping center and a mix of other urban uses, such as multifamily residential and commercial usage. The Northgate Apartments multifamily residential complex is just north of the shopping center. North of North 115th Street, the area is predominantly single-family residential. Several large public parks and open spaces are in Segment A, as well as several small commercial areas primarily east of I-5, generally along 15th Avenue NE.

Other larger parcels or unique uses in Segment A include the Lakeside School, the Seattle Latvian Evangelical Lutheran Church, the Shoreline Fire Station, the King County solid waste transfer facility, the King County Metro bus base, and Shoreline Center, which is part of a complex owned and operated by the Shoreline School District.

Much of the area along the alignment is otherwise residential, with little commercial uses. While the City of Seattle's policy is to consider transit-oriented development in areas with transit investments, it currently does not have specific plans or policies supporting transit-oriented development at the proposed NE 130th Street or NE 145th Street station locations.

Figure 4.2-1b
Generalized Zoning
Segments B and C

The City of Shoreline's *Comprehensive Plan*, Land Use Element, provides policy direction for the City as it coordinates with Sound Transit on the proposed project and describes how land uses around station areas could help foster vibrant, livable, and transit-oriented communities. The land use policies are to guide land use regulations for station areas at NE 145th Street and NE 185th Street, including transit-supportive developments with residential components mixed with complementary commercial and office uses. In 2014, Shoreline prepared a subarea plan for the NE 185th Street Station area to help further define development policies for that area. A similar effort is underway for the NE 145th Street Station area. Comprehensive plan amendments for both plans and potential zoning changes are anticipated to be adopted in 2015.

Segment B: Shoreline to Mountlake Terrace

Most of Segment B consists of single-family residential communities, with interspersed areas of multifamily residential, commercial, recreational, and open space uses. The Shoreline School District has properties along the west side of I-5 between NE 185th Street and NE 191st Street, straddling Segments A and B, as well as along the east side of I-5 between NE 191st Street and NE 194th Street. Adjacent to the Shoreline School District property to the east of I-5 is a park and the single-family residential neighborhood along NE 194th Street. A pedestrian/bicycle overpass at NE 195th Street links neighborhoods east and west of I-5. The SR 104/I-5 interchange area east of I-5 consists of a shopping center and mixed multifamily residential and commercial uses.

The Mountlake Terrace Transit Center is east of I-5 at 236th Street SW. The Mountlake Terrace Town Center is along the 236th Street SW corridor to the east, and consists of a mix of uses such as multifamily residential and commercial. A park is located near the transit center, and single-family residences surround much of the area. Businesses surrounded by small parking lots are predominant. A vacant Edmonds School District property is south of the transit center and 236th Street SW. This area was recently rezoned to allow greater density, including mixed-use development. North to 220th Street SW, the land uses to the west are initially single-family residential and then mostly commercial and multifamily, while the east side of I-5 is mostly single-family residential, with interspersed multifamily residential use. The City of Mountlake Terrace identifies the intersection of 220th Street SW and 66th Avenue West as the commercial center node that will include increased pedestrian access to surrounding areas.

Mountlake Terrace has adopted a form-based code for its town center that consists of six "districts." The central district allows mixed-use development up to seven stories high. Adjacent zones step down to transition to the existing single-family neighborhoods. The City has design standards for all new development in the town center.

Segment C: Mountlake Terrace to Lynnwood

Segment C is entirely within the Lynnwood city limits. Single-family residential use predominates in the south up to the Mountlake Terrace city limit, and then transitions to a mix of uses that includes commercial use northwest of I-5 and Alderwood Mall. Industrial uses occupy the west side of I-5 between 204th Street SW and 208th Street SW.

Segment C ends in the Lynnwood City Center, inside of the PSRC-designated regional growth center. The area is anticipated to accommodate much of the growth between Northgate and Everett with commercial, industrial, and residential uses. Most of the existing commercial uses are automobile-dependent businesses set back from the street frontage surrounded by surface parking lots. Buildings range from small single businesses to "big-box" retail and strip malls. Most of the residential uses are north and west of the city center in a mix of multifamily developments and single-family neighborhoods. Except for Group Health and the parcel owned by the Edmonds School District west of the city center, there are no major institutions in Segment C. The Edmonds School District's plans for its property include administrative buildings and a bus maintenance and storage facility.

Lynnwood's zoning regulations and design guidelines support a high-density neighborhood near the existing Lynnwood Transit Center, which is composed of three districts. The types of use permitted vary among the districts. All Segment C station alternatives are located in the "City Center West" zone, envisioned to have a mix of residential, retail, restaurant, office, and high-density housing. The tail track of the Preferred Alternative and Alternative C3 would cross 44th Avenue West into the higher-density "City Center Core" zone.

4.2.2 Long-Term Impacts

This section discusses Lynnwood Link Extension's consistency with land use plans and policies, and then describes each alternative's potential impacts on the existing and future land use patterns. Direct land use impacts would occur in locations where the light rail alternatives would require private or public property acquisitions for the proposed project facilities (e.g., alignment, stations, parking lots or structures, traction power substations, and stormwater control). These property acquisitions would convert property to a transportation-related use. Direct impacts also include proximity impacts (e.g., traffic, noise, and visual impacts) that could cause changes in adjacent land uses.

Sound Transit's property acquisitions are detailed in Section 4.1, Acquisitions, Displacements, and Relocations. This land use analysis also considers findings from other environmental elements, including Chapter 3, Transportation Impacts and Mitigation, and Sections 4.3, Economics; 4.5, Visual and Aesthetic Resources;

4.6, Air Quality and Greenhouse Gases; 4.7, Noise and Vibration; and 4.17, Parks and Recreational Resources.

No Build Alternative

The No Build Alternative includes the existing transportation system and future population and employment growth assumed in adopted plans, but without the Lynnwood Link Extension. No property would be acquired; as a result, existing land use patterns and types of land uses along the study corridor would not change in the immediate future. Planned and proposed development projects within the study corridor would continue to move through the local government permitting procedures and would be constructed.

The alternative would be inconsistent with portions of the regional land use and transportation policies that call for a mass transit system connecting the region's highest growth centers, including the Northgate Mall and the Lynnwood city center. Future development could still be allowed consistent with adopted plans, policies, and land use regulations current at the time development projects receive government approvals. However, before local jurisdictions could approve developments, they must meet transportation and land use concurrency requirements of the GMA by showing that the transportation system could accommodate the increased transportation demand of new developments. Under the No Build Alternative, a major transportation investment in the local and regional plans assumed to accommodate increased transportation demand would not be in place. Other related regional and local land use plan elements calling for communities to be developed in a more walkable, bikeable, and transit-oriented way also would not occur as envisioned.

Long-Term Impacts Common to All Light Rail Alternatives

This subsection evaluates the consistency of the light rail alternatives with land use plans and policies. It identifies, by project segment, direct impacts common to all the light rail alternatives, common indirect impacts related to transit-oriented development, and direct and indirect impacts of individual alternatives. These assessments are based on existing land use patterns and current zoning along the project corridor and within station areas.

Consistency with Land Use Plans and Policies

Regional, state, and local land use plans in the study area share the goal of improving transit accessibility and encouraging transit use. The Lynnwood Link Extension would connect employment centers and provide for uninterrupted transit access among the four jurisdictions in the project corridor. Sound Transit reviewed regional, state, local, and major institution master plans to determine whether the project would be consistent with the applicable goals and policies.

All light rail alternatives would support long-range planning and growth management to varying degrees. Local plans support Vision 2040's strategy of building on current growth management plans; directing future development generally into urban growth areas and focusing new housing and jobs in cities, particularly in the designated regional growth centers. The Preferred Alternative is generally consistent with regional and local plans and policies in the study area. Some of the other light rail alternatives have alignments or features that are less consistent with some aspects of local policies. However, at the regional level, all the light rail alternatives would provide a regional transit system serving a growing transportation need in planned high-density areas. Also, PSRC's *Growing Transit Communities Strategy* (2013), which reviewed several of the region's major transit corridors, including the "North Corridor" extending from Seattle to Everett, describes regional and local actions to encourage more housing, employment, and services close to major transit investments.

Connecting Lynnwood to other designated regional growth centers, such as downtown Seattle and, eventually, Everett, is a Sound Transit Long-Range Plan goal as well as an integral component of PSRC's *Transportation 2040*. Local land use planning documents focus on the types of land uses permitted within zones and the scale to which development is allowed within these zones.

The Lynnwood Link Extension would increase transit levels of service and linkages with other jurisdictions and regional destinations. In station areas such as at NE 145th Street and NE 185th Street, potential comprehensive plan and zoning changes by the City of Shoreline could result in more intensive land uses and economic development around those proposed stations. Most mixed-use developments would include residential and commercial uses rather than industrial or larger commercial developments. All stations would help serve existing land uses with improved mobility options.

In areas where the local jurisdictions have policies to leverage the increased mobility of light rail with higher development density (including mid- and high-density mixed use), also known as transit-oriented development, the Lynnwood Link Extension would support their goals and policies. In station areas outside of the I-5 right-of-way, local zoning might allow commercial uses to be included in transit parking structures.

The Lynnwood Link Extension is an essential public facility under the GMA; therefore, when Sound Transit's routing decision has been finalized, Seattle, Shoreline, Mountlake Terrace, and Lynnwood would have a "duty to accommodate" the project in their comprehensive plans.

All light rail alternatives would be consistent with the relevant plans and policies of the City of Seattle. The City's plans and policies focus future growth and developments into areas designated as urban villages and are supportive of high-capacity transit service to and from urban villages.

In 2012, the Shoreline City Council updated its *Comprehensive Plan*, with several station area planning policies as part of the update. These policies would support developments with residential components mixed with complementary commercial and office uses. The NE 145th Street Station subarea planning is underway, with the Draft EIS issued in January 2015. The 185th Street Station Subarea Planned Action Final EIS was issued in November 2014. Both are expected to result in *Comprehensive Plan* amendments and potential zoning changes for these station subareas later in 2015.

Lynnwood and Mountlake Terrace have policies that support more intensive land uses and economic development around the proposed stations, and both are preparing for regional transit improvements in their station areas. Both are either in the process or have recently amended their comprehensive and neighborhood plans to allow a greater density and mixture of land uses near the proposed stations. All light rail alternatives are generally consistent with the plans and policies of Lynnwood and Mountlake Terrace, except that Alternative B4 would be inconsistent with Goal 8 of the Mountlake Terrace Transit Service Strategy because it would close the freeway bus station.

Consistent with Lynnwood's designation as a regional growth center, the City has developed a vision and adopted plans and policies to achieve regional growth targets with a specific focus on the city center. The City completed a *City Center Sub-Area Plan* in 2005 with the following objective: "…to create within 20 years, a compact, intense and lively city center that offers Lynnwood new opportunities for culture, commerce and habitation."

The Lynnwood Link Extension would assist the project corridor cities in achieving their desired land use changes and densities. Further information on the project's consistency with plans, goals, and policies is provided in Appendix I-4.2.

Changes in Land Use

All light rail alternatives would acquire properties to build the Lynnwood Link Extension, as shown in Table 4.2-2. The Preferred Alternative would acquire an estimated 35 acres compared to a range from 20 to 38 acres considering all of the combinations of the light rail alternatives. Property acquisitions are detailed in Section 4.1 and Appendix I-4.1, Acquisitions, Displacements and Relocations. Although property acquisitions, displacements, and the conversion of land use would occur prior to construction, they are not considered a construction impact because of their long-term effects. Any acquisition of property would convert existing land uses to public right-of-way (which is a transportation-related use) for construction and operation of the Lynnwood Link Extension (i.e., staging areas, light rail track, stations, traction power substations, and parking facilities).

Table 4.2-2. Estimated Area of Acquisitions by Current Land Use (in acres)

[a] Land use designations developed from King County and Snohomish County assessor data.

[b] Does not include use of WSDOT property.

PA-A = Preferred Alternative for Segment A; PA-B = Preferred Alternative for Segment B; PA-C = Preferred Alternative for Segment C.

The land to be acquired would constitute only a small portion of the total land use for each category in the project vicinity and would not materially change the regional or local land use or development patterns. Following construction, remnant land originally purchased from private property owners that would not be needed for operation of the project could be made available for redevelopment consistent with local zoning. Visual and noise impacts, after mitigation, would not be at levels that would alter existing or planned future land uses.

Table 4.1-1 in Section 4.1, Acquisitions, Displacements, and Relocations, shows how many parcels in each alternative would be converted to a transportation-related use. The totals represent the number of affected parcels outside the existing transportation rights-of-way, based on conceptual design.

The development and redevelopment potential in station areas is discussed later in this section under Section 4.2.4, Indirect Impacts.

Segment A: Seattle to Shoreline

For all light rail alternatives, the conversion of properties to a transportation use for the Preferred Alternative would not markedly alter the predominant pattern of single-family land use in Segment A.

Most of the full property acquisitions in Segment A would be single-family residences. The total single-family acquisitions would range from about 8 acres to

about 10 acres, depending on the alternative. However, multifamily residential and commercial properties would also be affected. Alternative A5 would affect the most property in this segment, followed by the Preferred Alternative. Most of the affected properties would be single-family residential or parts of the I-5 right-of-way. Alternatives A3 and A11 would generally affect the least area; however, the alternatives overall would affect similar amounts and types of property.

All Segment A alternatives would realign 3rd Avenue NE in the vicinity of NE 117th Street, which would maintain access to the Seattle Latvian Evangelical Lutheran Church.

Preferred Alternative: At-grade/Elevated with NE 145th and NE 185th Stations

The Preferred Alternative would affect a similar number of single-family properties as the other Segment A alternatives.

There is an established residential neighborhood to the north and east, and a public golf course to the south of the proposed NE 145th Street Station site. The station would not alter these land uses. Shoreline's *Comprehensive Plan* and current planning encourage light rail in this area, which is consistent with City policies.

The Preferred Alternative has an optional station at NE 130th Street; this would not require more property acquisitions. With largely residential and some recreational and public land uses surrounding the station, there is a low potential for the station to change land use characteristics.

The City of Shoreline adopted policies supporting transit-oriented development as part of its updated 2012 *Comprehensive Plan,* in which the area around NE 145th Street is designated as a Light Rail Station Study Area. The plan allows redevelopment of existing land use north of NE 145th Street. The City's 145th Station subarea planning effort included a Draft EIS that was released in 2014.

With the NE 185th Street Station Option 1, the at-grade station would be east of I-5 and a park-and-ride facility in the WSDOT right-of-way west of I-5. The areas surrounding the station are largely residential, and the parking structure west of I-5 would be adjacent to the Shoreline Conference Center. No land use impacts are anticipated. The Preferred Alternative also has a NE 185th Street Station Shoreline Stadium Garage Option, which would place the parking garage on the current Shoreline Stadium parking lot. Both of these NE 185th Shoreline Stadium parking configurations would be consistent with the City's plans.

Alternative A1: At-grade/Elevated with NE 145th and NE 185th Stations

Alternative A1 would affect primarily single-family residential parcels but require fewer full single-family property acquisitions than most of the other alternatives.

Changes in land use are expected to be similar to those described above for the Preferred Alternative, except that the NE 145th Street Station Option 1 would acquire a row of single-family residences to accommodate a three-story parking structure for about 500 vehicles. The single-family residences to be acquired are along the south boundary of the neighborhood, and the conversion of properties to a transportation use would not markedly alter the predominant pattern of single-family land use.

Alternative A3: Mostly Elevated with NE 145th and NE 185th Stations

Alternative A3 is similar to Alternative A1, but is a mostly elevated profile alignment to NE 145th Street.

Land use impacts resulting from the NE 145th Street Station Option 2 or NE 185th Street Station Option 2 would be similar to those under the Preferred Alternative. While the stations differ in the number of residential properties displaced, changes in land use are expected to be similar to those described for the Preferred Alternative.

Alternative A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations

Alternative A5 is similar to Alternatives A1 and A3 but would have different station sites in its southern section, and a different site configuration for the station at NE 185th Street. It would have the most full single-family property acquisitions among Segment A alternatives, largely from the at-grade alignment and the need for land to accommodate three stations.

The NE 130th Street Station Option 1 is along the western boundary of a residential area where no property acquisitions would occur. It is also west of 5th Avenue NE. Because of the physical boundary of 5th Avenue NE and the mostly single-family residential surroundings, the station would not directly change land use and development patterns in the area.

The NE 155th Street Station would include a parking structure that would displace single-family residences. The potential is low for the station to cause additional changes in land use and development patterns. The City of Shoreline has not designated this area as a Light Rail Station Study Area in its *Comprehensive Plan's* Land Use Element.

The NE 185th Street Station Option 3 would have land use impacts similar to the NE 185th Street Station with Alternative A3, except for the areas used for parking under the Seattle City Light transmission line.

Alternative A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations

Alternative A7 is similar to Alternative A5, but with a mostly elevated profile alignment to NE 145th Street. Property impacts would mostly involve single-family residential properties along the alignment and at station areas, with Alternative A7 in the middle of the range for impacts from Segment A alternatives.

The effects by station would be similar to Alternative A5 for the NE 130th Street Station Option 2, but Alternative A7 would avoid any residential displacement. The effects of the NE 155th Street Station would be the same as under Alternative A5, where residential displacements and the park-and-ride would be the primary changes in land use. For the NE 185th Street Station Option 2, the long-term impacts of Alternative A7 would be the same as described for Alternative A3 and would primarily be from acquiring land for the station and park-and-ride facility.

Alternative A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations

Alternative A10 is similar to Alternative A1 up to NE 130th Street, then it is similar to Alternative A5. It would affect more properties than most of the other Segment A alternatives, in part because it would have three stations and more at-grade sections, which require more land.

The NE 130th Street Station Option 1 effects would be low with Alternative A10, as with Alternative A5. The NE 145th Street Station Option 1 would be the same as described for Alternative A1. The NE 185th Street Station Option 3 with Alternative A10 would have impacts similar to those described for Alternative A1. These effects would involve an at-grade station in a residential neighborhood adjacent to I-5 and parking areas that would displace residential properties and use the Seattle City Light transmission line right-of-way.

Alternative A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations

Alternative A11 is similar to Alternative A3, except that a NE 130th Street Station would be included. Alternative A11 would have the same level of impact on properties as Alternative A3; displaced uses would be single-family properties. Alternative A11 land use effects would be similar to those described for Alternative A3 because the NE 130th Street Station would have limited land use effects.

Segment B: Shoreline to Mountlake Terrace

Segment B would cause fewer property acquisitions and related changes to land use than Segment A, largely because Segment B has more available right-of-way to use along I-5. A small amount of single-family land use and vacant land would also be

converted to transportation-related uses. None of the light rail alternatives would alter the predominant pattern of single-family development in the area.

Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side

Much of the Preferred Alternative is within the interstate right-of-way, with relatively few direct impacts to individual properties.

An elevated station at the Mountlake Terrace Transit Center would be east of the existing parking structure, straddling 236th Street SW, and would serve the Mountlake Terrace Transit Center and park-and-ride. A small amount of institutional and public property would be acquired, mostly south of 236th Street SW, and converted to transportation use, but no displacements would occur.

The Preferred Alternative would be consistent with the City of Mountlake Terrace plans identifying this station area for future redevelopment as transit-oriented development. The City's *Town Center Plan* includes a civic center and also outlines a vision to spur development in the surrounding area. Land use and zoning have been modified to support this plan. The area south of the station has recently been rezoned to accommodate higher-density development.

The Preferred Alternative would acquire three single-family residences, but would not alter overall land use patterns.

The Preferred Alternative has an option to locate the 220th Street SW Station south of 220th Street SW, on vacant Edmonds School District property, which would require the Edmonds School District property and five residential properties to the south of it.

Alternative B1: East Side to Mountlake Terrace Transit Center to Median

Changes in land use would be similar to the Preferred Alternative. The median alignment reduces property impacts at the north end of the alignment but overall effects on land use would be similar. However, the median alignment would generally preclude a future station at 220th Street SW.

Alternative B2A: East Side to Mountlake Terrace Transit Center to West Side with 220th Street Station North Option

Alternative B2A would have impacts similar to the Preferred Alternative, except that an elevated station would be provided above 220th Street SW with a parking garage for up to 200 vehicles located on the north side of the street, with the access driveway off 60th Avenue West. The station would support the City of Mountlake Terrace's planning goals for higher-density mixed-use development in the area, which has employers such as Premera Blue Cross and the Mountlake Terrace City Hall, as well as numerous nearby multifamily developments east and west of I-5.

Alternative B4: East Side to Mountlake Terrace Freeway Station to Median

Alternative B4 would convert the least amount of land to a transportation use among the Segment B alternatives. It is primarily within the WSDOT right-of-way and would affect only six properties. Except for potential intensification of land uses east of the station area, changes in land use for Alternative B4 would be low.

The Mountlake Terrace Freeway Station would be located on I-5 at the existing flyer stop adjacent to the existing transit center. The freeway station would be extended to the north, retrofitted to accommodate light rail trains, and closed to bus use. This would be inconsistent with Goal 8 of the Mountlake Terrace Transit Service Strategy because it would close the freeway bus station, as discussed in more detail in Appendix I-4.2. The light rail station would be entirely within the median of I-5, with a new pedestrian bridge extending east over I-5 to 232nd Street SW. Small amounts of property would be acquired between I-5 and 232nd Street SW for this connection; however, no displacements would occur. North of the station, the median alignment would generally preclude a future station at 220th Street SW.

Segment C: Mountlake Terrace to Lynnwood

Segment C's proposed stations would be on the east end of the City Center West zone. The subarea plan for this zone includes a dense mix of commercial (office, retail, and service) uses and a concentration of residential units. In Alternative C3 the tail track would cross over 44th Avenue West ending in the City Center Core zone, which accommodates higher-density mixed-use development.

A key difference among the Segment C alternatives is the number of properties affected by acquisitions. The Preferred Alternative would affect 18 parcels with five full acquisitions. Alternative C1 would affect 31 parcels, with six full acquisitions, while Alternative C2 would affect 29 parcels with four full acquisitions, and Alternative C3 would affect 15 parcels with one full acquisition. Most of the acquisitions would be commercial, but multifamily, single-family, and public uses would also be converted. All alternatives would cross an Edmonds School District property, requiring a partial acquisition or easement.

Preferred Alternative: Along I-5 to Lynnwood Park-and-Ride Station

The Preferred Alternative would not displace any residences, but it would acquire one public and institutional parcel and four full commercial parcels north and east of the Lynnwood Transit Center, displacing nine businesses and acquiring parts of several other parcels. It would cross part of a property on which the Edmonds School District plans to develop a school bus base and other district administrative facilities. The elevated guideway would cut across an area planned for bus parking,

which would affect about five bus parking spaces, but circulation and the general layout of the master planned site would be maintained. The alternative would traverse the most southerly portion of Scriber Creek wetland complex. Compared to the original Alternative C3, the Preferred Alternative also would avoid bisecting a large block to the east of 44th Avenue West that the City of Lynnwood has identified for high-density development in its *City Center Sub-Area Plan*.

The Preferred Alternative would reconfigure parts of the existing park-and-ride in order to develop the light rail station and a parking garage. It would feature a plaza connecting to the intersection of 200th Street SW/Alderwood Mall Boulevard/44th Avenue West, nearer to the core of the City Center subarea. A tail track would extend across 44th Avenue West, occupying the front portion of several parcels on the south side of Alderwood Mall Boulevard, including a hotel. While the acquisition of all or part of several properties would change some of these existing land uses, the Preferred Alternative overall would not markedly alter the commercial or high-density residential character in the greater area.

Alternative C1: 52nd Avenue West to 200th Street SW Station

Alternative C1 would affect the most properties of the Segment C alternatives, acquiring all of the Cedar Creek multifamily residential condominium buildings and several single-family properties. This alternative would traverse the far northern portion of Scriber Creek Park, a Section 4(f) resource, converting these lands to a transportation use. This would affect the park but would not impact land use or development character in the Lynnwood City Center Zone area.

Commercial property would be acquired between the existing transit center and 200th Street SW and converted to transportation use as the parking structure that would serve the station. The tail tracks to the light rail terminus would displace some parking spaces that now serve commercial land uses.

The station would be compatible with existing land use and development patterns. The development of the station would not likely affect currently planned projects, most of which have transit-oriented development goals.

Alternative C2: 52nd Avenue West to Lynnwood Transit Center Station

Alternative C2 would acquire and convert slightly fewer properties than Alternative C1, and it would not convert any multifamily residential properties. It would convert parts of an existing park-and-ride facility but would provide a parking structure to increase parking capacity. The station would be at the west edge of the designated Lynnwood City Center. The alternative would traverse south of Scriber Creek Park, but through the wetland complex, with no change in land use.

The station would be compatible with existing land use and development patterns and would not likely affect currently planned projects, most of which have transit-oriented development goals.

Alternative C3: Along I-5 to Lynnwood Park-and-Ride Station

Alternative C3 would acquire and convert the most property to transportation use. The affected parcels would be mostly public with some commercial and industrial uses. These changes in land use are not expected to markedly alter land use patterns or development character in this area.

The Lynnwood Transit Center Station Options 1 and 2 have different layouts on the existing park-and-ride. Both would be compatible with area development patterns.

4.2.3 Construction Impacts

Construction impacts include changes to land use that could arise from other kinds of temporary impacts (e.g., noise, air quality, traffic, visual and aesthetic resources) on nearby properties.

Construction Impacts Common to All Light Rail Alternatives

Construction of the Lynnwood Link Extension would temporarily affect existing land uses due to construction activities (e.g., staging areas, earthmoving, and truck traffic). The temporary impacts would include increases in noise levels, dust, traffic congestion, visual changes, and increased difficulty accessing residential, commercial, and other uses. Chapter 2, Alternatives Considered, describes construction methods for the light rail alternatives. Although some businesses might experience hardship during construction, this would not affect the land use type unless the property became vacant.

For more information on construction impacts, including impacts on the existing uses (i.e., businesses and residences) and measures to avoid, minimize, and mitigate for those impacts, see Section 3.3 on transportation construction impacts, and Sections 4.3, Economics; 4.4, Social Impacts, Community Facilities, and Neighborhoods; 4.5, Visual and Aesthetic Resources; 4.6, Air Quality and Greenhouse Gases; and 4.7, Noise and Vibration.

Project construction would require temporary construction easements or acquisitions of private property and right-of-way owned by WSDOT and local jurisdictions. Any construction staging within I-5 right-of-way must also be approved by FHWA, considering factors such as safety, the environment, and potential impacts to the freeway. Construction easements would be temporary and the property returned to preconstruction conditions upon completion of the construction activities. Following construction, the undeveloped land originally purchased from private parties could be developed by Sound Transit or others consistent with local zoning.

Segment A: Seattle to Shoreline

No additional impacts would occur in Segment A other than those described above. Construction activity required for the Segment A alternatives would take place primarily on the east side of I-5, although the Preferred Alternative and Alternative A1 would realign a road and construct a parking garage on the west side of I-5. Most construction staging along the Segment A alignments would likely occur in the proposed guideway, station, and park-and-ride rights-of-way.

Segment B: Shoreline to Mountlake Terrace

No additional impacts would occur in Segment B other than those described above. Construction activity required for the Segment B alternatives would take place adjacent to the east side of I-5 (all Segment B alternatives), in the center median of I-5 (all Segment B alternatives) or on the west side of I-5 (Preferred Alternative and B2A). Most construction staging along the Segment B alignments would likely occur in the proposed guideway, station, and park-and-ride rights-of-way.

With the Preferred Alternative and Alternatives B1 and B2A, construction staging of the elevated Mountlake Terrace Transit Center Station would occupy part of the existing surface parking lot, and parking spaces would be temporarily displaced. Access to the existing parking structure would be maintained as well as bus operations that currently serve the transit center.

There may be opportunities to use vacant lots such as the vacant site south of 236th Street SW owned by the Edmonds School District for temporary replacement parking or construction staging.

Segment C: Mountlake Terrace to Lynnwood

No additional impacts would occur in Segment C other than those described above. Construction activity required for the Segment C alternatives would take place either in the center median of I-5 or on the west side of I-5, and near the Lynnwood Transit Center. Most construction staging along the Segment C alignments would likely occur in the proposed guideway, station, and park-and-ride rights-of-way.

4.2.4 Indirect Impacts

The project could indirectly affect land use by catalyzing others to develop or redevelop land near the project's facilities, and local governments may change land use codes to permit other development or redevelopment. Some of the possible indirect development might be transit-oriented development (TOD). Where appropriate, Sound Transit would facilitate TOD with local jurisdictions and potential development partners in accordance with Sound Transit's TOD policy. For areas within I-5 right of way, FHWA and WSDOT prohibit development that is unrelated to transportation.

Improved transit access can increase the convenience and desirability of surrounding residential, commercial, and office properties. Where stations have available land and supportive zoning in place, the resulting TOD would tend to be more intense, mixed-use development that supports high-density residential, commercial, and office-related uses.

Federal, state, regional, and local governments have an array of programs and policies to support transit-oriented development near mass transit projects. In 2011, Sound Transit identified key principles for its transit-oriented development program in its *Sound Transit Program TOD Strategic Plan* (Sound Transit 2011c); in 2012, the agency adopted the Transit-Oriented Development Policy (Resolution R2012 – 24). This policy has the following goals:

- Increase the value and effectiveness of transit by increasing transit ridership.
- Support implementation of state, regional, and local growth plans, policies, and strategies.
- Foster relationships with local jurisdictions, regional agencies, private developers, local residents, businesses, community groups and other stakeholders to facilitate transit-oriented development.
- Encourage convenient, safe multimodal access to the transit system, with an emphasis on non-motorized access.
- Support economic development efforts.
- Encourage creation of housing options including market-rate and affordable units.
- Support implementation of other related Sound Transit plans and policies, with an emphasis on the agency's *Sustainability Plan*.
- Protect and enhance Sound Transit's assets and investments.

The policy directs Sound Transit to consider transit-oriented development potential in the development of its transit projects. This includes identifying agency and community transit-oriented development opportunities and strategies, as well as considering opportunities for partnerships with public and private interests. The policy also encourages Sound Transit to consider transit-oriented development in its decisions about the acquisition, use, and disposition of land.

National studies of transit-oriented development typically cite three key conditions that indicate higher potential for development:

1. Stations are located in prime regional and community centers that are attractive to typical market forces.
2. Regional and local real estate markets are active.
3. Public policies and regulations allow or encourage intensive development in station areas.

The benefits of successful transit-oriented development have included improved mobility, increased supplies of affordable housing, increased transit ridership in a more

efficient urban form, and opportunities for urban redevelopment. Higher-density land uses around stations can also bring increased economic activity. Section 4.3, Economics, discusses the potential economic benefits associated with the Lynnwood Link Extension. In areas where the local jurisdictions have indicated a desire to attract transit-oriented development or have already adopted regulations consistent with this type of growth, the Lynnwood Link Extension would support their goals and policies. Sound Transit would be open for partnerships with local governments and others to develop the stations to help facilitate TOD, and would consider the potential for commercial uses in project-related parking structures located outside of the WSDOT right-of-way, and where consistent with local zoning.

Sound Transit completed a *Station Area Development Potential Report* to assess the potential for each proposed light rail station to support transit-oriented development (Sound Transit 2013a). To assess land use and economic development performance, the report considered access to regional growth centers and the station area development potential for the station areas served by each alternative. An overall rating was assigned to each station area based on its relative potential to support transit-oriented development, which was assessed according to four elements:

- Existing conditions supporting transit-oriented development
- Transit-supportive plans and policies
- Station access
- Potential development opportunities

The four elements, when considered together, allow an overall assessment of the development potential at each station area. The ratings for transit-oriented development potential are defined as limited, moderate, and strong. These qualitative ratings may change as the project design is refined and/or demographics change, new plans and policies are adopted by jurisdictions, and more detailed transit-oriented development analyses are completed. Table 4.2-3 shows the results by station area. A higher potential for transit-oriented development indicates a higher potential for indirect changes in existing land use and development patterns in station areas. However, the ratings closely relate to the types of currently allowed development within 0.50 mile of station areas based on existing plans and policies. The project would provide an opportunity for jurisdictions to implement regional policies related to mass transit (see Appendix I-4.2) as well as support increased densities, especially transit-oriented development.

Table 4.2-3. Station Area Transit-oriented Development (TOD) Potential

	Station Area	Overall TOD Potential	Existing Conditions Supporting TOD	Transit-supportive Plans & Policies	Station Access	Potential Development Opportunities
Lynnwood	**200th Street SW Station**					
	Lynnwood Transit Center Station					
	Lynnwood Park-and-Ride Station					
	Lynnwood Park-and-Ride Station - Modified (Preferred Alternative)					
Mountlake Terrace	**220th Street SW Station** (Preferred Alternative Option)					
	Mountlake Terrace Freeway Station					
	Mountlake Terrace Transit Center Station (Preferred Alternative)					
Shoreline	**NE 185th Street Station** (Preferred Alternative)					
	NE 155th Street Station					
	NE 145th Street Station (Preferred Alternative)					
Seattle	**NE 130th Street Station** (Preferred Alternative Option)					
	Northgate Station		Northgate Station not included in assessment - station constructed as part of Northgate Link project prior to Lynnwood Link Extension; overall assessment based on current development plans for the area. Northgate is a PSRC-designated Regional Growth Center and City of Seattle-designated Urban Center.			

Assess Potential

Limited Moderate Strong

Note: The station areas evaluated encompass an area 0.50 mile from the proposed station site, and the evaluation of TOD redevelopment opportunities did not consider unused land at the station site within the WSDOT right-of-way.

The Lynnwood station area has the highest development potential. Four station alternatives are being considered to serve the transit center in Lynnwood, and the potential for redevelopment is similar for each. Although the existing conditions include large blocks with automobile-dependent businesses and surface parking, the City of Lynnwood has developed specific plans and policies to achieve regional growth targets in this area. The transit station would reinforce intensification of nearby commercial and higher-density multifamily uses. Any such intensification would increase the activity levels adjacent to nearby residential properties.

The station areas with moderate development potential are those serving the Mountlake Terrace Park-and-Ride and the 220th Street SW Station (also in Mountlake Terrace). A station serving the park-and-ride has the potential to support future development in the City's proposed town center to the east and south, which could include intensifying commercial and higher-density multifamily uses primarily east of the station. The City of Mountlake Terrace has conducted more extensive transit-oriented development planning than the other jurisdictions. However, the station area development is limited by the amount of property dedicated to road rights-of-way (I-5) and the Nile Golf Course.

The remaining station areas have limited development potential, primarily because they are predominantly single-family neighborhoods, border large parks, or because current land use and comprehensive plans for these areas do not allow or encourage higher-density development. However, the City of Shoreline, as previously mentioned, has initiated light rail station area planning at NE 145th Street and NE 185th Street near I-5, which could facilitate transit-oriented development. The Comprehensive Plan and zoning changes implemented by the City of Shoreline or the Comprehensive Plan adopted by the City of Lynnwood could result in more intensive land uses and economic development around the stations.

4.2.5 Cumulative Impacts

Cumulatively, the Lynnwood Link Extension and other planned transportation and development projects would help achieve local and regional goals encouraging high-density, transit-oriented development. Other major planned developments could be attracted by the investments made by the project, and this incentive could accelerate the rate of development or redevelopment in station areas.

The Northgate Link Extension is currently under construction. King County Metro is planning a transit-oriented development project in the Northgate Station area, although details have not yet been defined. Both projects are designed to support improved transit service to designated urban centers, and both projects are consistent with land use plans for the area. The Lynnwood Link Extension, as well as other development projects around the station areas, would encourage the high-density development outlined in local and regional land use plans.

A Lynnwood site alternative is proposed for the OMSF, which is within an area that is currently zoned for commercial and light industrial uses; Alternatives C1, C2, C3, and the Preferred Alternative also would use parts of these parcels. If the Lynnwood site is chosen for the OMSF, it would increase the conflicts with the existing master plan by the Edmonds School District to develop a school bus base and other district administrative facilities. Sound Transit has identified a Bellevue location as the Preferred Alternative for the OMSF. A final decision on the site will be made after publication of the project's Final EIS in fall 2015.

4.2.6 Potential Mitigation Measures

No mitigation related to land use would be required during construction or operation of the Lynnwood Link Extension. In general, the project would not result in inconsistencies with adopted land use plans. Although Sound Transit cannot avoid all disturbances to adjacent land uses during construction, project impacts are not expected to cause substantial changes in land use. Therefore, no specific mitigation measures related to land use would be required for the project.

Refer to Section 4.1, Acquisitions, Displacements, and Relocations, for complete information on how Sound Transit would minimize the impacts associated with required acquisitions, displacements, and relocations. For measures that would minimize construction and operation impacts on adjacent land uses, refer to Chapter 3, Transportation Impacts and Mitigation, and Sections 4.3, Economics; 4.5, Visual and Aesthetic Resources; 4.6, Air Quality and Greenhouse Gases; 4.7, Noise and Vibration; and 4.17, Parks and Recreational Resources.

4.3 Economics

This analysis identifies the project's potential adverse and beneficial economic effects. Sound Transit evaluated direct and indirect economic impacts in the project area at three different levels:

- **Regional.** Economic impacts on the regional economy (such as effects on employment, traffic mobility, and congestion) were analyzed for King, Kitsap, Pierce, and Snohomish counties.
- **City.** Project effects were assessed on the tax revenue for cities with property acquisitions (Seattle, Shoreline, Mountlake Terrace, and Lynnwood).
- **Site-specific.** Site-specific impacts were evaluated for a 0.50-mile area around the light rail route and stations.

4.3.1 Affected Environment

Regional Demographic and Economic Trends

The forecast population data for King, Kitsap, Pierce, and Snohomish counties show that the region will grow by over 1.3 million inhabitants by 2040, which would total 5 million inhabitants, or about a 1 percent increase in population per year (PSRC 2013). The number of households is predicted to grow somewhat faster than the overall population, about 1.2 percent a year regionally, reflecting faster growth in smaller households. Generally, travel demand tracks more closely to the growth in the number of households than it does to population.

Median household income in the Central Puget Sound region is higher than the state average. The U.S. Census Bureau showed King County had the highest median household income in the region at about $70,000 in 2013. Snohomish County was second at about $66,000 in 2013 (Washington OFM 2014). Incomes in King County grew by 32 percent, while Snohomish County incomes increased by 24 percent, when compared to 1999 U.S. Census levels.

Employment in the region is expected to grow at an approximate average rate of 1.6 percent through 2040. The region also tends to have lower unemployment than the state or the nation, as shown in Figure 4.3-1. These trends support the predictions for generally increasing travel demand in the region and the project corridor.

The cities within the project area—Seattle, Shoreline, Mountlake Terrace, and Lynnwood—rely heavily on property tax and sales tax revenues to fund general services for their respective jurisdictions. Revenues collected by each city, other than taxes, consist of funding from federal and state sources, such as direct federal grants and state-shared revenues, and fees collected from government-operated facilities, including the issuing of licenses and permits. In addition to funding city programs, property tax levies also provide funds for county programs, fire prevention, libraries, schools, and other governmental services. Table 4.3-2 shows funding sources for each city.

Table 4.3-2. Revenue Sources: Percent of Revenues by City

City (Budget Year)	Property Tax	Sales Tax	Other Sources
Seattle (2014)	26	19	55
Shoreline (2014)	14	9	77
Mountlake Terrace (2013 to 2014)	22	10	68
Lynnwood (2012)	20	33	47

Regional Transportation of Goods and Services

Regional and interstate commerce relies on I-5, which is heavily congested. Longer travel times, increased costs, and less reliable pick-up and delivery times for truck operators result in some businesses being forced to move all or part of their business to less congested regions or avoid the Puget Sound region altogether.

In an effort to avoid moving away from the region, some transport companies are working with their customers to arrange deliveries in non-peak hours; however, many smaller customers do not find it cost-effective to extend their hours of operation. Traffic congestion also limits access to labor. As a result, companies might look to less congested parts of the metropolitan region or to other cities for future expansion. Chapter 3, Transportation Impacts and Mitigation, discusses future travel conditions, including freight, along the I-5 corridor.

4.3.2 Long-Term Impacts

A new light rail system such as the Lynnwood Link Extension can cause changes in the local business environment and surrounding neighborhoods. These changes, in turn, may benefit or adversely affect the success of existing businesses and influence future economic opportunity in the area. Direct economic impacts of each alternative could include business and employee displacements and the corresponding potential tax impacts, as well as potential changes in development patterns and regional freight mobility. Economic conditions could also change as a result of other effects such as the removal of businesses within an area, changes in parking availability, noise, visual conditions, or access. Indirect benefits could include increased economic activity around transit stations (transit-oriented development) as a result of increased pedestrian traffic, higher density and mixed land uses, and increased redevelopment opportunities.

No Build Alternative

Under the No Build Alternative, future economic development or redevelopment would be less because the project is a key element of the regional and local transportation, land use, and economic development plans. Traffic congestion would worsen, and the No Build Alternative could affect future economic development because it could make the project corridor communities comparatively less attractive as places to live or do business. The increased cost of doing business resulting from incidental and recurring delays with no alternative to avoid congestion includes the costs caused by travel delay and wasted fuel, that is, the value of lost time in passenger vehicles and the increased operating costs of commercial vehicles in congested traffic. Chapter 3, Transportation Impacts and Mitigation, provides further discussion of delays associated with future peak-period travel.

Light Rail Alternatives

Displacements

Table 4.3-3 presents estimates of the number of businesses and employees the light rail alternatives would displace due to property acquisitions in Segments A, B, and C.

In Segments A and B, the light rail alternatives would not displace businesses or employees.

In Segment C, the Preferred Alternative would displace nine businesses with an estimated 60 employees. In addition, partial acquisitions would affect parking at several parcels along 200th Street SW.

Alternative C1 would have the highest impact because Sound Transit would acquire properties holding 31 employers that provide a place of employment for an estimated 108 employees. Alternative C2 would affect three businesses with about 72 employees, and Alternative C3 would affect one business with an estimated 47 employees.

None of the Segment C alternatives affect even 1 percent of the employment within the Segment C study area (the areas within 0.50 mile of the alternative alignments), and much less than 1 percent of Lynnwood's total employment. Relative to the size of the employment base within the region, the business and employee displacements by the light rail alternatives would have a low impact on economic conditions regionally, but they would create disruptive transitions for the affected businesses and employees. Displacements are not necessarily permanent job losses because the displaced businesses would receive relocation assistance to help them continue operating, as described in Section 4.1, Acquisitions, Displacements, and Relocations. However, a business could relocate out of the area, or choose to accept compensation rather than reopening in a new location; in these cases, local jobs would be lost.

Table 4.3-3. Estimated Property Acquisition Impacts on Businesses and Employees

Alternative	Full Displacements		Commercial, Public, and Institutional Property Acquisitions	
	Businesses	Employees	Partial	Full
Segment A: Seattle to Shoreline				
Preferred Alternative: At-grade/Elevated with NE 145th and NE 185th Stations (with or without 130th Street Station Option)	0	0	8	2
Alternative A1: At-grade/Elevated with NE 145th and NE 185th Stations	0	0	4	1
Alternative A3: Mostly Elevated with NE 145th and NE 185th Stations	0	0	4	1
Alternative A5: At-grade/Elevated with NE 130th, NE155th, and NE 185th Stations	0	0	5	0
Alternative A7: Mostly Elevated with NE 130th, NE155th, and NE 185th Stations	0	0	5	0
Alternative A10: At-grade/Elevated with NE130th, NE 145th, and NE 185th Stations	0	0	4	1
Alternative A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations	0	0	4	1

Table 4.3-3. Estimated Property Acquisition Impacts on Businesses and Employees

Alternative	Full Displacements		Commercial, Public, and Institutional Property Acquisitions	
	Businesses	Employees	Partial	Full
Segment B: Shoreline to Mountlake Terrace				
Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side	0	0	2	1
with 220th Street Station South Option	0	0	2	2
Alternative B1: East Side to Mountlake Terrace Transit Center to Median	0	0	1	1
Alternative B2A: Optional 220th Street SW Station (elevated)	0	0	1	1

Impacts of Displacements on Tax Base of Cities

With each light rail alternative, Sound Transit would acquire residential and commercial properties and remove those properties from tax rolls. Table 4.3-4 estimates the annual initial property tax impacts on cities resulting from the loss of taxes on fully acquired properties. These property tax impacts reflect property taxes as of 2014. When referring to the property tax impacts of acquisitions, the term "initial property tax impacts" is used because the initial impact would be lower property tax revenue (longer-term impacts are described below). In most cases, the impact would be less than 0.25 percent of the local jurisdiction's property tax revenues; in all cases, the impact would be less than 1.5 percent. If businesses relocate outside of the local jurisdiction, this would also reduce local tax revenues, affecting revenue sources ranging from business and operations taxes to sales or payroll taxes.

Table 4.3-4. Estimated Initial Property Tax Impacts on Cities by Alternative

Alternative	Annual Initial Property Tax Impact	Percent of Budgeted City Property Tax Revenue
Segment A: Seattle to Shoreline		
Preferred Alternative: At-grade/Elevated with NE 145th and NE 185th Stations	$276,000	0.1
Alternative A1: At-grade/Elevated with NE 145th and NE 185th Stations	$241,000	0.1
Alternative A3: Mostly Elevated with NE 145th and NE 185th Stations	$224,000	0.1
Alternative A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations	$276,000	0.1
Alternative A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations	$248,000	0.1
Alternative A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations	$290,000	0.1
Alternative A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations	$224,000	0.1
Segment B: Shoreline to Mountlake Terrace		
Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side	$6,000	0.1
with 220th Street Station South Option	$15,000	0.4
Alternative B1: East Side to Mountlake Terrace Transit Center to Median	$0	0
Alternative B2A: Optional 220th Street SW Station (elevated)	$$17,000	0.4
Alternative B4: East Side to Mountlake Terrace Freeway Station to Median	$0	0
Segment C: Mountlake Terrace to Lynnwood		
Preferred Alternative Along I-5 to Lynnwood Park-and-Ride	$127,000	1.1
Alternative C1: 52nd Avenue West to 200th Street SW	$138,000	1.2
Alternative C2: 52nd Avenue West to Lynnwood Transit Center	$40,000	0.4
Alternative C3: Along I-5 to Lynnwood Park-and-Ride	$37,000	0.3

Sources: King County Finance Services, Finance and Business Operations, 2014 Real Property Tax Snohomish County Assessor's Office, 2014 Real Property Tax.

The consequence of full parcel acquisition is typically permanent conversion from private to public ownership. Parcels in public ownership are exempt from property taxes, but they are still assessed certain fees.

The project would have similar property tax impacts for all Segment A alternatives. These impacts, however, would be relatively small (0.1 percent) when compared to the combined 2014 estimated property tax revenues for Seattle and Shoreline (about $268 million). The property tax impacts would be caused mainly by acquiring single-family residences.

The Segment B impacts on property taxes would occur with the Preferred Alternative and Alternative B2A, and have about a $6,000 to $17,000 initial property tax impact annually. The Preferred Alternative with the 220th Street Station South Option would slightly increase property tax impacts.

As shown in Table 4.3-3, for all alternatives in Segment C, Sound Transit would acquire commercial, public, or institutional properties that are currently places of employment. The Preferred Alternative is in the same range as Alternative C1: although it affects fewer total properties, several are higher value parcels. The other two alternatives (C2 and C3) have lower impacts.

The long-term fiscal impact on a jurisdiction depends on a number of factors. Initially, property taxes would no longer be collected from the properties Sound Transit would acquire along the light rail route. As a result, the rates charged to remaining taxpayers could increase slightly (less than 0.01 percent) to recover budgeted funds, or budgets for essential government services could be reduced accordingly. In the long run, some of the land purchased for the construction of the Lynnwood Link Extension may not be permanently needed and could be released for development after the project is built. In addition, some displaced businesses would likely either rebuild at a new location or relocate to an existing building elsewhere within the jurisdiction's boundary.

These positive fiscal impacts could be offset somewhat by the absence of new construction that might have occurred on properties acquired and retained by Sound Transit. Thus, the long-term property tax impacts would have too many variables to be predicted quantitatively, but they would likely be less than the initial property tax impacts. The overall property tax impact is expected to be low.

Impacts on Regional Transportation of Goods and Services

The main impacts on regional transportation of goods and services would result from changes in freight mobility on the I-5 corridor and the surface street network. Compared to the No Build Alternative, the light rail alternatives would result in similar 2035 peak-period travel times in the corridor. Freight mobility changes for the light rail alternatives would be minor along the I-5 corridor. On city streets, all alternatives have mitigation that would cause similar or better conditions than the No Build Alternative. The light rail alternatives would allow travelers to use transit to avoid congestion, but regional freight conditions would stay similar to conditions without the light rail project. Chapter 3, Transportation Impacts and Mitigation, further discusses I-5 transportation impacts.

4.3.3 Construction Impacts

Construction brings money into the economy from construction wages, the purchasing of local goods and services for construction, the money spent by

construction crews in the community where construction occurs, and related tax revenues. On the negative side, constructing any light rail alternative would result in economic impacts by blocking visibility and access to businesses, causing traffic delays, and rerouting traffic on detours that increase travel times and make access to some locations difficult.

Potential Beneficial Economic Impacts from Construction

Constructing the Preferred Alternative and any of the other light rail alternatives would increase employment and associated consumer spending in the project vicinity during construction. The extent of these impacts would depend on the source of project funding and the composition of work crews used during project construction.

In economic impact analyses, typically only inflows of funds from outside a region are considered "new money" that will lead to new employment and income in that region. Funds from local or regional sources are transfers that could be spent by residents and businesses on other economic activities.

While federal grants may provide a source of funding, the local funds required for approximately one-half to two-thirds of the light rail alternatives' construction costs are anticipated to be raised primarily in the communities benefiting from the project. The influx of federal funds (assumed to be $600 million) would account for between one-third and one-half of the total capital cost, depending on the alternative selected within each segment.

In addition, construction would lead to positive economic effects beyond the federal grants. Sound Transit would issue bonds to pay for project construction, and this money would go primarily to businesses in the region within a relatively short period. Principal and interest on the bonds would be repaid over many years using a variety of funding mechanisms. Some of the future repayments also could be made in the form of taxes, such as sales and use tax. Therefore, there would be a temporary impact because bonded funds would be spent over approximately 6 years, stimulating direct and indirect construction spending in the region, but the added taxes to pay for the project could reduce spending in other areas of the economy.

Table 4.3-5 shows the estimated magnitude of the economic stimulus for the alternatives. It gives the range of direct expenditures and direct employees who would be hired as a result of the low- and high-cost estimates, based on the combinations of alternatives for each segment. The number of direct employees was calculated using the Washington Office of Financial Management's model for predicting employment based on construction cost estimates.

Table 4.3-5. Estimated Direct Expenditures and Direct Employment from Lynnwood Link Extension Construction

Cost Estimates and Employment	Project Construction
Preferred Alternative Cost Estimate	
Total direct expenditure (million in 2014 $)	$1,510
Direct Employment	
Total direct employment	8,860
Annual direct employment	1,480
High-Cost Estimate	
Total direct expenditure (million in 2014 $)	$1,940
Direct Employment	
Total direct employment	11,380
Annual direct employment	1,900
Low-Cost Estimate	
Total direct expenditure (million in 2014 $)	$1,390
Direct Employment	
Total direct employment	8,150
Annual direct employment	1,360

Source: Sound Transit and Washington Office of Financial Management Input-Output Model, 2011.

Wages paid to workers in construction trades or supporting industries would be spent on other goods and services; these are referred to as induced impacts. Indirect and induced impacts are often called "multiplier" impacts. Multiplier estimates for the state of Washington (Washington OFM 2007) suggest that an additional 64 percent of value added (i.e., payments made by industry to workers, interest, profits, and indirect business taxes) would result from new direct construction spending in the region. Moreover, an additional 0.94 new jobs would be created for every direct job associated with the project, increasing the potential number of jobs generated in the region from approximately 15,800 to 22,100 with the high-cost estimate.

Although the typical methodology for economic impact analysis would count only the $600 million of federal grant funding as new spending for the purpose of determining economic impacts, the actual benefits would be greater because of the multiplier effects. Regardless of the specific method used to quantify economic impacts, it is clear that the project would create substantial short-term economic activity in the region during construction and that all of the light rail alternatives would provide approximately the same magnitude of short-term economic impact.

Potential Adverse Economic Impacts from Construction

Construction activity affects local businesses because of the associated changes in traffic circulation, access, parking, noise, and visual effects. The work in Segment C would likely have the greatest impact on nearby businesses in terms of noise, dust, and restricted access, and potential customers might choose to avoid businesses due to real or perceived inconvenience caused by construction activities. Along any given

area of the project corridor, major construction is anticipated to last approximately 1 to 2 years.

All alternatives would require construction access from the WSDOT rights-of-way on I-5 and from city streets adjacent to the project corridor. All light rail alternatives would affect traffic operations on arterials adjacent to the light rail guideway and stations. For all street reconstruction, travel lanes on local streets along the guideway would experience periodic daytime closures. Truck access to the guideway during construction would be along city arterials leading to streets adjacent to the guideway. Construction activities along the guideway might reduce or restrict property access, and the contractor would need to maintain access during construction or coordinate with property owners and businesses.

In some locations, I-5 shoulders might be narrowed and/or lane widths reduced, with FHWA and WSDOT approval, to provide space for construction activities adjacent to the freeway. This configuration would increase congestion and travel times on the freeway, which would result in lost productivity and higher costs for businesses operating in the corridor.

4.3.4 Indirect Impacts

Sound Transit evaluated the indirect long-term economic impacts of the light rail alternatives based on the following: field observations of each alternative route, the number of housing units and employees to be served by the stations, and information presented in Chapter 3, Transportation Impacts and Mitigation; Section 4.2, Land Use; Section 4.5, Visual and Aesthetic Resources; and Section 4.7, Noise and Vibration.

The operation of the light rail alternatives could have both positive and negative indirect economic impacts. Light rail projects can increase development and redevelopment potential adjacent to stations, with potential increases in property values. Negative indirect economic effects arise from access or traffic flow changes or restrictions, decreased parking, noise increases, or impaired visibility that could reduce patronage of a business or decrease value in property.

The availability of light rail increases transit access and pedestrian activity, especially in areas surrounding the stations and between important nodes of economic activity. Improved transit access can positively affect the convenience, visibility, and desirability of nearby residential and commercial properties. Increased pedestrian activity can increase the patronage of adjacent retail businesses. This activity might create a synergy of business owners and employees being more interested in relocating where there is convenient access to the light rail line. This would lead to more dense and mixed land uses around stations and related increased economic activity. This pattern is referred to as transit-oriented development and is addressed further in Section 4.2, Land Use. The economic impacts are summarized here.

Numerous case studies conclude that residential and commercial property values near light rail transit stations typically increase and are valued higher than similar properties that are not near the transit stations (TRB 2004). While proximity to good-quality transit is an important trait of transit-oriented development, this is not the only factor that adds value. When combined with higher-than-typical densities, consumer retail and services, and pedestrian amenities, proximity to transit can confer land-value benefits that are well above those of competitive markets. The transit-oriented development synergy of proximity, density, mixed uses, and walking-friendliness, under the right conditions, is expressed through accelerated gains in property values and overall real-estate market performance (TRB 2004).

However, these gains are not automatic; property value increases generally require a strong demand for real estate, locations in neighborhoods free from signs of stagnation and distress, and public policies such as zoning bonuses that further leverage transit-oriented development and transit system expansion to produce the spillover benefits of a highly integrated transportation network. Property values are also affected by external forces and might change in response to fluctuations in the economy, consumer confidence, and local development pressures. In addition, because transit-oriented development takes time to evolve, property value benefits will also take time to accrue (TRB 2004). While these positive effects might occur in all the project segments because the jurisdictions have either adopted or are contemplating plans that would support transit-oriented development, the benefits would most likely be experienced in Northgate (Segment A) and Lynnwood (Segment C), where major regional urban growth centers are planned.

Many studies have found property value impacts from light rail transit are usually positive, although some studies have documented decreased property values, particularly along a light rail route rather than in the vicinity of stations (e.g., Cervero 2004). Disruptive noise levels; light, shadow, and view impacts; reductions in vehicle access and parking; and spill-over parking from station parking garages can harm property values and sales for businesses that depend on vehicular access. Negative impacts on property values would most likely occur when the light rail project results in noise or visual impacts noticeably greater than what currently exists. Such impacts are often associated with elevated, and to a lesser degree, at-grade alternatives. All of the Lynnwood Link Extension light rail alternatives would be at-grade or elevated. With mitigation measures implemented for the project, the impacts from noise, vibration, and traffic would decrease such that there would be a low potential for adverse indirect effects on economic activity.

Potential adverse indirect effects would be influenced by the same external forces described in the preceding paragraphs for the positive indirect effects, such as changes in real-estate demand, local zoning, or the local economic climate.

4.3.5 Cumulative Impacts

Other major projects in the project area include the Northgate Link Extension, which is already under construction. Its construction period is scheduled to end in 2019, and could overlap with the start of the Lynnwood Link Extension construction. Cumulatively, this extends the period of construction impacts in the Northgate area for a longer period than for either project alone. However, both projects would employ similar construction impact mitigation, which would minimize impacts. In addition, the Lynnwood Link Extension's civil construction period in the Northgate area is likely to be localized around the elevated guideway. Access to area businesses would be maintained throughout the construction period.

Sound Transit is also developing an EIS for an OMSF, which includes an alternative in Lynnwood; in July 2014, the Sound Transit Board identified a Bellevue site as the Preferred Alternative. A final decision on the site will be made after publication of that project's Final EIS in fall 2015.

There are also eight other transportation projects of regional significance, such as the SR 99 Alaskan Way Viaduct Replacement Project, SR 520 Bridge Replacement and HOV Project, and five private development projects. The Edmonds School District has a district support center and bus maintenance base project planned for a site in Lynnwood. The OMSF and the larger transportation projects would have similar or greater capital expenditures and multiplier effects on the regional economy as the Lynnwood Link Extension.

If the OMSF was constructed in Lynnwood near the Segment C alternatives, the two projects could be built during the same time period, and areas such as 52nd Avenue West and Cedar Valley Road could have a greater level of construction-related and impacts. The Edmonds School District's support services facility also could be constructed at the same time as the Lynnwood Link Extension, which could increase construction period impacts.

Similarly, if the maintenance facility was built on the Lynnwood site, economic impacts from displacements would increase cumulatively for all alternatives in Segment C because Sound Transit would have to acquire additional property for the proposed maintenance facility. Some of the parcels needed for Alternatives C1 and C2 would also be needed for the maintenance facility; however, a number of the partial acquisitions would likely change to full acquisitions, thereby increasing the number of business displacements and the amount of lost property tax revenue experienced by the City of Lynnwood. The maintenance facility would also displace some of the opportunities for increased development and redevelopment potential adjacent to stations or potential increases in property values southwest of the Lynnwood Link Extension station alternatives. This

would reduce the potential indirect economic benefits in an area identified as having the highest redevelopment potential along the project corridor.

4.3.6 Potential Mitigation Measures

Businesses near construction activities might be adversely affected during construction by noise, dust, and restricted access. Any major construction project inconveniences or disturbs the residents, businesses, and business customers adjacent to project construction activities. While some businesses would suffer little or no adverse effect, others might experience a noticeable decline in sales, increase in costs, or a decrease in efficiency. Mitigation for noise and vibration impacts is described in Section 4.7, Noise and Vibration. Construction might cause adverse impacts on businesses from reduced access or general construction activity that affects local transportation; the mitigation for such impacts is discussed in Section 3.6, Potential Mitigation Measures, of Chapter 3, Transportation Impacts and Mitigation.

Businesses displaced by the project would receive relocation assistance, as described in Section 4.1, Acquisitions, Displacements, and Relocations, to mitigate adverse impacts.

Sound Transit would dedicate staff to work specifically with affected businesses during construction to minimize project-associated impacts. Construction mitigation plans would be developed to address the needs of businesses and would include, but are not limited to, the following measures:

- Provide a 24-hour construction telephone hotline.
- Provide business cleaning services on a case-by-case basis.
- Provide signage such as 'detour,' 'open for business,' and others as appropriate.
- Establish effective communications with the public through measures such as meetings and construction updates, alerts, and schedules.
- Implement promotion and marketing measures to help affected business districts maintain their customer base, consistent with Sound Transit policies, during construction.
- Maintain access as much as possible to each business and coordinate with businesses during times of limited access.
- Provide a community ombudsman.

To avoid cumulative construction impacts, Sound Transit would coordinate construction mitigation planning with other project owners and potentially affected parties in construction areas with multiple projects in the same vicinity at similar times. Examples include projects such as the Northgate Link Extension and King County's Northgate transit-oriented development program.

4.4 Social Impacts, Community Facilities, and Neighborhoods

This section discusses how the Lynnwood Link Extension might affect people, businesses, community facilities, and neighborhood character and cohesion along the project corridor. The analysis reflects the findings of other environmental analyses, including transportation, property, land use, economics, visual and aesthetic resources, air quality, noise and vibration, parks and recreational resources, and public services. The section concludes with a discussion of environmental justice, which summarizes the analysis of impacts on minority and low-income populations in Appendix C, Environmental Justice Analysis.

4.4.1 Affected Environment

The study area for the social environment extends 0.5 mile from the alternative alignments and stations, and it has 18 neighborhoods (see Figure 4.4.1). The names and boundaries of most of the neighborhoods are designated by local governments—the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood.

Study Area Neighborhoods

Most of the study area neighborhoods were developed as single-family housing in the decades following World War II, primarily in the 1950s and 1960s. Growth has continued in recent decades through infill and redevelopment. As of 2010, nearly 126,000 residents and an estimated 60,000 jobs were located in study area census tracts.

Minority Populations

The residents within the project corridor are diverse, with an average of over 37 percent minority residents (non-White and Hispanic persons). In comparison, the population of the Sound Transit district (urbanized King, Pierce, and Snohomish counties) is 31.13 percent minority (Sound Transit 2013b). Attachments in Appendix C provide detailed racial and ethnic composition of the study area, neighborhoods, and the alternative alignment and station impact areas. Figure 4.4-2 shows the 2010 distribution of minority populations in the study area census tract block groups.

Low-income Populations

The study area household median income is about $58,000 (Census 2010b). An estimated 11.3 percent of the study area population lives at or below the federal poverty level, whereas the Sound Transit district is 11.24 percent (Census 2010b; Sound Transit 2013b). Appendix C has detailed low-income population statistics for the study area and neighborhoods. Figure 4.4-3 shows the overall 2010 distribution of low-income populations for study area census tracts.

Household Characteristics

A third of the households in the study area are one-person households (34 percent) (Census 2010a). About 12 percent of households are non-family units. Children and the elderly comprise 18 percent and 11 percent, respectively, of the study area population. An estimated 4 percent of all study area households are transit-dependent, but three neighborhoods (Pinehurst, South Lynnwood, and Lynnwood City Center) have more transit-dependent households (7 to 8 percent). Attachment C-7 in Appendix C has a detailed breakdown of these data.

About 54 percent of homes in the study area are owner-occupied and 46 percent renter-occupied (Census 2010b). Figure 4.4-4 shows the location of low- and lower-cost housing within about 0.5 mile of the corridor alternative alignments, which includes public low-income housing and mobile home communities.

Community Facilities and Linkages

Community facilities in the study area include public and private schools, parks, recreation and community centers, senior centers, libraries, municipal buildings, fire and police emergency services, medical clinics and hospitals, religious institutions, and cemeteries. Figure 4.4-4 shows the community facilities within about 0.5 mile of the light rail alternative alignments. A list is in Attachment C-13 of Appendix C.

Transportation Network

Many parts of the Lynnwood Link Extension corridor have streets with a grid pattern, particularly in King County, but I-5 interrupts this pattern. In King County, the highway generally is parallel to major north-south arterials, but the highway angles to the northeast in Snohomish County. Public bus service runs along most major arterials. Local streets tend to lack sidewalks, but traffic volumes are generally low. Chapter 3, Transportation Impacts and Mitigation, further describes the study area transportation system.

Cohesion

Neighborhood cohesion within the study area is relatively strong, with well-defined neighborhood boundaries, good transportation connections, stable land uses and housing, and opportunities for local interaction. In all cases, I-5 is a neighborhood boundary for adjacent neighborhoods. In Seattle and Shoreline, the western boundary of adjacent neighborhoods tends to be defined by Aurora Avenue, whereas the eastern boundary of adjacent neighborhoods is defined by 15th Avenue NE. The major east-west arterials tend to form the southerly and northerly boundaries of the neighborhoods. The grid street pattern also facilitates mobility and access within neighborhoods. Moving north into Mountlake Terrace and Lynnwood, Aurora Avenue remains a common boundary for neighborhoods west of I-5; however, the

Lynnwood Link Extension

eastern boundaries of neighborhoods east of I-5 are less well defined because the streets are not in a grid pattern and the landscape includes more natural barriers such as lakes, hills, and ravines.

Originally developed in the decades following World War II, the Lynnwood Link Extension corridor neighborhoods are mature. Land uses are relatively stable and many residents have lived in their same homes for decades. The neighborhoods have many public facilities and community amenities, with many places providing opportunities for interaction. Schools, libraries, community centers, churches, and neighborhood shops foster interaction between neighborhood residents. All of the local governments have neighborhood and community planning programs that foster community interaction.

4.4.2 Long-Term Impacts

The discussion below considers long-term impacts on the social environment from the construction and operation of the light rail alternatives compared with the No Build Alternative. It is based on the impacts and mitigation described in other environmental effects analyses in this Final EIS, and it assesses how the combination of changes resulting from the project might affect corridor neighborhoods and populations.

No Build Alternative

Under the No Build Alternative, no properties would be acquired and no households or businesses would be displaced. Existing community facilities and services would not be affected. The cohesion of the 18 neighborhoods adjacent to the Lynnwood Link Extension corridor would be similar to today, although local and regional congestion would increase. Otherwise, little change would occur in air quality, noise, or transit service coverage, although transit travel times and reliability would suffer. There would be little potential for disproportionately high and adverse effects on minority and low-income populations. These populations often depend on transit more than the general population, so they would not benefit from improved transit service, decreased travel time, increased reliability, and increased access to regional community facilities and jobs as provided under the light rail alternatives.

Light Rail Alternatives

Segment A: Seattle to Shoreline

Most of the non-public property acquisitions and displacements required for the project alternatives would occur in Segment A. The impacts would primarily be residential displacements; there would be no displacements of businesses or community facilities. As the acquisitions would generally be of intermittent strips of parcels along I-5, neighborhood cohesion would remain intact.

Population and Business Changes

The Segment A alignments and stations would be on the east side of I-5, where most of the property acquisitions and displacements would occur. However, the Preferred Alternative and Alternative A1 would both include a parking garage located on the west side of I-5 at NE 185th Street.

The Preferred Alternative would acquire 80 full parcels and parts of 50 parcels (see Table 4.1-1 in Section 4.1, Acquisitions, Displacements, and Relocations). Most of the full parcels are residential, and no businesses would be displaced. A total of 121 residential units would be displaced.

Acquisitions for the other alternatives would range from 66 to 81 full parcels and parts of 41 to 47 parcels; 107 to 123 residential units would be displaced.

Community Facilities and Transportation Network Changes

The project avoids a potential displacement of the Seattle Latvian Evangelical Lutheran Church, and none of the Segment A alternatives would displace the church and social hall; a church caretaker's residence would be relocated.

All Segment A alternatives would acquire a strip of land along the west edge of Ridgecrest Park adjacent to I-5. The Preferred Alternative and Alternative A1 also would affect an edge of the Shoreline Stadium parking lot, which serves the stadium, the Spartan Recreation Center, and the Shoreline Conference Center. The community benefits of these facilities would not be affected. The Preferred Alternative's NE 185th Street Station has a stadium parking garage option, which would place the parking garage on the current Shoreline Stadium parking lot and result in the partial acquisition or lease of a larger portion of the stadium parking lot. However, the same or greater levels of parking would remain long term for stadium use. See Section 4.17, Parks and Recreational Resources, for additional information.

Several streets, bridges, and sidewalks would be modified or reconstructed in Segment A. These changes would maintain access to community facilities, and would improve access in areas that have missing sidewalks, do not meet ADA access requirements, or have other features that do not currently meet design standards.

The Preferred Alternative's proposed light rail stations at NE 145th Street and NE 185th Street would increase transit options for travel to community facilities and amenities. There are seven parks, a King County district court, a library, and multiple social services at the Shoreline School District administrative and recreation facility within 0.5 mile of these two stations. There are also several low-income apartment complexes, four schools, a preschool, 17 churches, and a neighborhood commercial district within approximately 0.5 mile of these proposed stations. Similar types of community facilities and amenities are located within 0.5 mile of the NE 130th Street and the NE 155th Street Stations. Three neighborhood commercial

districts would be within 0.5 mile of the NE 130th Street Station under the Preferred Alternative option and Alternatives A5, A7, A10, and A11. Attachment C-13 in Appendix C lists community facilities and amenities by station area. Although the alternatives vary in terms of the stations they include, they would generally have similar benefits because they would provide improved access to similar sets of community facilities and amenities.

Character and Cohesion Changes

The character and cohesion of neighborhoods adjacent to the Segment A alternatives would not be notably altered from current conditions because the new light rail would be largely within the I-5 right-of-way and would not create an additional physical barrier. The light rail facility could be perceived as reinforcing I-5 as a barrier, but there would be no physical change to neighborhood interactions, and stations servicing all surrounding neighborhoods could help offset the sense of a barrier. Noise impacts would be avoided by mitigation measures that would be incorporated into the project, including noise walls on the guideway or ground, relocated traffic noise walls, and, in some cases, sound insulation in affected residences or buildings. See Section 4.7, Noise and Vibration, for details on project noise mitigation.

The Segment A alternatives would have full and partial acquisitions in the Pinehurst, Ridgecrest, Echo Lake, and North City neighborhoods, but the acquisitions would generally be along I-5 on the periphery of these neighborhoods. Clusters of acquisitions, however, would be needed for proposed stations at NE 145th, NE 155th, and NE 185th Streets, depending on the alternative. These acquisitions would affect from half a block to a block or more of homes in the station areas, all on the edge of the affected neighborhoods. At NE 145th Street and at NE 155th Street, other non-residential parcels are already in the area of the new station, and the impact on community cohesion from these acquisitions would be low. At NE 185th Street, 17 to 23 homes, mostly east of I-5, would be acquired for the station, parking facilities, and street improvements or realignments for the Segment A alternatives. Changes to movement, interactions, and cohesion in the neighborhood would be low. While the larger residential orientation of the neighborhood would remain intact, the loss of a block or more of homes and the introduction of a station with a park-and-ride would alter part of the neighborhood.

Segment B: Shoreline to Mountlake Terrace

Minor social, community facility, and neighborhood impacts would occur in Segment B as a result of the project.

Population and Business Changes

In addition to the I-5 right-of-way, the Preferred Alternative would acquire three residential parcels. An additional six parcels, including five residences and one vacant institutional parcel, would be acquired for the optional 220th Street SW Station.

Alternatives B1 and B4 would acquire two full parcels, but neither alternative would displace any residential units. In contrast, Alternative B2A would acquire seven full parcels, and displace five single-family residences. See Table 4.1-1 in Section 4.1 for more information. No businesses would be displaced under any of the Segment B alternatives.

Community Facilities and Transportation Network Changes

No community facilities would be displaced or adversely affected by the Lynnwood Link Extension in Segment B, and portions of the street and sidewalk network near stations would be reconstructed to improve access and mobility. The Preferred Alternative option for the 220th Street SW Station would be constructed on the site of the former Melody Hill Elementary School, which was demolished in the fall of 2013.

The Mountlake Terrace Transit Center Station under the Preferred Alternative and Alternatives B1, B2A, and B4 would increase transit options to a number of community facilities and amenities. A total of three parks, a recreation pavilion, library, senior center, senior housing complex, school, 12 churches or other religious institutions, a neighborhood medical clinic, and the Mountlake Terrace town center commercial district are located within approximately 0.5 mile of this station. This benefit extends to new light rail transit riders because existing bus transit riders have access to these community amenities from the existing Mountlake Terrace Transit Center. The optional 220th Street SW Station would make light rail more accessible to five parks, Mountlake Terrace City Hall, two low- and lower-cost housing complexes, three schools, and four churches. Attachment C-13 in Appendix C lists community facilities and amenities by station area for each of the project segments.

Character and Cohesion Changes

Neighborhood character and cohesion would remain intact for the eight neighborhoods adjacent to Segment B, and no new barriers would be placed within the existing neighborhoods. While Shoreline and Mountlake Terrace have neighborhoods on either side of I-5, the new light rail largely within the highway right-of-way would not represent an additional physical barrier although it could be perceived as

reinforcing the physical separation. The transit stations would attract patrons from adjacent neighborhoods, which could help offset the sense of a barrier. Other effects such as noise and visual impacts would be mitigated, although some visual impacts may not be fully mitigated. Neighborhood character and cohesion would not be adversely affected under any Segment B alternatives.

Segment C: Mountlake Terrace to Lynnwood

Population and Business Changes

In addition to the I-5 right-of-way, the Preferred Alternative for Segment C would require acquisition of five full parcels. It would displace nine businesses with approximately 60 employees, but no residences.

Alternative C1 would displace one single-family residence and a condominium complex with 76 residences. Acquisition of three commercial properties would displace 31 businesses with 108 employees. Alternatives C2 and C3 would affect several businesses, and displace fewer employees and residences. See Table 4.1-1 in Section 4.1 for more information. For all light rail alternatives, if the affected businesses relocate within the area, the potential loss of employment from business displacements could be reduced. However, some of the businesses may relocate out of the area or choose to close, which would adversely affect the employees (see Section 4.3, Economics, on economic impacts).

Community Facilities and Transportation Network Changes

No community facilities would be acquired in Segment C. The light rail guideway would be elevated over the Interurban Trail and the Scriber Creek Trail under all Segment C alternatives, but the effects would not alter the functions or essential attributes of the trail. The Preferred Alternative would pass about 400 feet southeast of privately owned Halls Lake, but would be along the freeway. The Preferred Alternative and Alternative C3 would generally parallel I-5 and traverse the most southerly portion of the Scriber Creek wetland complex, and would be only partly visible from Scriber Creek Park to the north. Alternative C1 would traverse the far northern portion of Scriber Creek Park at the parking area. Alternative C2 would traverse to the south of the park through the wetland complex. Public comments on the Draft EIS emphasized the importance of the park to the community, as summarized in Chapter 7, Draft EIS Public Comments and Responses. Section 4.17 discusses the impacts on Scriber Creek Park.

With Alternatives C1 and C2, the elevated track would be on the east side of 52nd Avenue West across the street from the Cedar Valley Grange Hall, with no effects on the hall's activities.

All alternative stations would be located within the Lynnwood City Center neighborhood and regional commercial district. Light rail transit patrons would have access to four parks, seven low- and lower-cost housing complexes, three churches, the Cedar Valley Grange, and a major medical clinic within 0.5 mile of the station. The Lynnwood public library and civic center are located just beyond 0.5 mile from the station. The proximity of the other locations for the Lynnwood light rail station would similarly provide access to these types of community facilities and amenities. This benefit extends to new light rail transit riders as existing bus transit riders have access to these community amenities from the existing Lynnwood Transit Center. Attachment C-13 in Appendix C lists community facilities and amenities by station area for each of the project segments.

Character and Cohesion Changes

General neighborhood character and cohesion are not expected to change for the three neighborhoods adjacent to Segment C. None of the alternatives would require property acquisition or displacement impacts in the South Lynnwood or Hazelwood neighborhoods; therefore, character and cohesion would not change in these two neighborhoods. All of the Segment C acquisition and displacement impacts would occur in the Lynnwood City Center neighborhood.

Developed land uses in the Lynnwood City Center neighborhood are primarily large-lot commercial and industrial uses. The Preferred Alternative and Alternative C3 would have the least effect on this neighborhood because these two alternatives would largely be adjacent or parallel to I-5. Both would avoid displacing a condominium complex, although the Preferred Alternative would displace nine small retail businesses meeting the needs of community residents. Alternative C3 would only displace one business. See Section 4.3 for a discussion of potential economic impacts.

Alternatives C1 and C2 would travel along the east side of 52nd Avenue West, which is the eastern boundary of the neighborhood. Alternative C1 would travel through the northern part of Scriber Creek Park and displace the 76-unit condominium complex and 31 businesses and institutions. Alternative C2 would turn eastward before the park, thus avoiding all but one residential and three business impacts. Both of these alternatives would feature design measures to avoid noise impacts, but the elevated guideway would change views.

Alternative C1's displacement of the condominium complex would adversely affect the complex's property owners and residents, but would not affect the overall character and cohesion of the Lynnwood City Center neighborhood.

4.4.3 Construction Impacts

Lynnwood Link Extension construction activities that would temporarily affect the social environment are discussed below. In most sections of the project corridor where property would be acquired for permanent facilities, it could also be temporarily used for construction staging. However, where construction staging or construction activities require acquiring additional land and displacing businesses or residences, the impact is considered a long-term impact.

Population and Business Changes

During the project's approximately 6-year construction period, residents, businesses, and business employees and customers would be near construction activities. However, in any given location, major construction along the guideway would only last 1 to 2 years. In many cases, the heaviest construction activities would last less than a year, followed by train control and electrical systems development, finish work, and testing leading up to light rail operations. Construction periods would be longer at the stations and park-and-rides. As a temporary condition, construction would be unlikely to affect population levels or businesses.

Community Facilities and Transportation Network Changes

During construction, access to community facilities and general mobility for all modes of transportation would at times be affected by increased congestion, reduced use of traffic lanes or sidewalks, and closure of some streets and sidewalks. These changes would result in small increases in travel distance and travel time. North-south bus transit routes are not expected to be adversely affected, although travel on routes may be slow or detoured at times, particularly at arterial crossings of I-5 where light rail stations would be constructed, e.g., NE 145th Street, NE 185th Street, 236th Street SW, 46th Avenue West (direct access ramp), and 48th Avenue West. Access to and from neighborhood community facilities and to destinations outside of neighborhoods may be affected. Construction could also have temporary impacts on parking and local circulation.

Character and Cohesion Changes

Sound Transit plans to locate most of the staging areas and construction access within the property required for permanent rights-of-way. Some other properties may also be required for construction, including the WSDOT right-of-way (subject to WSDOT and FHWA approval), other transportation rights-of-way, and nearby vacant and/or undeveloped parcels. Construction work would create short periods of increased noise, vibration, dust, construction truck traffic, and visual changes, but generally these effects would be limited to properties immediately adjacent to the

construction areas. Section 4.7, Noise and Vibration, further discusses potential disruption to adjacent neighborhoods from construction noise and vibration.

In Segments A and B, the construction effects on social cohesion would be limited because I-5 already functions as a boundary between neighborhoods. In Segment C, Alternatives C1 and C2 follow an arterial into the Lynnwood City Center neighborhood and would be adjacent to commercial and light industrial properties as well as residences. The construction activities with these two alternatives and the related noise, vibration, dust, visual impacts, and truck traffic would be more in the center of the neighborhood than with the Preferred Alternative and Alternative C3, which continue generally adjacent to I-5. Still, only a portion of the larger Lynnwood City Center neighborhood would be affected, which would limit changes to overall neighborhood character and cohesion.

4.4.4 Indirect Impacts

Over time, implementation of the Lynnwood Link Extension could result in indirect impacts, particularly in station areas. The presence of the light rail transit facilities could result in transit-oriented development at some station locations as allowed by local zoning regulations. Several of the jurisdictions along the project corridor have initiated station area planning or already adopted plans allowing transit-oriented developments in station areas, which could result in changes to the types of development that may occur there. For example, areas that are currently low-density residential could ultimately transition to more dense residential or mixed-use developments. Section 4.2.2 in Section 4.2, Land Use, further discusses potential long-term changes in land use. These changes could alter the existing character of some neighborhoods, particularly the Lynnwood City Center neighborhood where the potential for transit-oriented development is highest. In the long term, the station areas at the edges of neighborhoods may become new neighborhood activity centers, which could support enhanced livability and sustainability.

4.4.5 Cumulative Impacts

Cumulative effects could occur in the project corridor neighborhoods if large development projects or transportation improvements were located in neighborhoods adjacent to the light rail alignment.

Other major projects could be constructed concurrently in neighborhoods that would be affected by construction of the Lynnwood Link Extension. Construction of the Northgate Link Extension guideway and station could overlap with the start of the Lynnwood Link Extension construction. King County Metro is planning a transit-oriented development project at the Northgate Station. Cumulatively, this may extend the duration of construction activities and impacts in the Northgate area. Sound Transit will coordinate the development of construction mitigation plans for the

Lynnwood Link Extension with those for the Northgate Link Extension and other projects with concurrent construction timeframes.

The OMSF alternative site in Lynnwood east of 52nd Avenue West and north of I-5 is near neighborhoods with minority and low-income populations. On June 24, 2014, the Sound Transit Board identified a site in Bellevue as the preferred site for this facility. The final decision about which project will be built will be made by the Sound Transit Board after publication of that project's Final EIS. If Sound Transit were to select the Lynnwood site for the OMSF, it would displace businesses and other enterprises in an area that is currently developed with light industrial and commercial uses. The proposed facility would not notably alter transportation conditions, including neighborhood accessibility or traffic levels. Construction impacts (such as noise, light and glare, dust, and traffic) of the two projects would affect the nearby residential areas more than impacts of just the Lynnwood Link Extension.

The Edmonds School District master plan includes a district support facility on property that includes administrative offices and bus maintenance and storage in Lynnwood. This property overlaps partly with the Lynnwood site alternative for the OMSF. The development of one or both of these projects would be within an area with other light industrial uses. With a residential neighborhood across the street, Sound Transit would undertake best practices to minimize adverse construction effects on residents, such as impacts due to construction traffic, dust, light and glare, and noise.

The impacts of the Lynnwood Link Extension alternatives, in combination with other past, present, or future projects and actions, with available mitigation applied, would not result in appreciably higher impacts on communities or neighborhoods.

4.4.6 Potential Mitigation Measures

The project's social impacts, including impacts on community facilities and neighborhoods, would generally be low.

Sound Transit would implement the design and mitigation measures identified in other chapters and sections of this Final EIS to help minimize effects on the quality of life and neighborhood cohesion, including:

- Chapter 3, Transportation Impacts and Mitigation, which describes measures to address impacts from local congestion (Section 3.6.4), parking (Section 3.6.7), and construction (Section 3.6.9)
- Section 4.1, Acquisitions, Displacements, and Relocations, which describes measures to provide compensation and assistance to affected parties
- Section 4.3, Economics, which includes measures to minimize construction impacts on businesses

- Section 4.5, Visual and Aesthetic Resources, which outlines mitigation to address areas with high visual impacts
- Section 4.6, Air Quality and Greenhouse Gases, which identifies practices to reduce construction air quality concerns
- Section 4.7, Noise and Vibration, which outlines the project's commitments to address impacts
- Section 4.15, Utilities, which describes measures to reduce impacts to utilities – both the utility system as well as area residential and commercial customers
- Section 4.17, Parks and Recreational Resources, which describes how park impacts would be reduced during construction and longer term

To reduce potential cumulative impacts of potentially concurrent construction activities in the Northgate area and in Lynnwood, Sound Transit would coordinate planning efforts with the other projects, including identifying appropriate design measures, mitigation, and community outreach to minimize adverse effects.

4.4.7 Environmental Justice Analysis and Determination

The assessment of environmental justice impacts is required by Presidential Executive Order 12898, Federal Actions to Address Environmental Justice to Minority Populations and Low-Income Populations (February 11, 1994); the U.S. Department of Transportation (USDOT) Order 5610.2, Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (April 15, 1997); and the USDOT Order 5610.2(a) (May 2, 2012), updating the USDOT policy to consider environmental justice principles in all programs, policies, and activities. The guiding principles followed by FTA, as described by FTA Circular 4703.1, are to (1) avoid, minimize, and mitigate disproportionately high and adverse effects on minority and low-income populations; (2) ensure full and fair opportunities for public involvement by members of minority and low-income populations during project planning; and (3) prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations. The discussion below summarizes the environmental justice analysis provided in Appendix C, which also describes outreach to environmental justice populations and includes detailed statistics on neighborhoods along the project corridor.

Since the start of project planning, Sound Transit has been conducting community outreach and public involvement activities that include targeted outreach to minority and low-income populations. To involve ethnic populations with limited English proficiency, mailings and handouts have included text translated into foreign languages common in the study area. FTA and Sound Transit also contacted six federally recognized tribes with interests in the area as well as non-federally recognized tribes. Appendix L, Public Involvement and Agency Coordination, includes a complete listing

of project outreach events and notices. Appendix C discusses comments and concerns from meetings in areas with low-income and minority groups.

The primary impacts of the project affecting individuals or businesses would be from property acquisition and displacement, but compensation and relocation assistance in accordance with federal regulations and Sound Transit policies would prevent these impacts from being high and adverse. Sound Transit anticipates that some low-income and minority individuals would be affected by residential and business acquisitions, based on demographic information for the corridor communities and as a result of public outreach, including meetings with property owners. While property acquisitions and the resulting displacements would be unavoidable, they would be mitigated through Sound Transit's real property acquisition policy, including its compensation and relocation assistance program. Table C-2 in Appendix C has more details on the project's impacts on minority and low-income populations.

Moreover, the Lynnwood Link Extension would have offsetting benefits, as summarized in Section C-6.2 of Appendix C. The light rail alternatives would improve access to regional activity centers and employment opportunities. Light rail transit would be more reliable and more frequent, with increased hours of service. These improvements would particularly benefit transit-dependent persons, including those having more than one job or working swing and graveyard shifts, due to extended operating hours of the light rail system compared with the bus transit systems. The light rail extension would reduce air quality criteria pollutants and mobile source air toxic pollutants compared to the No Build Alternative. Ambient noise levels may be reduced, particularly where there are no noise barriers or where replacement noise barriers would be constructed. Because of recent planned and proposed changes in municipal comprehensive and neighborhood plans, proposed stations in Mountlake Terrace, Shoreline, and especially Lynnwood could result in more intensive land uses, economic development, and mixed land uses to support neighborhood livability and sustainability. As such, the project would benefit those closest to the project even though they are most likely to be affected by the project.

Based on the findings of impacts described in this Final EIS and considering the mitigation measures to which Sound Transit is committing, project impacts would not be high and adverse. Design measures, best management practices (BMPs), offsetting benefits, and mitigation commitments would reduce the severity of individual or cumulative impacts on all populations, including minority and low-income populations, to levels that would not be high and adverse.

FTA has concluded that Sound Transit's Lynnwood Link Extension would not result in disproportionately high and adverse effects on minority and low-income populations.

4.5 Visual and Aesthetic Resources

Visual and aesthetic resources include the natural and built features of the landscape that contribute to the public's appreciative enjoyment of the environment. These resources can include individually identifiable features such as natural landmarks (for example, mountain peaks and hills, bodies of water, or stands of trees), constructed features (individual buildings or the downtown skyline), or entire landscapes such as a valley ringed by hills.

Impacts on the visual environment are defined in terms of the extent to which elements of the proposed project would change the perceived visual character and quality of the environment. Appendix G, Visual Simulations and Illustrations, provides detailed visual simulations produced for this analysis.

The study area for visual and aesthetic resources consists of viewsheds along the Lynnwood Link Extension corridor (Figure 4.5-1). These viewsheds represent distinct landscape units from which the project alternatives are visible. They encompass the travel lanes of I-5 for most of the route, and they also include areas on either side of the project corridor where people could see the project alternatives. The viewsheds are defined by changes in topography, neighborhoods, streets, bridges, or tree cover, and they range in width from a half block to up to 0.5 mile from the project corridor. The viewpoints Sound Transit used for the EIS simulations illustrate typical views of the alternatives, or locations from which project features are particularly prominent.

4.5.1 Affected Environment

Sound Transit began this visual analysis by assessing the visual character and visual quality of the landscape, and then considering how typical viewers may respond to what they see around them. The Lynnwood Link Extension EIS *Technical Analysis Methodologies* report describes the visual analysis methods in more detail, including how Sound Transit adapted FHWA's and WSDOT's guidelines for visual analysis. The FHWA guidelines provide a generally accepted methodology for preparing visual assessments for linear transportation projects and are appropriate for use on this project.

Visual character refers to identifiable visual information, including visual elements and major environmental features.

- Preferred Alternative (PA)
- Preferred Alternative Station Location
- Other Light Rail Alternatives
- Other Alternative Station Location
- Preferred Alternative and Other Alternatives
- Viewshed Lines
- Viewpoints

Figure 4.5-1
Viewsheds and Viewpoints Locations

Visual quality refers to the evaluation of the visual experience to the public and is described in terms of vividness, intactness, and unity. *Vividness* refers to the way landscape components combine in distinctive and memorable visual patterns. *Intactness* refers to whether the natural and human-built visual patterns form a consistent landscape, or whether highly contrasting features intrude into the view. *Unity* refers to the visual coherence and compositional harmony of the landscape considered as a whole.

Viewer response reflects viewer exposure and viewer sensitivity. *Viewer exposure* refers to where viewers are and how long they are typically there, including highway users and people in the surrounding neighborhoods. *Viewer sensitivity* refers to how viewers perceive the environment and what they find important. Viewer sensitivity can be affected by what the viewer is doing; the visual context; and the values, expectations, and the interests they may have. For each viewshed and potential viewer group, viewer sensitivity is rated as high, average, or low. High sensitivity represents viewers who highly value a particular view, and low sensitivity represents viewers who do not regard the visual setting as important to their activities. For example, residential viewers are typically rated as having high sensitivity. Persons driving for pleasure or tourists visiting an area to enjoy scenic features have a high awareness of features and high sensitivity. Individuals engaged in recreation activities in parks or on trails have a high awareness and sensitivity to the surroundings. An average sensitivity rating reflects the experience of people who view the visual context as a secondary feature of other activities. For example, these could be persons at work or shopping who may value a pleasant environment but are not at a specific location for the purpose of enjoying the scenery. Drivers and vehicle occupants passing through an area are less sensitive to the visual context because they are focusing on features other than the surrounding landscape and generally have an average to low sensitivity. Low viewer sensitivity generally describes the experience of persons engaged in activities that render the quality of their surroundings as irrelevant or incidental.

Based on these visual quality considerations, different levels of visual quality have been assigned to describe the viewsheds in the corridor:

High Visual Quality describes views with vivid, memorable, distinctive features in a landscape with compositional harmony, or where elements of the landscape fit together in a visual pattern that is free from encroaching elements.

Medium Visual Quality describes views with a unity or compositional harmony between elements of the landscape that produce a pleasing overall impression in which encroaching elements are minor and do not substantially alter the perception of the landscape as a unit. These views lack vivid, memorable features and are generally characterized as common or ordinary.

Low Visual Quality describes views that lack a dominant visual character in which there is a low level of fit between disparate elements. In some cases, these views appear disorganized with features that seem out of place, or are views with some compositional harmony but include eyesore elements that can dominate one's perception.

The visual quality of an area has a complex relationship to viewer sensitivity. In an area with high visual quality, such as a spectacular view, a person who does not regularly see the view or is distracted by the driving experience may still place a high value on the view. In an area with low visual quality, persons still may object to views that fall short of their visual goals for the area.

Appendix G includes photographs from viewpoints within each viewshed. Appendix I-4.5, Visual Quality and Aesthetic Resources, has more detailed descriptions of the viewsheds and their defining characteristics.

Highway Beautification Areas

There are areas along the I-5 right-of-way that were acquired by FHWA and WSDOT for the "restoration, preservation and enhancement of scenic beauty adjacent to the highway." They were intended to preserve and perpetuate the natural character of Washington, supporting tourism and a positive sense of place for local communities, and offering benefits such as improving water quality and enhancing wildlife habitat.

Segment A, Viewshed 1—NE 92nd Street to NE 115th Street

Viewshed 1 includes the Northgate area of Seattle. Major features include the Northgate Mall, surrounding multistory buildings with residences and businesses, and the North Seattle Community College campus and I-5 to the west. This section of I-5 is generally about 20 feet higher than the surrounding area, and it has moderately dense linear stands of trees and shrubs along the margins of the corridor. Viewers include drivers and occupants of vehicles on I-5 and local arterials (low to medium viewer sensitivity), shoppers in retail areas (low to medium viewer sensitivity), occupants of office buildings (low to medium viewer sensitivity), and residential occupants of multistory buildings on both sides of the corridor (high viewer sensitivity). Visual quality in the viewshed is medium to low for all viewer groups. The urban uses have a wide variety of building sizes and character, which tends to reduce unity. Elements of the streetscape, including street trees, provide some compositional harmony through a similar street-level character over most of the area, as illustrated in Viewpoints 1, 2, and 3.

Segment A, Viewshed 2—NE 115th Street to NE 133rd Street

Viewshed 2 has single-family residential areas on both sides of I-5, along with churches on both sides and a park on the west side of the freeway. There are continuous noise walls along both the sides of I-5 that block views of the travel lanes from residential areas. Residents and park and church users are highly sensitive to changes in the landscape. Drivers and vehicle occupants on I-5 have average to low visual sensitivity. The overpass at NE 117th Street and freeway signs can be seen

from adjacent residences and streets. There is limited vegetation along I-5, but moderately dense vegetation east of the noise walls. The visual quality of views from the residential area is medium to high due to the similar building scale and moderately dense landscaping that provide a homogenous street-level character and buffers the freeway from views, as illustrated in Viewpoints 4, 5, and 6. The visual quality of I-5 is low due to the framing of the highway by noise walls that provide little visual interest.

Segment A, Viewshed 3—NE 133rd Street to NE 152nd Street

Viewshed 3 includes 5th Avenue NE and the Jackson Park Golf Course to the east, with a single-family residential area and private school campus on the west side. The freeway interchange at NE 145th Street is bounded by residential areas to the north and east. This section of I-5 has dense trees and vegetation along both sides of the freeway. Residents and golf course users are highly sensitive to changes in the landscape. The visual quality of the golf course is medium to high due to the unity and compositional harmony of a landscaped setting and mature vegetation that buffers views of encroaching features such as I-5. Residential areas are of medium visual quality due to their homogenous character. The visual character of I-5 is generally medium due to the framing of the highway by dense vegetation on both sides. The view from southbound vehicles from NE 155th Street to NE 145th Street has higher visual quality where Mount Rainier is a distinctive and memorable element in the distance, and results in medium to high visual quality. The visual character of this area is illustrated in Viewpoints 7 through 13.

Segment A, Viewshed 4—NE 152nd Street to NE 178th Street

Viewshed 4 has single-family residential neighborhoods on both sides of I-5. Ridgecrest Park is on the east side of I-5 and is partially screened from the freeway by a row of trees. Three parks on the west side of I-5 (Twin Ponds Park, James Keough Park, and Ronald Bog Park) do not have views extending to the east side of I-5. King County Metro's North Transit Base and King County's Solid Waste Transfer Station are on the west side of the freeway. The visual quality of the residential area is medium due to the visual unity of its homogenous character and moderately dense landscaping that buffers views of I-5. The visual quality of Ridgecrest Park is high due to vegetation screening from I-5. With vegetation framing both sides of I-5, the visual quality of the freeway is medium. There are WSDOT beautification areas located southeast and northwest of the NE 175th Street interchange.

Segment A, Viewshed 5—NE 178th Street to NE 190th Street

Viewshed 5 has single-family residential uses on both sides of I-5, along with churches and other uses, such as the Shoreline Conference Center and Shoreline

Stadium and a Seattle City Light transmission line corridor. This section of I-5 is bordered by noise walls, with varied vegetation. Residential areas in this viewshed have high viewer sensitivity and medium visual quality due to the unity of character and the buffering of the freeway by noise walls and vegetation. Viewers from the Shoreline Conference Center and the Shoreline Stadium are likely to have a low level of sensitivity if their focus is on other activities; moreover, the variety of urban forms generally lowers visual quality. Drivers and occupants of vehicles on I-5 are likely to have average sensitivity in viewing the medium visual quality of the highway corridor framed by moderately dense vegetation on both sides. There is a WSDOT beautification area south of NE 180th Street.

Segment B, Viewshed 6—NE 190th Street to NE 205th Street (244th Street SW, SR 104)

Viewshed 6 has single-family residential uses on both sides of I-5. North City Park and the closed North City Elementary School on the east side of the highway are separated from I-5 by a beautification area of mature forest. This section of I-5 has high visual quality because of the frame of heavy vegetation on both sides. The residential areas have high viewer sensitivity and medium visual quality and are buffered from the freeway by noise walls, topography, and distance.

Segment B, Viewshed 7—NE 205th Street (244th Street SW) to Mountlake Terrace Transit Center (232nd Street SW)

Viewshed 7 covers an area where I-5 widens for an interchange and median. Much of this viewshed has medium visual quality, as viewed from I-5, because of the consistent character due to vegetation framing on both sides and the view of vegetation on the horizon despite the complex freeway lanes, interchange ramps, and the parking structure of the Mountlake Terrace Transit Center. The Nile Golf Course is west of I-5, with residential areas located north of 236th Street SW on both sides of I-5. Both of these areas have high visual quality and high viewer sensitivity, with few views of I-5 because of buffering vegetation. The commercial and office area on the east side of the freeway has low to medium viewer sensitivity and medium visual quality due to unity of design. This commercial area is buffered from views of I-5 by a wooded area along McAleer Creek adjacent to I-5. North of this area is a vacant former school site.

Segment B, Viewshed 8—232nd Street SW to 220th Street SW

Viewshed 8 is along I-5 in an area where the freeway has high visual quality for southbound traffic due to very dense vegetation on high steep slopes that border the highway on both sides. For northbound vehicles south of 232nd Street SW, viewer sensitivity is average, and visual quality is medium rather than high because of the encroachment of roadway crossings and the pedestrian overpass to the existing

transit stop in the median. The surrounding single-family residences along both sides of I-5 are at the top of steep wooded slopes and have high viewer sensitivity and medium visual quality with unified character. These residences are buffered from views of I-5 by topography, noise walls, and vegetation, although the residences on 227th Street SW are in a valley with noise walls that only partly screen views of I-5. On the west side of I-5 from about 233rd Street SW to just south of 228th Street SW, a highway beautification area extends along the top of the densely vegetated slope.

Segment B, Viewshed 9—220th Street SW to 212th Street SW

Viewshed 9 is along a section of I-5 that is bordered by moderate to dense vegetation on either side, with medium visual quality. The bordering neighborhoods are mostly residential, are generally below the elevation of I-5, and have medium visual quality due to unity of character. These neighborhoods are buffered from I-5 by topography, noise walls, and vegetation. Offices and a multi-family residential complex on the west side of I-5 between 220th Street SW and 216th Street SW, have low to medium visual quality due to the similar character of built elements, landscaping, and street character.

Segment C, Viewshed 10—212th Street SW to 40th Avenue West

Viewshed 10 has varied landscapes as the alternative routes move away from I-5 to the Lynnwood Transit Center. Viewer sensitivity varies as well due to the mix of viewer types.

Northbound on I-5, between 212th Street SW and 52nd Avenue West has high visual quality with vivid distant views of the Cascade Mountain peaks. Northbound and southbound views are framed by moderately dense vegetation.

West of I-5 between 212th Street SW and 52nd Avenue West is a residential area with a large open space area and a lake that has medium visual quality due to the blend of open space and residential uses.

To the west of I-5, 52nd Avenue West is characterized by a residential neighborhood on the west side, with medium visual quality due to a unity of features. The industrial uses to the east of 52nd Avenue West are not a visual intrusion to the residential area due to the low profile of buildings as well as landscaping and parking areas adjacent to the street.

Scriber Creek Park on the east side of Cedar Valley Road approaching 200th Street SW has high visual quality due to the diversity of lawn areas, wetlands, and trails and the unifying homogeneous dense vegetation throughout the area. This vegetation also buffers the park from the street and adjacent urban development.

The areas on both sides of 200th Street SW east of Cedar Valley Road include multifamily buildings and offices that transition to commercial uses east of 46th Avenue West. The multifamily residential neighborhood has medium visual quality due to a unity of bulk, design, and landscaping elements that provide compatible features. The commercial areas east of 46th Avenue West have low visual quality due to the variety of building forms and the lack of visual harmony among multiple building styles and other features.

The Lynnwood Transit Center occupies a 29-acre site with pick-up and drop-off areas and several large parking lots. The transit center is bounded to the west by a large tract with wetlands adjacent to Scriber Creek. The visual quality of the transit center is low due to the predominance of parking lots, despite landscaping features and the adjacent open space area.

The 44th Avenue West corridor south of 200th Street SW includes commercial development with the Lynnwood Transit Center on the west side and a variety of commercial development on the east side. The dominant visual image is of wide streets, large parking lots, signs, and strip shopping centers. The visual quality for viewers within the commercial area is medium to low due to lack of unity. The visual quality for occupants of vehicles traveling north on the arterial is generally low because of the multiple overcrossings by I-5 and the Interurban Trail, the freeway on-ramps and adjacent parking lots, frequent signs, and strip malls with little visual interest.

The Interurban Trail crosses 52nd Avenue West and runs northeast toward the Lynnwood Transit Center, with the Scriber Creek wetlands and the Lynnwood Transit Center to the north, before it continues to cross 44th Avenue West on an overpass near I-5. The trail is bounded by moderate to dense vegetation and has a medium visual quality due to the unity of vegetation cover along the corridor.

4.5.2 Long-Term Impacts

The discussion below describes the potential visual changes that could occur with the light rail alternatives compared to the No Build Alternative, and qualitatively assesses the level of visual change and the resulting visual quality for each viewshed. To develop the visual assessments in this section, Sound Transit prepared visual simulations that are based on photographs of existing views from locations throughout the project corridor; these simulations are provided in Appendix G.

No Build Alternative

Under the No Build Alternative, the visual quality of the project corridor would be similar to that discussed above under Section 4.5.1, Affected Environment. If the I-5 corridor experiences more adjacent private development, the visual environment in the viewsheds could change over time.

Light Rail Alternatives

The Lynnwood Link Extension would result in changes in the visual environment of varying degrees throughout the project corridor, as discussed in more detail in the following subsections. Consistent with Sound Transit design guidelines, and where practical, the project would incorporate the following features to reduce and avoid visual impacts as much as possible:

- On the east side of I-5, the project would, in some locations, place the light rail guideway on the freeway side of the wall and move existing noise walls farther east, and increase their height. In other areas, the light rail guideway would be placed east of the existing noise wall and would include separate noise walls. Areas with slopes may need new retaining walls as well as relocated or new noise walls.
- New noise walls would also be needed in some cases to mitigate light rail noise impacts. Walls could be either on or adjacent to the guideway.
- Exterior lighting at stations and park-and-ride lots would be designed to minimize height and use source shielding to avoid luminaries (bulbs) that would be directly visible from residential areas, streets, and highways. Shielding would also limit spillover light and glare in residential areas.
- For the entire Lynnwood Link Extension, Sound Transit would develop design criteria that would guide project design through a balanced set of systemwide elements and contextual elements, such as a consistent architectural theme for elevated elements and stations, consistent signage, and a systemwide art program. These criteria would be developed by interdisciplinary teams with input from local communities, local jurisdictions, and WSDOT, and would be integrated with existing plans, including plans for redevelopment.
- Sound Transit would adhere to the Cities' design standards and design review process, if applicable, to promote visual unity in station areas.
- Sound Transit would plant appropriate vegetation within and adjoining the project right-of-way to replace existing street trees and other visually important vegetation that is removed for the project, and/or to provide screening for sensitive visual environments and/or sensitive viewers.
- Sound Transit would maintain remainder parcels (purchased parcels that are unused after the project) to pursue their redevelopment consistent with city plans.

Changes in visual quality can result when defining features, including mature trees and landscaping, are removed or when prominent features such as walls, stations, elevated guideways, or larger structures are added. Visual changes also occur where overhead utilities are added or raised, or where streets, bridges, or other facilities are modified or

replaced. Elevated sections of the guideway would be prominent aboveground features when viewed by traffic users on I-5 and viewers in the surrounding area. When mature vegetation framing the roadway is removed, viewers may perceive the highway corridor as wider and more prominent, and it can change the visual context of adjacent residential areas by removing the buffer from the transportation corridor.

The changes in visual quality by location are described in Table 4.5-1. Visual simulations in Appendix G illustrate existing views and projected future views with the light rail alternatives.

Visual impacts are rated as low, medium, or high, reflecting the degree of change, the quality of the views, and the sensitivity of viewers. The following criteria are used to characterize the degree of visual quality change from existing conditions in terms of changes in the elements of vividness, intactness, and unity as well as viewer sensitivity.

- **High change** would remove existing features and/or introduce visually prominent features that alter the visual character of the area. High changes include removing dense mature vegetation that contributes to high or moderately high visual quality or when vegetation provides effective screening of less attractive views. High changes may also include prominent structures that are larger in scale or higher than surrounding visual features, including views of trains passing by. A high degree of change is more likely in an area with high visual quality and high viewer sensitivity.
- **Medium change** would alter visual features but not in a way that would be perceived as intrusive or incompatible by most viewers and would not substantially change intactness and visual unity. A medium change can result from the removal of vegetation that would not affect the extent to which highway or light rail features are screened or buffered or that renders features more visible or prominent.
- **Low change** generally includes relatively minor new features or relatively minor alteration of existing features such as vegetation cover. Replacing noise walls with similar-scale walls, and/or the inclusion of light rail facilities, would result in minor changes in intactness and visual unity. In some cases, physically prominent new features might result in a low change in visual quality if the existing visual context already has low visual quality.

Impacts by Alternative

Table 4.5-1 summarizes the potential visual impacts by segment and alternative, while Figures 4.5-2 to 4.5-7 highlight areas with high impacts.

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
1. Northgate (NE 92nd Street to NE 115th Street)	Low	Average	**All Alternatives:** • The elevation of I-5 and the topography currently limits visibility from surrounding areas, and the elevated structure would cause little or no change in appearance or visual unity of the highway corridor. • Views of Northgate Mall from I-5 would not be impaired because the elevated structure would be at a similar elevation as the parking lot tree canopy and would maintain similar views of buildings and signage, with little change in visual unity. • Few areas with mature dense vegetation would be removed, although some landscaping would be removed along 1st Avenue NE to NE 115th Street, resulting in a localized impact, with new facilities visually encroaching and reducing visual unity. • The elevated structure would be a visually prominent element but would not affect any vivid and memorable features or views, nor would it reduce the limited unity in this complex and heterogeneous area. • Elevated structures would partly encroach on views from residential neighborhoods to the east.	G-5 G-7 G-8 G-9 G-10	**I-5** Low **Retail/Office** Low **Residential** Low and High
			Preferred Alternative and Alternatives A5 and A10: • Impacts would be the same as described above under All Alternatives to N. 113th Street. • Existing dense landscaping between a multi-family site and First Avenue N. would be replaced by a guideway on retaining walls about 30 feet high, with a high localized visual impact due to encroachment and reduced visual unity.	G-7 G-10	**I-5** Low **Residential** Low except High for one adjacent multi-family complex
			Alternatives A3, A7, and A11: • Impacts would be the same as described above under All Alternatives to N. 113th Street. • Continuation of the elevated guideway to the north would result in a high localized visual impact due to encroachment and reduced visual unity.	G-9	**I-5** Low **Residential** High

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
2. NE 115th Street to NE 133rd Street	**I-5** Low **Residential** Medium	**I-5** Average **Residential** High	**Preferred Alternative and Alternative A1 (at-grade/elevated with no station at NE 130th Street):** • The noise wall would be relocated to the east and would be similar in scale from 117th Street to near NE 123rd Street, with low visual quality impacts to viewers from I-5. • Displaced homes and higher noise walls from NE 117th Street to NE 123rd Street would affect the unity of views from nearby residences and a church to the east. Local views would vary according to retaining wall and noise wall height and the distance between walls and residences. The greatest visual intrusion would be where noise walls are within existing back yards of residences. • Removal of buildings, street relocation, complex noise wall configuration, and loss of vegetation between NE 123rd Street and NE 130th Street would be a visual encroachment and reduce visual unity and intactness for residential areas to the east. • Loss of dense vegetation north of NE 130th Street would reduce the unity of views both from I-5 and neighborhoods to the east. • Views from residential neighborhoods to the west would not be affected.	G-12 G-13 G-15 G-17 G-18 G-21 G-24 G-29	**I-5** Low **Residential** Medium and High (mostly within 1 block from corridor)
			Alternatives A5, A10 (at-grade alternatives with station at NE 130th Street): • Impacts would be similar to Preferred Alternative and Alternative A1. • The station at NE 130th Street would be largely below grade with little additional change from the visual impacts of vegetation removal in the Preferred Alternative.	G-15 G-17 G-24 G-31	**I-5** Low **Residential** Medium and High (mostly within 1 block from corridor)
			Alternative A3 (mostly elevated with no station at NE 130th Street): • Elevated guideway and overhead catenary south of and at NE 130th Street would reduce intactness and unity of views from I-5 and the residential neighborhood and church to the east. • Removed homes and vegetation would increase the prominence of the highway corridor and affect visual unity for neighborhoods to the east, which currently have views of existing large trees and other landscaping.	G-14 G-19 G-22 G-26 G-30	**I-5** Medium and High **Residential** High (mostly within 1 block from corridor)
			Alternatives A7 and A11 (mostly elevated with NE 130th Street Station): • Impacts would be similar to Alternative A3, except the station at NE 130th Street would be more prominent. • Views of surface parking would be similar to the existing park-and-ride but could be partly screened from the view of residences by landscaping.	G-14 G-19 G-27 G-32	**I-5** Medium and High **Residential** High (mostly within 1 block from corridor)

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
3. NE 133rd Street to NE 152nd Street	**I-5 Northbound** Medium **I-5 Southbound** Medium to High **Residential** Medium **Golf Course** Medium	**I-5** Average **Residential** High **Golf Course** High	**Preferred Alternative (with NE 145th Street Station and parking garage south of relocated ramps):** • The elevated guideway and overhead catenary would remove an existing mature vegetation screen and intrude into views from some residential neighborhoods, reducing intactness and unity; the affected residential areas are mostly on the east side of the freeway. • The elevated guideway above the grade of I-5 travel lanes south of NE 145th Street would remove mature vegetation and alter the character of a heavily vegetated transportation corridor and be a prominent visual intrusion that would reduce unity as viewed from the highway. • The elevated guideway, elevated NE 145th Street Station, and parking garage would not block views of Mount Rainier from I-5 southbound and would not change the vividness of this element in views. • There would be partial views of the guideway from Jackson Park Golf Course to the west, with less screening of views of I-5, but the station and parking garage would not affect the golf course's overall internal visual character or unity. • The guideway, station, and parking garage would eliminate existing mature trees within the existing park-and-ride lot and would intrude into views from the residential areas to the east. The station and parking lot would increase the scale of visual elements as compared to existing residences across the street, reducing visual unity. • North of NE 145th Street, removed residences and vegetation, together with an elevated guideway on 10- to 20-foot-high retaining walls with additional noise walls, would be a visual intrusion and reduce the visual unity of the residential neighborhood.	G-34 G-37 G-40 G-43 G-48 G-53 G-56 G-59	**I-5** Medium **Residential** Medium and High (in vicinity of NE 145th Street) **Golf Course** Medium
			Alternatives A1 and A10 (with NE 145th Street Station and parking garage adjacent to NE 148th Street): • Impacts of the elevated guideway and station would be the same as the Preferred Alternative on views from I-5, residential neighborhoods, and Jackson Park Golf Course. • The parking garage adjacent to NE 148th Street would displace residences, eliminate existing mature trees, and be a visual intrusion into the adjacent residential neighborhood that would alter the scale of visual elements and reduce visual unity.	G-34 G-37 G-41 G-44 G-49 G-54 G-57	Same as the Preferred Alternative
			Alternative A5 (without station at NE 145th Street): • Impacts from the elevated guideway would be similar to the Preferred Alternative but with lower effects on intactness and unity near NE 145th Street because there would be no station or garage.	G-35 G-37 G-45 G-61	Same as A1, A10 except: **Residential** Medium

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
			Elevated Alternatives A3 and A11 (with station at NE 145th Street): • The guideway and overhead catenary would be higher and intrude into views more than the Preferred Alternative, affecting visual intactness and unity for views from neighborhoods on both sides of I-5. • The elevated guideway above the grade of I-5 travel lanes south of NE 145th Street would remove mature vegetation, alter the character of a heavily vegetated transportation corridor, and be a prominent visual intrusion that would reduce unity as viewed from the highway. • There would be no impacts to views of Mount Rainier from I-5 southbound. • Effects of the NE 145th Street Station would be similar to the Preferred Alternative. • The higher guideway and station would be more prominent in views from much of Jackson Park Golf Course than the Preferred Alternative, with greater effects on westerly views from the golf course. • North of NE 145th Street, the elevated guideway would intrude on views and reduce the visual unity of the residential neighborhood to the east. • The higher elevated structure would be visible and perceived as a visual intrusion from the residences and school west of I-5 despite existing vegetation screening.	G-35 G-38 G-40 G-43 G-50 G-60	**I-5** High **Golf Course** Medium and High **Residential** High
			Elevated Alternative A7 (without station at NE 145th Street): • Visual impacts would be similar to Alternative A3 due to the elevated guideway height, but with less prominent and less visual intrusion in the vicinity of NE 145th Street because there would be no station or parking garage.	G-35 G-38 G-46 G-51 G-62	Same as A-3 except **Residential** Medium (in vicinity of NE 145th Street without station and garage)
4. NE 152nd Street to NE 178th Street	**I-5** Medium **Residential** Medium	**I-5** Average **Residential** High	**Preferred Alternative and Alternatives A1, A3, A10, and A11 (alternatives without station at NE 155th Street):** • Between NE 152nd and NE 178th streets, light rail facilities on retained fill structures with noise walls would intrude into views from I-5 and reduce visual unity, largely by removing the moderate to dense vegetation along the highway. • In addition to vegetation loss, some homes would be removed, and new retaining walls and noise walls would be higher than existing walls and would be a visual intrusion and reduce unity and visual integrity for residential areas to the east. These effects would be greatest between NE 152nd and NE 161st Streets. • A row of trees along the east side of Ridgecrest Park would be removed, reducing the intactness and unity of views from the park and residences directly to the east. • From Ridgecrest Park to NE 170th Street, the light rail facilities would not be visible from residential areas to the east, but unity of views from the neighborhood to the highway would be affected by the loss of mature vegetation. • Five to 10 percent of a 0.5-acre WSDOT beautification area southeast of the NE 175th Street interchange would be used by these alternatives.	G-66 G-68 G-70 G-72	**I-5** Medium **Residential** Medium and High (mostly for residences with direct views) **Ridgecrest Park** High

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
			Alternatives A5 and A7 (alternatives with station at NE 155th Street): • Impacts would be similar to the Preferred Alternative, except at the NE 155th Street Station and its garage, which would displace residences and be at a greater scale than surrounding residences. This would reduce the visual unity of the adjacent residential neighborhood and intrude on views.	G-64 G-68 G-70 G-72	**I-5** Medium **Residential** Medium and High (mostly for residences with direct views)
5. NE 178th Street to NE 190th Street	**I-5** Medium **I-5** **Residential** Medium	**I-5** Average **Residential** High	**Preferred Alternative** • Loss of moderate to heavy vegetation cover, the placement of retaining walls, and a parking garage adjacent to the highway would reduce visual unity for travelers on I-5. • Removal of homes, loss of vegetation along I-5, relocated noise walls, and realignment of 5th Avenue NE would reduce visual integrity and unity for residential neighborhoods to the east, including where views of noise walls are now buffered by vegetation. • The light rail guideway and station at NE 185th Street would mostly be lower than the residential neighborhood to the west, but parts of the station and its transit facilities would be visible. This change, as well as the removal of some homes to the east of the station, would reduce the visual unity of the residential area. • The parking structure on the west side of I-5 would remove vegetation, but would not change the visual context for views from the west given the existing stadium, surface parking, and topography. The parking structure would be partly visible from the north but would be less visible from the residential area to the east. • About 20 to 30 percent of a 0.67-acre WSDOT beautification area south of NE 180th Street would be occupied by light rail facilities, reducing mature vegetation along the highway and reducing visual unity.	G-74 G-81 G-86 G-92 G-94	**I-5** Medium and High **Residential** Medium and High
			Preferred Alternative—NE 185th Street Station with Shoreline Stadium Garage Option: • Impacts to viewers on I-5 from loss of moderate to heavy vegetation cover and the placement of retaining walls near travel lanes would be the same as with the Preferred Alternative. • Visual impacts of the scale of the parking garage adjacent to I-5 southbound lanes would be avoided by this garage location, with less loss of vegetation and greater visual unity for travelers on I-5. • The parking structure on the stadium parking site on the west side of I-5 would moderately reduce visual integrity and unity of the residential neighborhood because of the scale of the building; however, the impacts would be reduced by the current context with the large-scale stadium to the north, which is higher and more prominent. • Impacts to residential neighborhoods to the east would be the same as with the Preferred Alternative.	G-87 G-90	**I-5** Medium in vicinity of NE 185th **Residential** Medium (west side in vicinity of garage)
			Alternative A1 (at-grade alternative): • Impacts would be similar to the Preferred Alternative except between NE 182nd Street and NE 188th Street, where the route is closer to I-5, resulting in more loss of mature vegetation adjacent to the highway.	G-75 G-82 G-95	**I-5** Medium and High **Residential** Medium and High

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
			Alternatives A5 and A10 (at-grade alternatives): • The guideway elements would be similar to the Preferred Alternative, with similar impacts. • The NE 185th Street Station Option 3 (at-grade) would have the at-grade station and platform similar in visibility to Alternative A1, but parking and access features would remove residences and vegetation to the east, covering about a block, with additional surface parking on the Seattle City Light parcel. These features would alter the visual intactness and unity of the residential neighborhood.	G-77 G-79 G-84 G-97	**I-5** Medium and High **Residential** Medium and High
			Alternatives A3, A7, and A11 (elevated alternatives): • The elevated alternatives would displace existing vegetation along the corridor and introduce a prominent elevated structure into views from I-5, intruding on views and reducing visual unity for the corridor that is now framed by mature vegetation. • Removal of homes, loss of mature vegetation, the elevated structure, and replacement of noise walls would affect visual unity for the first blocks of the adjacent residential neighborhoods to the east and south. • The parking structure east of I-5 would displace homes, remove vegetation, and be of greater scale than the homes in the neighborhood, reducing visual integrity and unity.	G-76 G-83 G-88 G-96	**I-5** Medium and High **Residential** Medium and High (mostly within 1 block from corridor)

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
SEGMENT B ALTERNATIVES					
6. NE 190th Street to NE 205th Street (244th Street SW, SR 104)	**I-5** High **Residential** Medium	**I-5** Average **Residential** High	**Preferred Alternative and all Segment B alternatives:** • The removal of mature vegetation within existing cut slopes, the placement of retaining walls, and an elevated guideway north of NE 201st Street would reduce the visual unity of the existing corridor as viewed from I-5, where some views are now framed by wide areas of mature vegetation. • The at-grade portion of the alignment to about NE 201st Street would partly displace vegetation, but this would not alter the visual integrity and unity of adjacent residential neighborhoods to the east because views would be blocked by the existing noise walls.	G-100	**I-5** Medium and High **Residential** Low and Medium
7. NE 205th Street (244th Street SW) to Mountlake Terrace Transit Center (232nd Street SW)	**I-5** Medium **Residential** High **Commercial** Medium **Transit Center** Low	**I-5** Average **Residential** High **Commercial** Average **Transit Center** Low	**Preferred Alternative and Alternatives B1 and B2A:** • The elevated guideway would be in the periphery of views from I-5 in an interchange area with a wide expanse of pavement and complex traffic movements. It would retain some framing vegetation, reducing visual intrusion and maintaining unity for highway travelers. • The elevated structure would be prominent in views from commercial and office areas to the east, but would be largely screened by mature vegetation near McAleer Creek and would not intrude on views or reduce visual unity. • Residents to the east would not have views of the facility because of dense vegetation on the steep slope on the west side of the neighborhood; there would be no visual intrusion or reduced unity. • Similarly, views of the elevated structure from the Nile Golf Course west of I-5 would be limited and distant, with no visual intrusion or reduced unity. • The elevated structure would be noticeable but consistent with the scale, character, and visual diversity of the existing transit center.	G-102 G-105	**I-5** High **Residential** Low **Commercial** Low **Transit Center** Low
			Alternative B4: • The character of the elevated guideway would be similar to the Preferred Alternative, but the guideway would be higher and would cross to the I-5 median south of 236th Street SW. The crossing of northbound lanes would reduce the field of view from I-5; the elevated guideway and supports would cast shadows on the highway below and bring moving trains into the visual field in front of and above vehicles. The extent of perceived intrusion would be reduced somewhat by the existing context of highway overcrossings at the 236th Street SW and the pedestrian bridge to the transit center. • Visual impacts from viewpoints on either side of I-5 would be similar to other alternatives south of 238th Street SW, but the median alignment would reduce some impacts because it would involve less clearing of existing vegetation.	G-103 G106	**I-5** Medium **Residential** Low **Commercial** Low **Transit Center** Low

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
8. 232nd Street SW to 220th Street SW	**I-5 Northbound** Medium to High **I-5 Southbound** High **Residential** Medium	**I-5** Average **Residential** High	**Preferred Alternative:** • North of the existing Mountlake Terrace Transit Center, the elevated guideway passing through a forested area on the east side of I-5 before crossing over the highway would be directly in the westerly view from several residences on 233rd Place SW; these residences currently have a view of mature trees. The guideway would intrude on views and reduce visual unity for these residences, resulting in a high visual impact. • The crossing over I-5 with an elevated guideway and associated support structures would be prominent in the views from I-5 in both directions and would cast shadows on the highway below and bring moving trains into the visual field in front of and above vehicles; this would intrude on views from the highway and reduce visual unity. • The clearing of existing dense vegetation on the lower portion of the slope on the west side of I-5 would change the forested character of the corridor. The loss of vegetation and the introduction of rail facilities and retaining walls would reduce the integrity and unity of views, especially for I-5 southbound. • The clearing of existing mature vegetation at the 220th Street SW interchange and the introduction of an overhead guideway would be a visual intrusion and reduce the integrity and unity of views. • There would be no impacts to views from residential areas to the west of I-5, south of 233rd Place SW, or on the east side of I-5, north of 233rd Place SW. • North of 223rd Place, the guideway would be above the elevation of the residential areas to the west, intruding on views.	G-108 G-112	**I-5** High **Residential** Low, but with some localized High
			Preferred Alternative with 220th Street SW Station Option: • Impacts would be the same as the Preferred Alternative south of 225th Place. • The option shifts the alignment to the west, displacing several residences and placing the station on a former school site (now vacant). It would be prominent in views from nearby residential areas to the west and would intrude on views and reduce visual unity.		**I-5** High **Residential** Medium (with localized high)
			Alternative B2A: • Impacts would be the same as the Preferred Alternative south of 223rd Place. Alternative B2A's 220th Street SW Station would be prominent in views from nearby residential areas to the west, and would be a high impact. The station would be visible from the commercial area to the west and northwest but would be less of a visual intrusion given the array of commercial buildings and major transportation facilities.	G-120a G-120b	**I-5** High **Residential** Medium (with localized high)

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
			Alternative B1: • North of the existing Mountlake Terrace Transit Center, the elevated guideway would pass through a forested area on the east side of the highway before crossing over to the I-5 median and crossing over the highway, with the same impacts as the Preferred Alternative on residences at 233rd Place SW. • At the crossover to the I-5 median, the views from I-5 northbound would include the elevated guideway and associated supports that would cast complex shadows on the highway below and bring moving trains into the visual field in front of and above vehicles. The perception of visual intrusion would be reduced somewhat by the existing highway overcrossings at 236th Street SW and the pedestrian bridge to the transit center. • Views from I-5 southbound would include the guideway in the median as an element similar to the existing transit stop. The mature native vegetation on the west side of the corridor would remain undisturbed. • There would be no impacts to views from residential areas to the west or on the east side north of 233rd Place NE because views are limited by trees and noise walls.	G-109 G-113 G-116 G-118	**I-5** Medium **Residential** Low, but with some localized High
			Alternative B4: • The guideway and station in the I-5 median would remove existing vegetation and add an additional transportation facility but would cause little change in the character of views from I-5 as a transportation corridor. • The additional pedestrian bridge crossing to the east at the north end of the Mountlake Terrace Freeway Station would displace some vegetation and alter the perception of the continuity of I-5. The existing context limits the effects of view encroachment because bridges, pedestrian overcrossings, and the Mountlake Terrace Transit Center already create a visually diverse setting. • The light rail facilities in the I-5 median would not be visible from residential areas.	G-110 G-114	**I-5** Medium **Residential** Low

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
9. 220th Street SW to 212th Street SW	**I-5** Medium **Commercial, Office, Multi-Family** Low and Medium **Residential** Medium	**I-5** Average **Residential** High	**Preferred Alternative and Alternative B2A:** • The light rail facility on the west side of I-5 on retained fill with noise walls would displace moderate to dense vegetation, altering the context of the linear transportation corridor as seen from I-5. This would be an encroaching element at variance with the existing frame of vegetation on both sides of the corridor and would reduce unity. • The retaining walls and noise walls would replace dense vegetation in views from residential areas to the west. This would result in a greater degree of perception of the transportation corridor encroaching on the visual unity of the existing neighborhood, which is generally buffered by vegetation from views of the freeway.	G-122	**I-5** Medium **Commercial** Low **Residential** Medium
			Preferred Alternative with Station Option at 220th Street SW, Alternative B2A: • Impacts would be the same as the Preferred Alternative except that the optional station would remove additional mature vegetation, and be a more prominent visual intrusion that would reduce the integrity and unity of views, especially for I-5 southbound. • The 220th Street SW Station would be prominent in views from the commercial area to the west and northwest but would not be a visual intrusion given the existing visual character of the area.	G-123	**I-5** Medium **Commercial** Low **Residential** Medium
			Alternatives B1 and B4 (alternatives with I-5 median alignment): • The elevated guideway in the I-5 median would cause little change in the character of views from I-5; it would displace sparse vegetation in the median and add an additional transportation facility, but likely would not be perceived by users of I-5 as out of character or an encroaching element to the transportation corridor. • The light rail facilities in the median would not be visible from residential areas.		**I-5** Medium **Commercial** Low **Residential** Low

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

SEGMENT C ALTERNATIVES					
10. I-5/212th Street SW to 44th Avenue West	**I-5** Medium **Residential** Medium **Industrial** Low **Interurban Trail** Medium **Transit Center** Low	**I-5** Average **Residential** High **Industrial** Low **Interurban Trail** High **Transit Center** Low	**Preferred Alternative:** • The light rail facility on the west side of I-5 on an elevated guideway would displace moderate to dense vegetation from 212th Street SW to 48th Avenue West, altering the context of the linear transportation corridor as seen from I-5. This would be an encroaching element at variance with the existing frame of vegetation on both sides of the corridor and would reduce unity. • For the guideway location on the west side of I-5, loss of dense vegetation would affect views for part of the Hall Lake residential area, and the increased prominence of I-5 and light rail together would affect visual unity for the existing open space and single-family neighborhood. • The elevated guideway would cross an existing industrial site devoted primarily to storage and the vacant site of a future school district maintenance facility, and would be a prominent feature with little visual impact, given the low visual interest of the existing and proposed facilities. • The elevated guideway would cross the Interurban Trail diagonally near the existing Lynnwood Transit Center, remove a moderate to dense margin of trees, and add a prominent feature visible to trail users. In the context of an urban trail with many street crossings and a transit overcrossing to the north, bounded by varied landscapes (including the adjacent transit center parking lot), the additional crossing would intrude in an area with moderate visual unity. • The elevated guideway and station in the middle of the Lynnwood Transit Center, with a parking structure to south, would be prominent features in relation to the low scale of existing transit facilities and parking, but would not alter the integrity and unity of the landscape because of the low visual interest of the parking lots and existing transit center.	G-125 G-128 G-131 G-135	**I-5** Medium **Residential** High **Industrial** Low **Interurban Trail** Medium **Transit Center** Low
			Preferred Alternative (Median Option) • Crossing from the median to 52nd Avenue West would partially obscure northbound views of mountain peaks in the distance, but the short duration of obstruction likely would not be perceived as changing the visual context with the almost continuous views of mountain peaks available for several miles. • All other impacts the same as the Preferred Alternative.	G-126 G-129	**I-5** Medium **Residential** Low **Industrial** Low **Interurban Trail** Medium **Transit Center** Low

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
I-5/212th Street SW to 52nd Avenue West	**I-5** Medium **Residential** Medium	**I-5** Average **Residential** High	**Preferred Alternative and Alternative C3 (west side of I-5 to Lynnwood Park-and-Ride):** • Loss of moderate to dense vegetation would change the visual context from I-5. • Loss of dense vegetation would affect views for part of the Hall Lake residential area, and the increased prominence of I-5 and light rail together would affect visual unity for the existing open space and single-family neighborhood. • Residences or commercial uses on the east side of I-5 would be screened by dense vegetation, except at street overcrossings.	G-127 G-135	**I-5** Medium **Residential Hall Lake Vicinity** High **Industrial** Low
			Alternatives C1 and C2 (I-5 median): • Crossing from the I-5 median to 52nd Avenue West would partially obscure northbound views of mountain peaks in the distance, but the short duration of obstruction likely would not be perceived as changing the visual context with the almost continuous views of mountain peaks available for several miles. • The light rail facilities would not be prominent from residences or commercial uses on the east side of I-5 due to screening by dense vegetation, but the elevated crossover structure would become prominent for viewers on the west side when aligned with 52nd Avenue West.	G-132 G-136	**I-5** Medium **Residential** High
			Alternatives C1 and C2 (west side of I-5): • Some loss of moderate to dense vegetation would occur, changing the visual context from I-5. • Loss of dense vegetation would affect views for part of the Hall Lake residential area, and the increased prominence of I-5 and light rail together would affect visual unity for the existing open space and single-family neighborhood. • Residences or commercial uses on the east side of I-5 would be screened by dense vegetation, but the structure crossing over I-5 lanes to 52nd Avenue West would be prominent for residential areas to the west.	G-133 G-136	**I-5** Medium **Residential** High
West side of 52nd Avenue West	**Residential** Medium	**Residential** High	**Alternatives C1 and C2 (elevated on the east side of 52nd Avenue West):** • The elevated guideway on the east side of 52nd Avenue West would visually intrude upon the integrity and unity of this residential area.	G-136	**Residential** High
			Preferred Alternative and Alternative C3 (along I-5 to Lynnwood Park-and-Ride): • No light rail facilities would be in this area; therefore, there would be no visual quality impacts.		N/A
East side of 52nd Avenue West	**Commercial/ Industrial** Low	**Commercial/ Industrial** Low	**Alternatives C1 and C2 (elevated on the east side of 52nd Avenue West):** • The elevated guideway on the east side of 52nd Avenue West would be taller and more prominent than the existing street frontage, but impacts would be lower given the lower sensitivity of users in this light industrial area.	G-136	**Commercial/ Industrial** Low and Medium
			Preferred Alternative and Alternative C3 (along I-5 to Lynnwood Park-and-Ride): • No light rail facilities would be in this area; therefore there would be no visual quality impacts in this area.		N/A

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
Scriber Creek Park	High	High	**Alternatives C1:** • The elevated guideway would cross along the west side and across the north section of Scriber Creek Park, with loss of mature vegetation and a visual intrusion. This would reduce the existing high visual unity of the park for users.	G-138 G-140	High
			Alternative C2: • The elevated guideway in the wetland area immediately south of Scriber Creek Park would displace mature vegetation and be perceived as visual intrusion and reduced unity of views for trail users at the southern boundary and from the multifamily residential properties north of the park.	G-144 G-146	High
			Preferred Alternative and Alternative C3: • No light rail facilities would be in this area; therefore there would be no visual quality impacts in this area.		N/A
200th Street SW Cedar Valley Road to 44th Avenue West	**Multifamily** Medium **Commercial** Low	**Residential** High **Commercial** Average	**Alternative C1:** • The elevated guideway and station on the south side of 200th Street SW would be larger than existing buildings. It would encroach on the visual integrity and unity of the area, and intrude on views of the streetscape for pedestrians and occupants of vehicles. • The multistory parking garage would replace smaller-scale office buildings. • Visual encroachment would likely be perceived as less approaching 44th Avenue West because of lower visual unity in the commercial area.	G-150 G-142	**Multifamily** High **Commercial** Medium
			Preferred Alternative and Alternatives C2 and C3: • No light rail facilities would be in this area; therefore there would be no visual quality impacts in this area.		N/A
Interurban Trail and Scriber Creek Wetland	Medium	High	**Preferred Alternative and Alternative C3:** • The elevated guideway would cross the Interurban Trail diagonally near the existing Lynnwood Transit Center, remove a moderate to dense margin of trees, and add a prominent feature visible to trail users. The guideway would also cross the trail near 44th Avenue West and remove some vegetation that functions as a buffer. • In the context of an urban trail with many street crossings and a transit overcrossing to the north, bounded by varied landscapes (including the adjacent transit center parking lot), the additional crossing would be a slight visual intrusion in an area with moderate visual unity. • The elevated crossing of the Scriber Creek wetland would remove vegetation at support structures and require vegetation maintenance beneath the elevated guideway that would alter the existing natural character of the area with moderate change in visual quality, given the context in which the wetland is surrounded by industrial and transit center uses.	G-148 G-154	Medium

Table 4.5-1. Summary of Potential Visual Quality Impacts of the Light Rail Alternatives

Viewshed	Existing Visual Quality	Viewer Sensitivity	Changes in Landscape Elements	Figure in Appendix G	Visual Impact
			Alternatives C1 and C2: • Light rail facilities would cross over the Interurban Trail on the east side of 52nd Avenue West and remove some vegetation. In the context of an urban trail with a street crossing to the south, a transit overcrossing to the north, and varied adjacent uses including industrial, vacant, and transit center parking, the effect would be a slight visual intrusion in an area with limited visual unity. • The guideway would also cross the trail near 44th Avenue West and remove some vegetation that functions as a buffer.	G-155 G-156	Medium
Lynnwood Transit Center	Low	Low	**Preferred Alternative and Alternatives C2 and C3:** • The elevated guideway and station in the middle of the Lynnwood Transit Center, with a parking structure to the south, would be prominent features in relation to the low scale of existing transit facilities and parking, but would not alter the integrity and unity of the landscape because of the low visual interest of the parking lots and existing transit center. **Alternative C1:** • There would be no visual quality impacts in this area.		Low NA
44th Avenue West corridor	Medium to Low	Average to Low	**Preferred Alternative:** • The elevated station within the transit center with the elevated tail track crossing 44th Avenue West east of 220th Street SW would add a third crossing over the street, which the City of Lynnwood considers a gateway to the city center; however, it would not change the visual character of the street, which features other prominent transportation infrastructure elements and has a low level of visual unity.	G-152	Low
			Alternative C1: • The elevated guideway extending to 44th Avenue West would be a prominent new element in a diverse landscape but would not be an intrusion due to the low level of visual unity of this area.		Low
			Alternatives C2 and C3: • The elevated guideway and station with the tail track crossing 44th Avenue West on the general alignment of 202nd Street SW would add a third crossing over the street, which the City of Lynnwood considers a gateway to the city center; however, it would not change the visual character of the street, which features other prominent transportation infrastructure elements.	G-150	Low

Figure 4.5-7
Summary of Visual Impacts
Alternatives C2 and C3

4.5.3 Construction Impacts

Construction impacts would vary by location and the types of construction needed for the different light rail facilities. Construction effects would be temporary but could still last for several years, and they could involve the greatest degree of visual change for the Lynnwood Link Extension. Site clearing and demolition can remove trees, ground cover, and existing structures and affect either a linear corridor or a larger site. Other sources of visual effects include construction staging areas, detours or temporary roadways, lighting, signage, heavy equipment, trailers, fences, temporary noise shielding, scaffolding, cranes, relocation of noise walls, and material storage.

Typically, visual impacts of construction occur in the same areas affected by long-term impacts, but construction has more visual clutter and little visual unity, given the variety of construction activities, equipment, and stored materials that would change throughout the construction period. The construction and staging areas would lack visual cohesion and have low visual quality compared with the existing conditions or the expected visual character after construction.

Construction of the light rail facilities at-grade or associated with retaining walls would have similar temporary visual impacts related to clearing vegetation, exposing and moving soils, constructing retaining walls, installing tracks, an overhead catenary system, and other project features. Elevated portions of the alternative routes would involve less clearing and grading. Columns and guideway sections would be constructed in various ways, ranging from being cast into forms or lifted into place with cranes. Construction access would be primarily from I-5, but adjacent roadways might be used. Light and glare impacts on adjacent areas could occur when nighttime construction is scheduled, which is most likely to take place where construction activities would disrupt I-5 traffic.

4.5.4 Indirect Impacts

Visual impacts for development and/or redevelopment, such as transit-oriented development, might occur in and near stations subject to the comprehensive plans and zoning regulations of local jurisdictions. Even where specific comprehensive plan and zoning regulations are in place, detailed visual analysis depends on the individual developments. However, when stations have available land and supportive zoning in place, there would be more potential for mixed-use development that supports high-density residential, commercial, and office-related uses. Existing properties could be redeveloped with buildings of a larger scale, but at the same time, larger expanses of surface parking could be removed. Landscaping and other visual amenities could also be developed as an integrated part of the new developments.

The station area with the highest potential for visual changes resulting from increased development would be at the Lynnwood Transit Center, based on the City of Lynnwood's plans and policies that encourage growth. The City of Mountlake

Terrace has plans around the Mountlake Terrace Transit Center and the 220th Street SW Station in Mountlake Terrace encouraging transit-oriented development. The City of Shoreline station area plans could also lead to development that would visually change the existing neighborhood. Section 4.2.4 in the Land Use Section (4.2) has a discussion of potential transit-oriented developments near stations.

4.5.5 Cumulative Impacts

The construction of I-5 in the 1960s was a major change to the visual environment in the project corridor, particularly in the neighborhoods that were already in place before the freeway was constructed. The freeway also changed other more natural or rural landscapes. The addition of the light rail alternatives to the project corridor would increase the size and visual prominence of this linear transportation corridor.

While there are no other major new transportation or development projects that run throughout the project corridor, there are sites where further development is anticipated with or without the Lynnwood Link Extension. At Northgate, the Northgate Link Extension is being constructed, and the Northgate Transit Center will be reconstructed. Adopted plans for the Northgate area call for greater mixed-use development throughout the district. Individual redevelopment proposals are expected to replace some of the existing properties with larger-scale, multi-use developments. Such redevelopment at higher densities and height would represent a larger change in views, but would also make the light rail project less prominent because background views would be of more diverse urban forms.

The Mountlake Terrace Transit Center and its multistory parking structure was also recently developed. Areas to the south and east of the station could still be redeveloped consistent with the City of Mountlake Terrace's land use plans, with or without the light rail project. However, light rail, along with other station area developments, could represent a high degree of visual change for this area.

The City of Lynnwood is targeting the city center area for increased development and redevelopment activities over time, which would alter existing visual conditions by redeveloping some existing uses. The likely future continuation of the light rail corridor would affect the character of the city center, but also may contribute to its vitality by providing a wider range of transportation options. All alternative alignments likely would displace some existing development when the light rail route extends farther north. The existing development is largely automobile-oriented with large parking lots. All alternatives would improve transportation access and contribute to the City's goal of focusing increased transit on the city center as the major regional urban center. The City's plan anticipates higher density developments that provide more visual unity, public spaces, and other amenities than the existing facilities.

If built, the OMSF alternative in Lynnwood would alter the existing frontage along 52nd Avenue West, which currently consists of parking with landscaping and low-

profile structures. Views could be changed by the removal of buildings, by changes to landscaped or vegetated areas, and by the introduction of features such as walls or fencing, maintenance buildings, lighting, and overhead catenary. For the Preferred Alternative and Alternative C3, ramps from the elevated guideway to the facility at ground level would provide access from the north, but would have little additional impact on the residential area to the west. With Alternatives C1 and C2, the addition of ramps from the elevated facility to ground level would be an additional element that would contribute to the high visual impact on residences to the west.

The City of Lynnwood's 44th Avenue West, I-5 to 194th Street SW Improvement Project proposes to widen the roadway to seven lanes, with eight lanes just south of 196th Street SW, and wider sidewalks and landscape features. However, the cumulative impacts of this project, in conjunction with the elevated guideway alternatives crossing the 44th Avenue West corridor, would not alter the overall visual context.

The City of Lynnwood's 200th Street SW, 64th Avenue West to 40th Avenue West Project would add lanes, wider sidewalks, landscape features, and bicycle facilities to accommodate future growth envisioned for the city center. This project is unlikely to alter the visual context or increase visual impacts for the light rail alternatives.

4.5.6 Potential Mitigation Measures

Long-Term Impacts

Sound Transit would incorporate specific measures to mitigate visual impacts as it develops the detailed design for the light rail facilities. Mitigation measures would be focused on areas identified as having high visual impacts. They would need to be compatible with the project's maintenance and operations requirements, which include long-term maintenance and safety and security considerations. Because the right-of-way along the project corridor is limited, there would be trade-offs between minimizing right-of-way acquisitions, providing landscaping or other mitigation, and the potential for surplus properties to be made available for redevelopment. Sound Transit's design guidelines would provide direction on how they would approach these trade-offs.

Sound Transit would adhere to jurisdictional permitting requirements, which include tree replacement and landscaping policies that WSDOT and local jurisdictions have in place. For example, within the WSDOT right-of-way, WSDOT specifies a replacement ratio of trees for small, moderate, and mature trees removed. Local jurisdictions have similar policies that would apply outside the right-of-way. The City of Seattle requires replacement trees for each significant tree (≥6-inch diameter at breast height [dbh] caliper) removed. The City of Shoreline requires four trees to be planted for each significant tree removed. The City of Mountlake Terrace requires an Essential Public Facility to retain, to the greatest extent possible, existing

significant trees (that do not constitute a safety hazard). Most of these policies encourage native plantings and younger trees because of higher opportunities for survival and ecosystem integration, compared to attempts to transplant larger and more mature trees, which have lower survival rates.

Even if larger or faster growing trees or plants are used, it may take 15 to 20 years for the plants to grow large enough to screen large facilities such as the overhead catenary wires, multistory parking garages, elevated structures, and tall retaining walls or noise walls. Mitigation for sections with mature evergreen trees could require 30 to 50 years of growth for the replacement trees.

Potential mitigation measures include:

- Sound Transit would prepare a Roadside Master Plan in accordance with WSDOT guidelines for the portion of the route on the I-5 right-of-way.
- For WSDOT's beautification areas along I-5, originally acquired under the Highway Beautification Act of 1965 that are used on this project, Sound Transit would mitigate their conversion to right-of-way with replacement property or with other measures agreed to by WSDOT and FHWA. Replacement parcels will meet the intended function of the original beautification area.
- In areas identified as having high visual impacts, Sound Transit would mitigate with landscaping or visual treatments to retaining walls and other structures, as practical, based on available land, safety, and maintenance and operational needs.

Construction Mitigation

Sound Transit would shield light sources used in nighttime construction to reduce the lighting impacts. Sound Transit would place construction screens or barriers to limit the visibility of work areas that would intrude on adjacent activities, such as public open space, community facilities, and recreational areas and trails, where practical.

4.6 Air Quality and Greenhouse Gases

This section assesses how the Lynnwood Link Extension would affect regional air quality, including greenhouse gas (GHG) emissions. It also reviews potential localized air quality impacts at arterial and local street intersections.

4.6.1 Affected Environment

The project corridor falls within the jurisdiction of the Puget Sound Clean Air Agency (PSCAA) for local air quality regulation.

The topography of the Puget Sound region is characterized by low rolling hills intermingled with a complex maze of interconnected waterways linked to the Pacific

Ocean through the Sound. The region has a mild climate with cool summers and mild, wet, and cloudy winters.

Air Quality Standards and Regulations

Air quality is regulated by federal, state, and local agencies. The air quality analyses for this project followed current guidelines developed by the U.S. Environmental Protection Agency (EPA), the Washington State Department of Ecology (Ecology), PSCAA, and the PSRC.

The Clean Air Act (CAA) is a federal law first passed in 1963. The CAA Amendments of 1990 and the Final Transportation Conformity Rule direct the EPA to implement environmental policies and regulations that will ensure acceptable levels of air quality.

The CAA and the Final Transportation Conformity Rule affect the funding and approval of proposed transportation projects. They require federally approved or funded projects to conform to applicable State Implementation Plans (SIP).

Conformity to an implementation plan means eliminating or reducing the severity and number of violations of the National Ambient Air Quality Standards (NAAQS) and achieving expeditious attainment of such standards.

Under the authority of the CAA, EPA has identified several air pollutants as pollutants of concern nationwide and has established the NAAQS. These pollutants, known as criteria pollutants, are carbon monoxide (CO), particulate matter with a diameter of 10 micrometers or less (PM_{10}), particulate matter with a diameter of 2.5 micrometers or less ($PM_{2.5}$), ozone (O_3), sulfur dioxide (SO_2), lead (Pb), and nitrogen dioxide (NO_2). The NAAQS specify maximum allowable concentrations for these criteria pollutants. The state of Washington and PSCAA have also adopted these standards, in addition to having a standard for total suspended particulates (TSP). Table I-4.6-1 in Appendix I-4.6, Air Quality and Greenhouse Gas, summarizes the standards applicable to transportation projects.

GHG emissions are federally regulated for large industrial sources. Because federal guidance on how to address GHG emissions in environmental documents for other types of sources is currently being developed. Sound Transit is analyzing GHG emissions for this project consistent with best practices and its own policies.

Conformity Requirements

Areas that meet the NAAQS are deemed *attainment areas*. Areas not in compliance with the NAAQS are deemed *nonattainment areas*. Areas that were formerly classified as nonattainment areas but have since demonstrated attainment with the NAAQS are classified as *maintenance areas*. Because the Puget Sound region is a maintenance area for CO, the project must demonstrate conformance with the NAAQS for CO. The region is in an attainment area for all of the other criteria pollutants; therefore,

further conformity analysis of criteria pollutants (SO_2, NO_2, O_3, particulates, and Pb) is not required.

The CAA requires states to develop a State Implementation Plan (SIP) for protecting and maintaining air quality in all areas of the state.

The Lynnwood Link Extension is currently included in PSRC's regional transportation improvement program (RTIP) as project RTA-78, which demonstrates its conformity with the SIP. A project demonstrates project-level conformity by showing that it would not cause or contribute to any new violation of any NAAQS, increase the frequency or severity of any existing NAAQS violations, or delay timely attainment of the NAAQS.

Pollutants of Concern for this Project

Motor vehicles are the largest contributors of air pollution from transportation projects. The main criteria pollutants emitted from motor vehicles are CO, PM_{10}, $PM_{2.5}$, and the O_3 precursors—volatile organic compounds (VOCs) and oxides of nitrogen (NO_X). GHGs and air toxic emissions are also pollutants of concern. This subsection discusses how the main pollutants of concern affect public health and the environment for this project.

Carbon Monoxide

CO is a colorless and odorless gas that interferes with the transfer of oxygen to the brain. It is emitted almost exclusively from the incomplete combustion of fossil fuels. Prolonged exposure to high levels of CO can cause headaches, drowsiness, loss of equilibrium, or heart disease. CO concentrations can vary greatly over relatively short distances. Relatively high concentrations are typically found near congested intersections, along heavily used roadways carrying slow-moving traffic, and in areas where atmospheric dispersion is inhibited by urban "street canyon" conditions. Consequently, CO concentrations are predicted on a localized, or microscale, basis.

Particulate Matter

Particulate pollution is composed of solid particles or liquid droplets that are small enough to remain suspended in the air. Of particular concern are those particles that are smaller than, or equal to, 10 micrometers (PM_{10}) and 2.5 micrometers ($PM_{2.5}$). Particulates can include smoke, soot, dust, salts, acids, and metals. Particulate pollution also forms when gases emitted from motor vehicles react in the atmosphere.

When inhaled, these particles can damage the respiratory tract. Particles 2.5 to 10 micrometers in diameter tend to collect in the upper portion of the respiratory

system, whereas particles 2.5 micrometers or less in diameter are so tiny that they can penetrate deeper into the lungs and damage lung tissue.

Ozone

O_3 is a colorless toxic gas that enters the bloodstream and interferes with the transfer of oxygen. It also damages plants by inhibiting their growth. Although O_3 is not directly emitted, it forms in the atmosphere through a chemical reaction between reactive VOCs and NO_X. O_3 is also produced from industrial sources and automobile emissions.

Greenhouse Gases

Gases that trap heat in the atmosphere are often referred to as GHGs. These gases are necessary because they keep the planet's surface warmer than it would be otherwise. As concentrations of these gases increase, however, the Earth's temperature rises. Vehicles emit a variety of gases during their operation; some of these are GHGs. The GHGs associated with transportation are water vapor, carbon dioxide (CO_2), methane, and nitrous oxide. Nationally, the transportation sector (including on-road vehicles, construction activities, airplanes, and boats) accounts for almost 30 percent of total domestic CO_2 emissions, but in the state of Washington, it accounts for nearly 50 percent of emissions.

Mobile Source Air Toxic Pollutants

Air toxics are pollutants known or suspected to cause cancer or other serious health effects. Most air toxics originate from human sources, including on-road mobile sources, airplanes, and certain kinds of businesses or industries. There are seven priority mobile source air toxic (MSAT) pollutants: acrolein, benzene, 1,3-butadiene, diesel particulate matter plus diesel exhaust organic gases (diesel PM), formaldehyde, naphthalene, and polycyclic organic matter (POM).

Monitored Air Quality Concentrations and Trends

Regional air pollutant trends have generally followed national patterns over the last 20 years. While the average weekday VMT in the Central Puget Sound region has increased from 30 million in 1981 to 80 million in 2009 (PSRC 2010), pollutant emissions associated with transportation sources have decreased. CO is the criteria pollutant most closely tied to transportation. Regionally, the maximum measured CO concentrations have decreased considerably over the past 20 years as a result of greater vehicle fuel efficiency and EPA's national control programs. Other transportation-related pollutants have followed similar but less pronounced trends.

Air quality data were compiled using EPA Air Data (EPA 2014) databases for 2011 to 2013—the latest calendar years for which these data are available. Table 4.6-1 shows the highest recorded ambient air quality levels from representative sites that were monitored for these data and are located within or near the study area. The

monitored concentrations for CO do not exceed national and state ambient air quality standards in the study area.

Table 4.6-1. Monitored Ambient Air Quality Levels

Pollutant	Averaging Time	2011 Maximum Concentration	2012 Maximum Concentration	2013 Maximum Concentration	NAAQS
CO	8 hours	0.9 ppm	0.7 ppm	1.4 ppm	9 ppm
	1 hour	1.0 ppm	1.0 ppm	1.8 ppm	35 ppm
O_3	8 hours	0.046 ppm	0.049 ppm	0.047 ppm	0.075 ppm
$PM_{2.5}$	Annual	5.7 µg/m^3	5.9 µg/m^3	6.2 µg/m^3	15 µg/m^3
	24 hours	16.5 µg/m^3	16.6 µg/m^3	20.7 µg/m^3	35 µg/m^3
PM_{10}	24 hours	23 µg/m^3	28 µg/m^3	30 µg/m^3	150 µg/m^3

Notes: Monitoring location was at 4103 Beacon Avenue South, Seattle, WA.

Values shown correspond to NAAQS time periods.

CO = carbon monoxide

µg/m^3 = micrograms per cubic meter

NAAQS = National Ambient Air Quality Standards

O_3 = ozone

$PM_{2.5}$ = particulate matter with diameter less than or equal to 2.5 micrometers

PM_{10} = particulate matter with diameter less than or equal to 10 micrometers

ppm = parts per million

4.6.2 Long-Term Regional Operational Impacts

Long-term regional operational impacts have been evaluated for future scenarios in forecast year 2035 for all the alternatives. Regional traffic data were developed using PSRC's travel demand model for a representative project alternative that shows the expected effects of all the light rail alternatives. As discussed in Chapter 3, Transportation Impacts and Mitigation, the light rail alternatives have only minor differences in their mode split, travel patterns, and roadway speeds, and they all perform similarly when compared to the No Build Alternative.

Pollutant and GHG emission rates were developed using EPA's Motor Vehicle Emission Simulator (MOVES), model version 2010b. PSRC provided regionally specific MOVES input files, and national defaults were used when regionally specific inputs were not available.

Criteria Pollutant Emissions

Table 4.6-2 summarizes and compares predicted emission burdens for existing conditions (2011), the future 2035 No Build Alternative, and the Preferred Alternative in 2035. (The other potential combinations of light rail alternatives from Segments A through C would be similar to the Preferred Alternative.) Vehicle emissions in 2035 are predicted to be lower than existing levels due to EPA's national emission control programs and regulations. As shown in Table 4.6-2, all predicted criteria pollutants under the light rail alternatives would be below existing conditions and below the No Build Alternative pollutant levels in 2035.

Table 4.6-2. Daily Regional Emission Burden Assessment for Forecast Year 2035

Criteria Pollutant	Existing 2011 (kg/day)	No Build Alternative (kg/day)	Preferred Alternative (kg/day)	Percent Change from Existing (2011) to No Build Alternative	Percent Change from No Build Alternative to Preferred and Other Alternatives
VMT	79,442,960	100,592,498	100,307,852	26.26%	-0.28%
CO	501,626	274,061	273,279	-45.52%	-0.29%
$PM_{2.5}$	5,421	2,174	2,162	-60.11%	-0.55%
PM_{10}	7,233	4,722	4,688	-35.19%	-0.72%
VOCs	20,112	5,606	5,574		
NO_X	142,952	36,020	35,893	-74.89%	-0.45%

Source for 2011 conditions: PSRC Travel Demand Model; EPA MOVES model 2010b
kg/day = kilograms per day
VMT = vehicle miles traveled
CO = carbon monoxide
$PM_{2.5}$ = particulate matter with diameter less than or equal to 2.5 micrometers
PM_{10} = particulate matter with diameter less than or equal to 10 micrometers
VOCs = volatile organic compounds
NOx = nitrogen oxides

Mobile Source Air Toxic Emissions

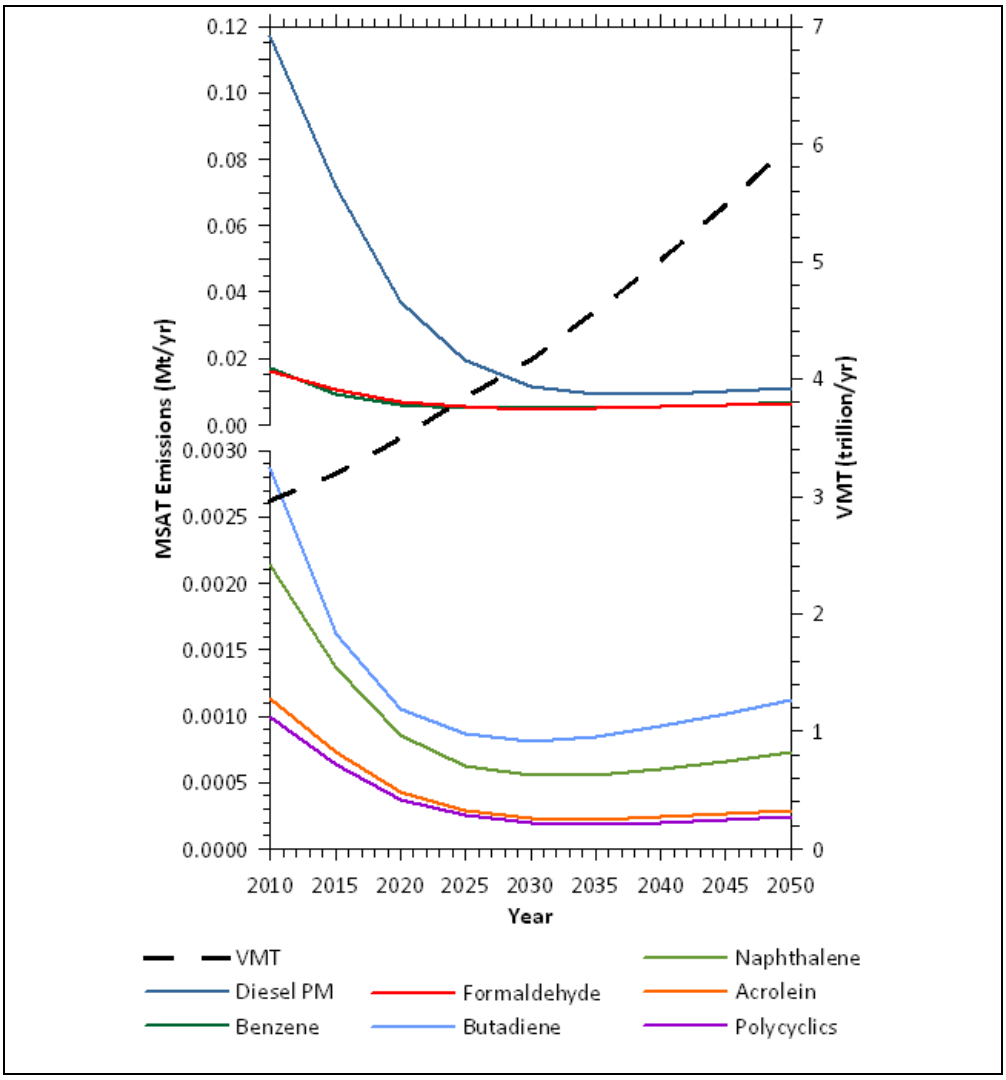
As compared to criteria pollutants, future MSAT emissions would experience greater reductions from present levels, with or without the Lynnwood Link Extension. As shown in Figure 4.6-1, EPA's national control programs are projected to reduce MSAT emissions by 83 percent from 2010 to 2050 even if the VMT increases by 102 percent (FHWA 2012). The reduced VMT predicted for the Preferred Alternative (Table 4.6-2) would enhance these MSAT emission reductions, although on a regional scale the percentage difference is small compared with the No Build Alternative in 2035.

Greenhouse Gases

GHG emission rates for the electricity required to operate the light rail were developed using emission factors from local electricity vendors (PSE 2013). Sound Transit's long-term target is to use only carbon neutral electricity. Currently, only electricity from one vendor (Seattle City Light) is carbon neutral. If only carbon-neutral electricity from all vendors is used, light rail GHG emissions would be much lower than those used in this analysis.

GHG emissions for commuter rail and buses were developed using EPA's Emission Factors for Greenhouse Gas Inventories (EPA 2011).

GHG emission rates for highway and road vehicles were developed using EPA's MOVES, model version 2010b. PSRC provided regionally specific MOVES input files, and national defaults were used when regionally specific inputs were not available. EPA's Emission Factors for Greenhouse Gas Inventories and MOVES do not take into account recent and likely future updates to EPA's fuel economy and emission standards. Other state and federal legislation also could reduce future emission rates. Therefore, future GHG emissions from commuter rail, buses, and highway and road vehicles could be lower than the model's estimates.



Source: Federal Highway Administration's Interim Guidance Update on Air Toxic Analysis in NEPA Documents (FHWA 2012); EPA MOVES 2010b model runs conducted during May–June 2012 by FHWA

Note: Trends for specific locations may be different, depending on locally derived information representing vehicle miles traveled, vehicle speeds, vehicle mix, fuels, emission control programs, meteorology, and other factors

Figure 4.6-1. Mobile Source Air Toxic Emissions Trends

GHG emissions are normally presented as the total CO_2 equivalent (CO_{2e}) released. The CO_{2e} emissions take into account the global warming potential of chemical emissions from a source. The analysis of the GHG emission impacts included evaluating the vehicle movements occurring in King, Pierce, Snohomish, and Kitsap counties. Chapter 3, Transportation Impacts and Mitigation, describes how the changes in vehicle movements were determined.

Table 4.6-3 summarizes the total projected GHG emissions for the No Build Alternative and the Preferred Alternative (representing all other light rail alternatives as well) for projected scenarios in 2035. CO_{2e} emissions are predicted to decrease by

76,285 metric tons annually in the region due to the reduction of VMT, a 0.5 percent reduction in CO_{2e}, as shown in Table 4.6-4.

Table 4.6-3. Daily Transportation Greenhouse Gas Emissions in Terms of CO_{2e} for Forecast Year 2035

Emission Source	Existing Vehicle Miles Traveled	Existing Daily CO_{2e} Emissions (metric tons)	No Build Alternative Vehicle Miles Traveled	No Build Alternative[a] Daily CO_{2e} Emissions (metric tons)	Preferred Alternative and Other Alternatives (vehicle miles traveled)	Preferred Alternative and Other Alternatives[a] Daily CO_{2e} Emissions (metric tons)
Non-transit Highway and Road Vehicles	79,442,960	40,730	100,592,498	45,192	100,307,852	44,988

Emission	No Build Alternative[a]	Preferred Alternative and Other Alternatives[a]
Daily CO_{2e}	45,910	45,701
Daily CO_{2e} Reduction	Not applicable	209
Annual CO_{2e} Reduction	Not applicable	76,285

[a] Unit of measure is metric tons CO_{2e} emissions

CO_{2e} = total carbon dioxide equivalent

Sound Transit published a *Sustainability Plan* in 2011 that builds on the 2007 Sustainability Initiative. According to the *Sustainability Plan*, Sound Transit will integrate efficient operating practices at existing and new facilities, use energy-saving equipment to reduce energy demand, and maximize intermodal transit connections to reduce automobile VMT. The implementation of the *Sustainability Plan* will reduce Sound Transit energy consumption, resulting in lower emissions burdens from light rail operation than currently predicted.

4.6.3 Long-Term Localized Operational Impacts

Long-term localized operational impacts on air quality and GHG emissions were evaluated using EPA's MOVES model to calculate vehicular emissions, and EPA's CAL3QHC dispersion model to calculate CO concentrations at sensitive receptors.

Sound Transit conducted CO modeling on the intersection in each project segment with the highest potential CO emissions. Intersections evaluated are presented in Appendix I-4.6. Traffic data were used to identify intersections with the highest traffic volume and a LOS of D or worse under the light rail alternatives for forecast year 2035. If one intersection had the highest volume under several of the alternatives, then that intersection was only evaluated under the alternative with the highest volume, representing the highest potential CO concentrations at that intersection. In addition to the forecast year conditions, each evaluated intersection was modeled for existing conditions, none of which showed CO concentrations above the NAAQS.

No Build Alternative

The modeled CO concentrations did not exceed the NAAQS for CO with the No Build Alternative in forecast year 2035; however, they increased slightly compared to 2011 due to increased traffic volumes. The results of the CO modeling are presented in Appendix I-4.6.

Long-Term Impacts Common to All Light Rail Alternatives

The modeled CO concentrations did not exceed the NAAQS in forecast year 2035. Therefore, none of the light rail alternatives would have intersections with CO concentrations above the NAAQS. Modeled Lynnwood Link Extension CO emissions were similar to the No Build Alternative because only slight variations in traffic would occur at the highest-volume intersections. The results of the CO modeling are presented in Appendix I-4.6.

4.6.4 Construction Impacts

Air Quality Pollutants

Construction-related air quality effects would result primarily from emissions from heavy-duty construction equipment (e.g., bulldozers, backhoes, and cranes), diesel-fueled mobile sources (e.g., trucks, brooms, and sweepers), diesel- and gasoline-fueled generators, and on-site and off-site project-related vehicles (e.g., service trucks and pickups).

Fugitive PM_{10} emissions are associated with land clearing, ground excavation, grading, cut-and-fill operations, and structure erection. PM_{10} emissions would vary from day to day, depending on the level of activity, specific operations, and weather conditions. Fugitive PM_{10} emissions from construction activities could be noticeable if uncontrolled. Mud and particulates from trucks may also be of concern if construction trucks are routed through streets near sensitive land uses (e.g., residences, schools, and parks).

Heavy trucks and construction equipment powered by gasoline and diesel engines would also generate $PM_{2.5}$, CO, and NO_x in exhaust emissions. If construction traffic and lane closures increase congestion and reduce the speed of other vehicles in the area, emissions would increase temporarily during delays. The effects would generally be limited to the immediate area in which the congestion occurs.

Some construction phases (particularly paving operations using asphalt) would result in short-term odors, which might be detectable to some people near the site. However, these odors would be diluted as distance from the site increases.

Greenhouse Gases

The generation of GHG emissions is directly related to the amount of fossil fuel burned. During construction, GHG emissions would be generated by diesel engines used to power most of the construction equipment. Sound Transit estimated GHG emissions during construction by using several sources, including information based on the agency's own projects that are similar in scale and construction methods to the Lynnwood Link Extension. Table 4.10-5 in Section 4.10, Energy Impacts, estimates overall energy use during construction as well, but it is based on a more general method of using general transportation or highway construction costs, and uses broader categories of factors to reach an energy estimate. Sound Transit's method calculates construction GHG emissions based on the agency's records of fuel costs and related construction activities on a per mile basis by alignment type (at-grade or elevated). It shows the estimated minimum and maximum construction-related GHG emissions for two representative alternatives from each project segment (Table 4.6-5).

Table 4.6-5. Estimated Construction Greenhouse Gas Emissions

Description	Segment A	Segment B	Segment C	Total
GHG emissions: Preferred Alternative (metric tons of CO_{2e})	32,489	18,884	13,050	64,423
GHG emissions: Other alternatives[a] (metric tons of CO_{2e})	30,264 to 32,489	18,492 to 20,365	10,349 to 13,050	59,105 to 65,904

[a] Segment A used Alternatives A5 (low) and A11 (high). Segment B used Alternatives B4 (low) and B2 (high). Segment C used Alternatives C3, Option 1 (low) and C3, Option 2 (high).

CO_{2e} = total carbon dioxide equivalent

The low estimate for the alternatives with the least construction-related GHG emissions is the sum of Alternatives A5, B4, and C3 Option 1. The high estimate for the alternatives with the highest construction-related GHG emissions is the sum of the Preferred Alternative in Segment A, Alternative B2A, and the Preferred Alternative in Segment C.

Conformity Determination

In the Puget Sound region, PSRC determines regional conformity by including a project in the Metropolitan Transportation Plan (MTP) and the RTIP. The Lynnwood Link Extension is identified and described in the region's MTP, *VISION 2040*, *Transportation 2040*, and in the 2013-2016 RTIP (PSRC 2012). It is designated in PSRC's RTIP as project RTA-78.

In addition to the long-term localized operational impacts (2035), Sound Transit predicted localized worst-case CO concentrations from the Lynnwood Link Extension for initial operations (2023) and the long-range RTP analysis year (2040) to demonstrate project-level CO conformity. The results of the CO modeling are presented in Appendix I-4.6. None of the Lynnwood Link Extension alternatives, including the Preferred Alternative, would have intersections with CO concentrations above the NAAQS. The project corridor is in an attainment area for all the other criteria pollutants (including PM_{10} and $PM_{2.5}$); therefore, further analysis of the other criteria pollutants is not required. Based on the results of the localized CO analysis presented in Appendix I-4.6, the Lynnwood Link Extension, including the Preferred Alternative, would not cause the NAAQS for CO to be exceeded or exacerbated. It would meet the project-level conformity requirements of the CAA.

4.6.5 Indirect Impacts

The traffic analyses for the Lynnwood Link Extension considered the long-term traffic forecasted to operate within the study area. Minor indirect air quality benefits would occur because the project would help to reduce future traffic volumes and levels of congestion within the study area compared with the No Build Alternative, as well as reduce traffic-related air pollutant and GHG emissions. Negative indirect air quality effects would be unlikely.

Producing and disposing of materials needed to build the project will release GHGs, which would be an indirect effect of the project. However, at this time, there is no accurate and standardized methodology for calculating the embodied and lifecycle emissions from transportation projects.

4.6.6 Cumulative Impacts

Cumulative air quality effects include those from the project when combined with those of other past, present, and reasonably foreseeable projects. The project's air quality analysis of 2035 conditions includes the transportation-related emissions related to the region's reasonably foreseeable population and employment growth. Therefore, the preceding findings about 2035 conditions reflect the cumulative effects.

On a very small scale, other projects could affect transportation and, therefore, air quality at specific intersections. For example, Sound Transit's OMSF, if sited in

Lynnwood, would alter traffic in Lynnwood, although that project's Draft EIS found no NAAQS exceedances (Sound Transit 2014).

Also, Sound Transit is developing the Northgate Link Extension. While this project is scheduled to be completed and in operation prior to completion of the Lynnwood Link Extension, some overlapping periods of construction could occur at Northgate. To address this, the construction phasing and the construction mitigation plans between the two projects will be coordinated to minimize any combined impacts, minimizing typical construction period air quality impacts such as dust or diesel emissions, or emissions from increased traffic congestion. King County's high-density transit-oriented development at Northgate could create additional construction-related impacts in the area. Construction of this development will need to be coordinated with construction activities related to the light rail projects in order to minimize overall impacts.

Localized construction pollutants and GHG emissions would be higher with concurrent projects, but would probably not exceed air quality standards because Sound Transit would employ mitigation measures and BMPs to minimize any impacts.

4.6.7 Potential Mitigation Measures

Operational Mitigation

Because no adverse air quality impacts are expected, no specific mitigation is proposed.

Construction Mitigation

Consistent with PSCAA requirements, Sound Transit would use BMPs to prevent and reduce air quality impacts resulting from construction activities. Construction activities must comply with local regulations governing air quality, including those for controlling fugitive dust during construction. The following mitigation measures would be used, as necessary, and in accordance with standard practice to control PM_{10}, $PM_{2.5}$, and emissions of CO and NO_x during construction. Several of these measures would also reduce GHG emissions:

- Spray exposed soil with a dust control agent, such as water.
- Cover all transported loads of soils and wet materials before transport, or provide adequate freeboard (i.e., space from the top of the material to the top of the truck).
- Install wheel washes or manually wash truck wheels, where needed.
- Remove the dust and mud that are deposited on paved, public roads.
- Route and schedule high volumes of construction traffic, where practicable.

- Require appropriate emission-control devices on all construction equipment powered by gasoline or diesel fuel.
- Use well-maintained heavy equipment.
- Cover, install mulch, or plant vegetation as soon as practicable after grading.
- Encourage contractors to employ emission-reduction technologies and practices for both on-road and off-road equipment and vehicles (e.g., retrofit equipment with diesel control technology and/or use ultra-low sulfur diesel).
- Implement idling restrictions for construction trucks.
- Locate construction equipment and truck staging zones away from sensitive receptors, as practicable, and in consideration of other factors such as noise and safety.

4.7 Noise and Vibration

This section describes the project's noise and vibration effects during construction and operation, including mitigation measures Sound Transit would implement to address impacts from the project. For more information and reference sources, see the *Noise and Vibration Technical Report*.

4.7.1 Background and Criteria

Noise and vibration are caused by waves of energy being transmitted through a material such as air or the ground. Noise, which is unwanted sound, includes vibrations that can be detected by the ear. Groundborne vibration differs from airborne noise in that it consists of energy transmitted through the earth rather than the air.

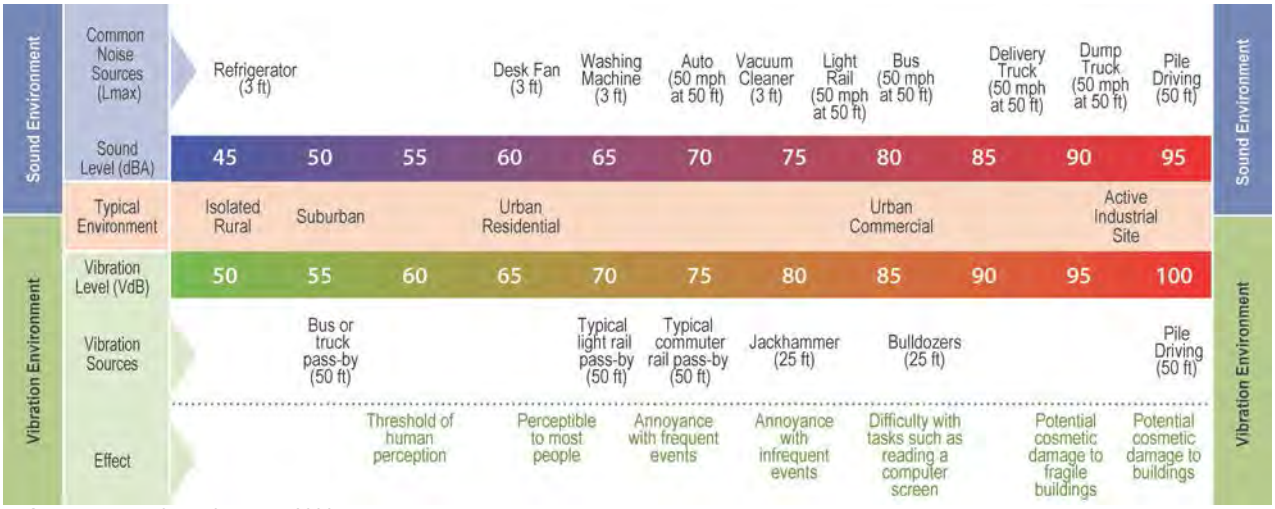
Sound Transit evaluates noise and vibration impacts for transit projects according to the FTA *Transit Noise and Vibration Impact Assessment* guidance manual (FTA 2006). FTA's standards for noise and vibration impacts are based on several decades of studying community reaction to environmental noise and vibration exposure (FTA 2006). The FTA manual categorizes land uses based on their sensitivity to noise or vibration.

Noise

Environmental noise is composed of many frequencies, each occurring simultaneously at its own sound pressure level. The range of magnitude, from the faintest to the loudest sound the ear can hear, is so large that sound pressure is expressed on a logarithmic scale in units called decibels (dB). The commonly used frequency weighting of environmental noise is A-weighting (dBA), which is a measure of how an average person hears changes in sound levels; people can typically detect a 2 dBA change in sound levels. The human ear perceives a 10 dBA

change in sound level as a doubling of loudness. However, adding two sounds of the same loudness together does not double the decibel value.

A common noise descriptor for environmental noise is the equivalent sound level (Leq). Leq is a measure of total noise, a summation of all sounds, during a period of time and averaged over that period of time. Leq measured over a 1-hour period is the hourly Leq [Leq(h)]. The day/night noise level (Ldn) describes the cumulative 24-hour exposure to sound, with a penalty applied to noise exposure between 10 pm and 7 am. Lmax is the maximum noise level during an event. Ldn is used by the EPA and FTA to evaluate noise levels in residential areas. Typical sound and vibration levels experienced in urban environments are shown in Figure 4.7-1.



Sources: EPA 1971, 1974; FTA 2006

Figure 4.7-1
Typical Sound and Vibration Levels

Noise from light rail operations is generated by the interaction of wheels and rails, warning devices, motive power, rail substructure vibration, associated park-and-rides, and the operation of traction power substations. The interaction between steel wheels and rails generates four different types of light rail noise depending on track work: (1) noise generated by passing trains on the track, (2) wheel squeal on a tightly curved track (common for a curve radius of less than 600 feet and possible for a curve radius between 600 and 1,000 feet), (3) noise generated from wheel flanging caused by the centrifugal force from an unbalanced car body, and (4) noise generated on special trackway sections, such as at crossovers or turnouts. Warning bells are another source of light rail noise; bells are sounded when trains enter or leave the stations. Noise levels near a project may also be affected by changes to traffic patterns, roadway alignments, noise walls, and other shielding.

The level at which project noise (called project noise exposure) creates an impact varies, depending on the existing (pre-project) noise environment and on the type of land use that is affected. Future noise exposure is the combination of existing noise exposure and the additional noise exposure caused by a project. Many land uses are not noise-sensitive. FTA guidance categorizes noise-sensitive land uses as shown in Table 4.7-1.

Table 4.7-1. FTA Land Use Categories for Noise Impact Analysis

Category	Metric	Land Use Description
1	Leq(h)[a] (dBA)	Tracts of land where quiet is an essential element in their intended purpose. This category includes lands set aside for serenity and quiet, land uses such as outdoor amphitheaters and concert pavilions, and National Historic Landmarks with substantial outdoor use.
2	Ldn (dBA)	Residences and buildings where people normally sleep. This category includes homes, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.
3	Leq(h)[a] (dBA)	Institutional land uses with primary daytime and evening use. This category includes schools, libraries, and churches where it is important to consider interference with such activities as speech, meditation, and concentration on reading material. Buildings with interior spaces where a quiet environment is important, such as medical offices, conference rooms, recording studios, and concert halls, fall into this category. It also includes places for meditation or study associated with cemeteries, monuments, and museums. Certain historical sites, parks, and recreational facilities are also included. However, parks are not noise-sensitive if they feature active recreation or sporting facilities.

[a] Leq for the noisiest hour of transit-related activity during hours of noise sensitivity.

Source: FTA 2006

The FTA noise impact criteria recognize that in a loud environment, even a small increase in noise can increase annoyance. The criteria are shown by category on Figure 4.7-2. Impact criteria for highly-sensitive uses (Category 1, measured in Leq[h]) and residential uses (Category 2, measured in Ldn) are shown on the left side of the graph. Impact criteria for noise-sensitive institutional uses (Category 3, measured in Leq[h]) are shown on the right. The graph shows, for example, that if the existing noise level in a residential area is 60 dBA Ldn, then a project that generates less than 58 dBA Ldn will not have an effect. If the project generates between 58 and 63 dBA Ldn, it will cause a moderate impact, and if it generates more than 63 dBA Ldn, it will cause a severe impact. Above the severe impact criteria, most people would be highly annoyed by the noise.

FTA requires that mitigation be considered for both moderate and severe impacts. Sound Transit's practice is to mitigate both moderate and severe impacts to meet applicable FTA, state, and local noise criteria using a prioritized approach to measures beginning with source treatment, to treatments in the noise path, and then sound insulation as the last option (Motion No. M2004-08, Sound Transit 2004).

Figure 4.7-2
FTA Transit Project Noise Exposure Impact Criteria

FTA's guidance is to follow FHWA noise assessment procedures and abatement criteria when a project is a joint FTA and FHWA project, the transit operations are adjacent to or on the highway, and highway noise dominates the transit noise over the 24-hour day. The Lynnwood Link Extension Project is not a joint project; therefore, FTA criteria are applicable. Where a project could change traffic noise levels experienced at sensitive receivers because it would include activities such as relocating existing highway noise walls, making changes to ramps, or removing existing noise-blocking structures, FTA's guidance is to consider both potential transit noise impacts using the FTA criteria and traffic noise impacts using FHWA's criteria included in 23 CFR 772.

FTA has general guidance on construction noise assessment that considers the nature and duration of the construction as well as local community factors. State or local noise regulations apply to construction noise and operational noise from stationary sources, such as park-and-rides and traction power substations. Seattle and Lynnwood have adopted noise control ordinances based on the Washington State Noise Control Rule (Washington Administrative Code [WAC] 173-60). The rule includes property-line noise limits (Table 4.7-2), but does not apply to warning devices or to motor vehicles that are regulated under WAC 173-60 as individual noise sources. Shoreline and Mountlake Terrace regulate noise as a public

disturbance. Sound Transit will apply the Washington State noise limits as noise impact criteria for stationary sources within those jurisdictions. The *Noise and Vibration Technical Report* discusses the requirements of the individual local ordinances when they differ from the WAC regulations.

Table 4.7-2. Washington State Noise Limits

	Maximum Allowable Sound Level (dBA)[a] at Property Line		
Property Usage	**Residential**	**Commercial**	**Industrial**
Residential	55	57	60
Commercial	57	60	65
Industrial	60	65	70

[a] Between 10 pm and 7 am, the levels given above are reduced by 10 dBA for residential receiving property.

Source: WAC Chapter 173-60-040; excludes transportation sources on public right-of-way.

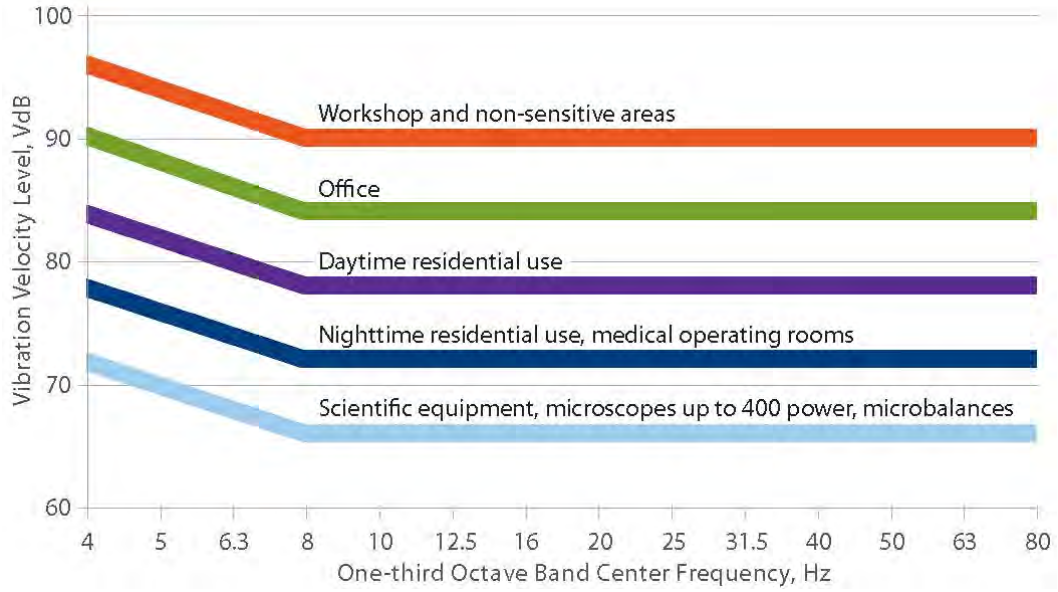
Note: Local noise ordinances can include different noise limits than state law.

Vibration

Vibration is an oscillatory (back-and-forth) motion that is often characterized by the velocity of the back-and-forth motions (measured in inches per second) and their frequency. Root-mean-square characterizes the average vibration velocity over time and may be reported on a logarithmic scale as vibration decibels (VdB), which is a good indicator of how people perceive vibration. Groundborne vibration generally occurs within a frequency range between approximately 1 and 200 hertz (Hz). The FTA groundborne vibration impact criteria are based on land use and train passage frequency. Typical vibration levels experienced in urban environments are shown in Figure 4.7-1.

Vibration is generated by motion at the wheel and rail interface, and is affected by rail condition or roughness, track geometry, vehicle suspension, train speed, rail substructure type and geometry, special trackwork, and soil conditions. Vibration from a passing train can move through the ground and transfer this motion to a building's foundation. This type of vibration does not damage buildings but can be annoying to building occupants. Detailed vibration analysis criteria consider the frequency (Hz) and velocity (VdB) of the back-and-forth motions of vibration. Figure 4.7-3 shows the detailed vibration impact criteria for land uses found within the project corridor (FTA 2006).

Short-term impacts caused by construction vibration are evaluated for their potential to cause cosmetic damage to nearby structures; however, the vibration levels are temporary and do not require an analysis based on the uses inside the structures. Also, most construction processes involve vibration well below the levels that could cause building damage, even if vibrations are felt.



Source: FTA 2006

Figure 4.7-3
FTA Detailed Vibration Analysis Impact Criteria

4.7.2 Affected Environment

To provide a baseline for comparing future project-generated noise and vibration levels, Sound Transit measured noise levels at 59 locations, and took vibration propagation measurements at 14 locations, as shown in Figures 4.7-4a and 4.7-4b.

Traffic on I-5 is the dominant noise source and traffic on local streets is the dominant vibration source in the project corridor. Existing noise walls reduce the freeway noise reaching neighboring residential areas through several areas of the corridor, particularly in Segment A in Seattle and Shoreline. While land use in the corridor is largely suburban, sound levels were typical of urban residential environments because of the proximity to I-5.

The majority of the project corridor includes single- and multifamily residential uses. Non-residential noise-sensitive uses in the corridor include schools and churches. Parks are noise sensitive when the primary use of the park is noise sensitive, but not when the primary use is active recreation. Uses in Scriber Creek Park have been classified as noise sensitive. There are no FTA Category 1 uses in the study area.

Two vibration-sensitive commercial uses, including one business that does laser etching and one for phonograph restoration, are at 20815 52nd Avenue West in Lynnwood.

4.7.3 Long-Term Impacts

The noise impact analysis considers noise from passenger service train operation, wheel squeal from curves, warning bells, and the effects of crossover switches. The alternatives do not include any at-grade crossings; therefore, warning devices would only be used for trains entering and leaving stations. In addition to assessing transit noise, the impact analysis includes areas where the project could change traffic noise levels experienced at sensitive receivers as a result of relocating existing highway noise walls, changing ramps, or removing existing structures to accommodate the construction and operation of light rail (primarily in Segment A). Relocated traffic noise walls are included in the project design as shown in Appendix F, Conceptual Plans.

The vibration analysis takes into account the location and structures for the guideway (at-grade or elevated), distance to sensitive receivers, soil conditions, and trackwork, such as switches.

Noise and vibration impacts identified in this EIS are those that would occur absent any mitigation; however, as detailed in Section 4.7.7, Sound Transit would provide mitigation for all vibration and moderate or severe noise impacts caused by the project. Residual impacts would occur where typical mitigation approaches could not reduce project noise exposure levels to below the moderate impact criteria. These locations may be eligible for sound insulation to further reduce interior noise levels. Figures 4.7-5a through 4.7-5d show the potential noise and vibration impacts along the project corridor for each light rail alternative.

For the Final EIS, the number of noise and vibration impacts associated with the light rail alternatives has increased since the Draft EIS because Sound Transit adjusted the assumed operating plan to reflect the potential need for four-car trains running during all operating hours (the Draft EIS assumed that two-car trains would be run after 6:30 pm).

No Build Alternative

Noise in the corridor would continue to be dominated by I-5 and would not be affected by the construction of a new transit project.

Segment A: Seattle to Shoreline

As shown in Table 4.7-3, moderate to severe noise impacts would occur at between 306 and 309 locations along the Preferred Alternative, while the other Segment A alternatives would affect 234 to 493 properties. Elevated sections would have the most noise impacts; however, the elevated sections would create fewer vibration impacts.

Potential Noise and Vibration Impacts

Lynnwood Link Extension

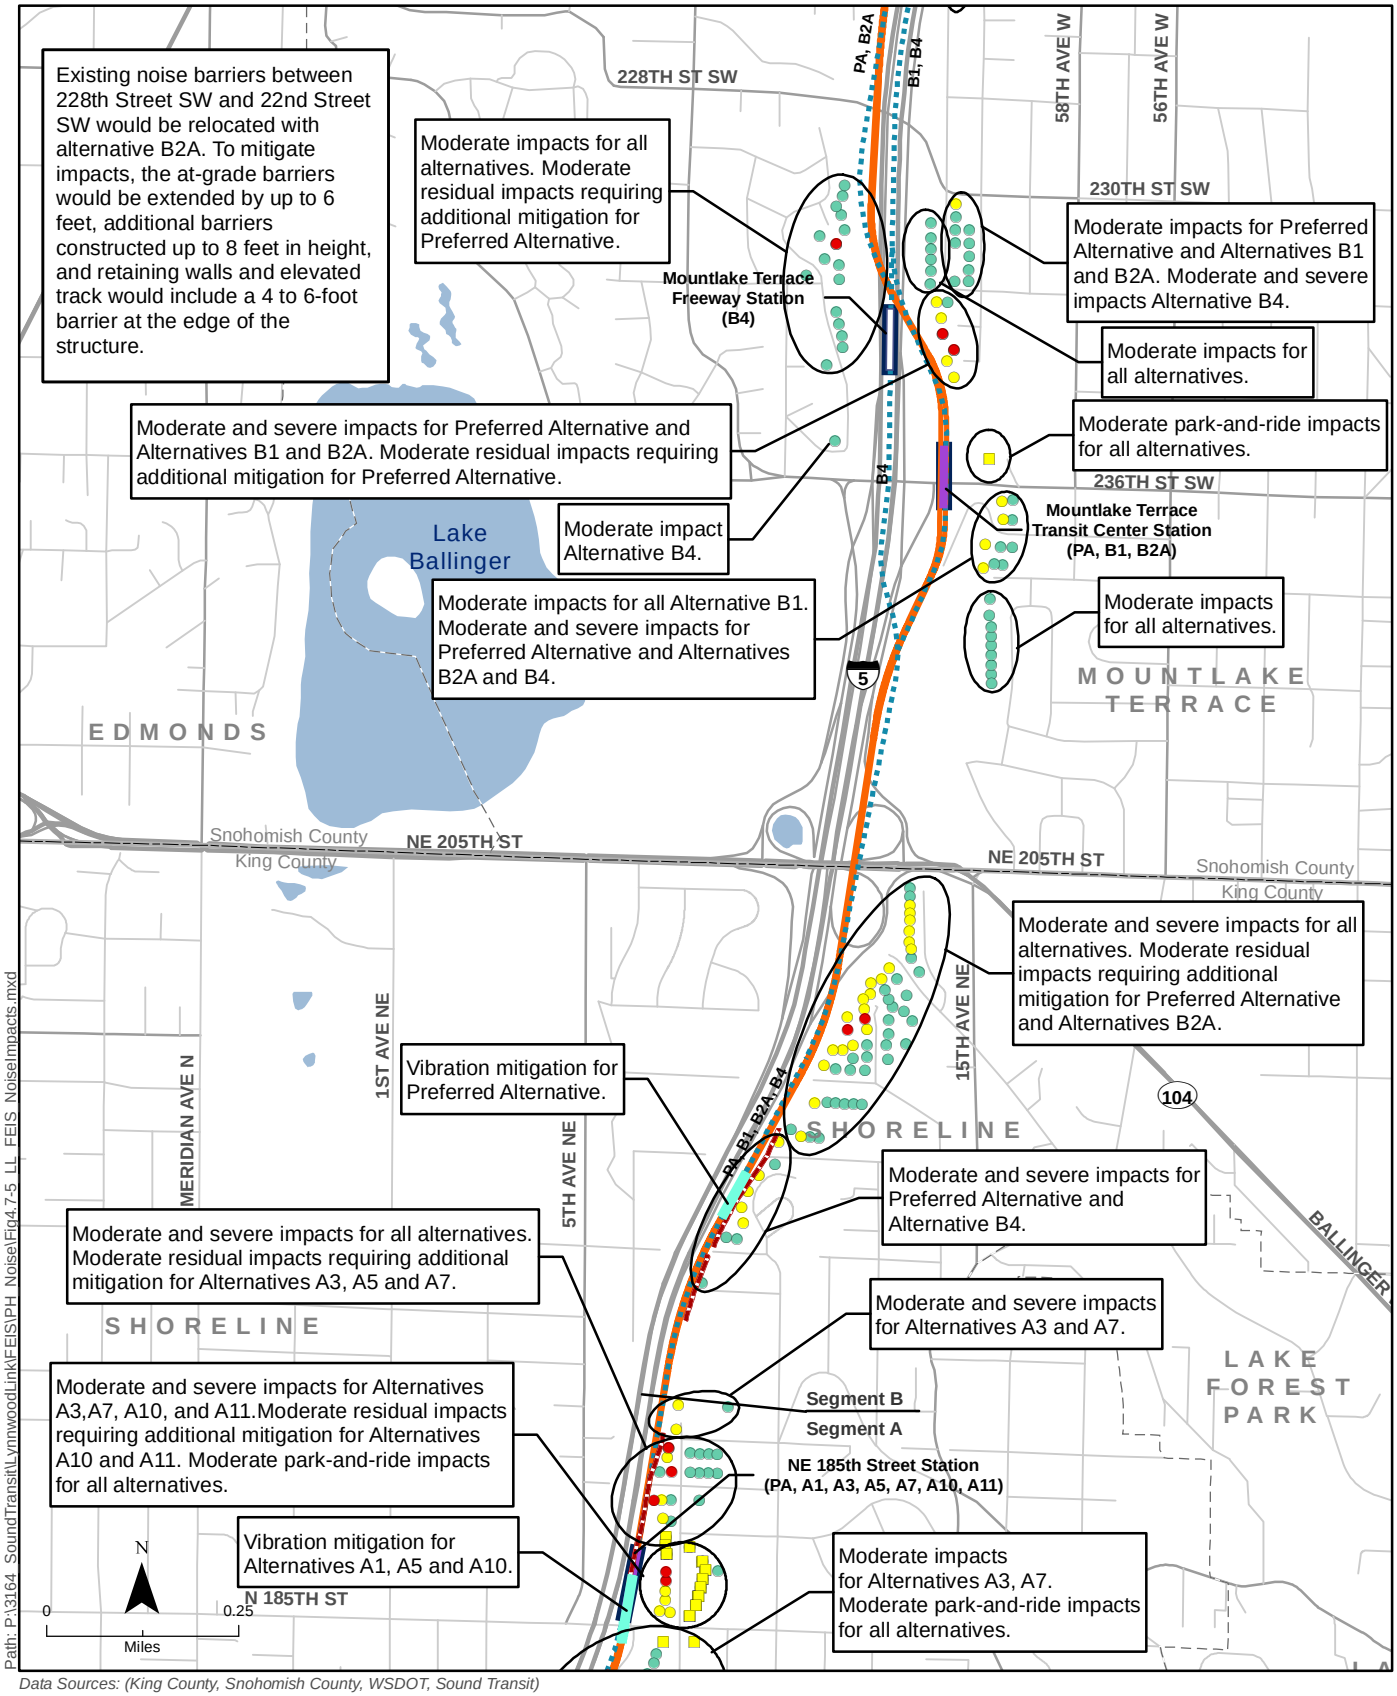

Figure 4.7-5c
Potential Noise and Vibration Impacts

Lynnwood Link Extension

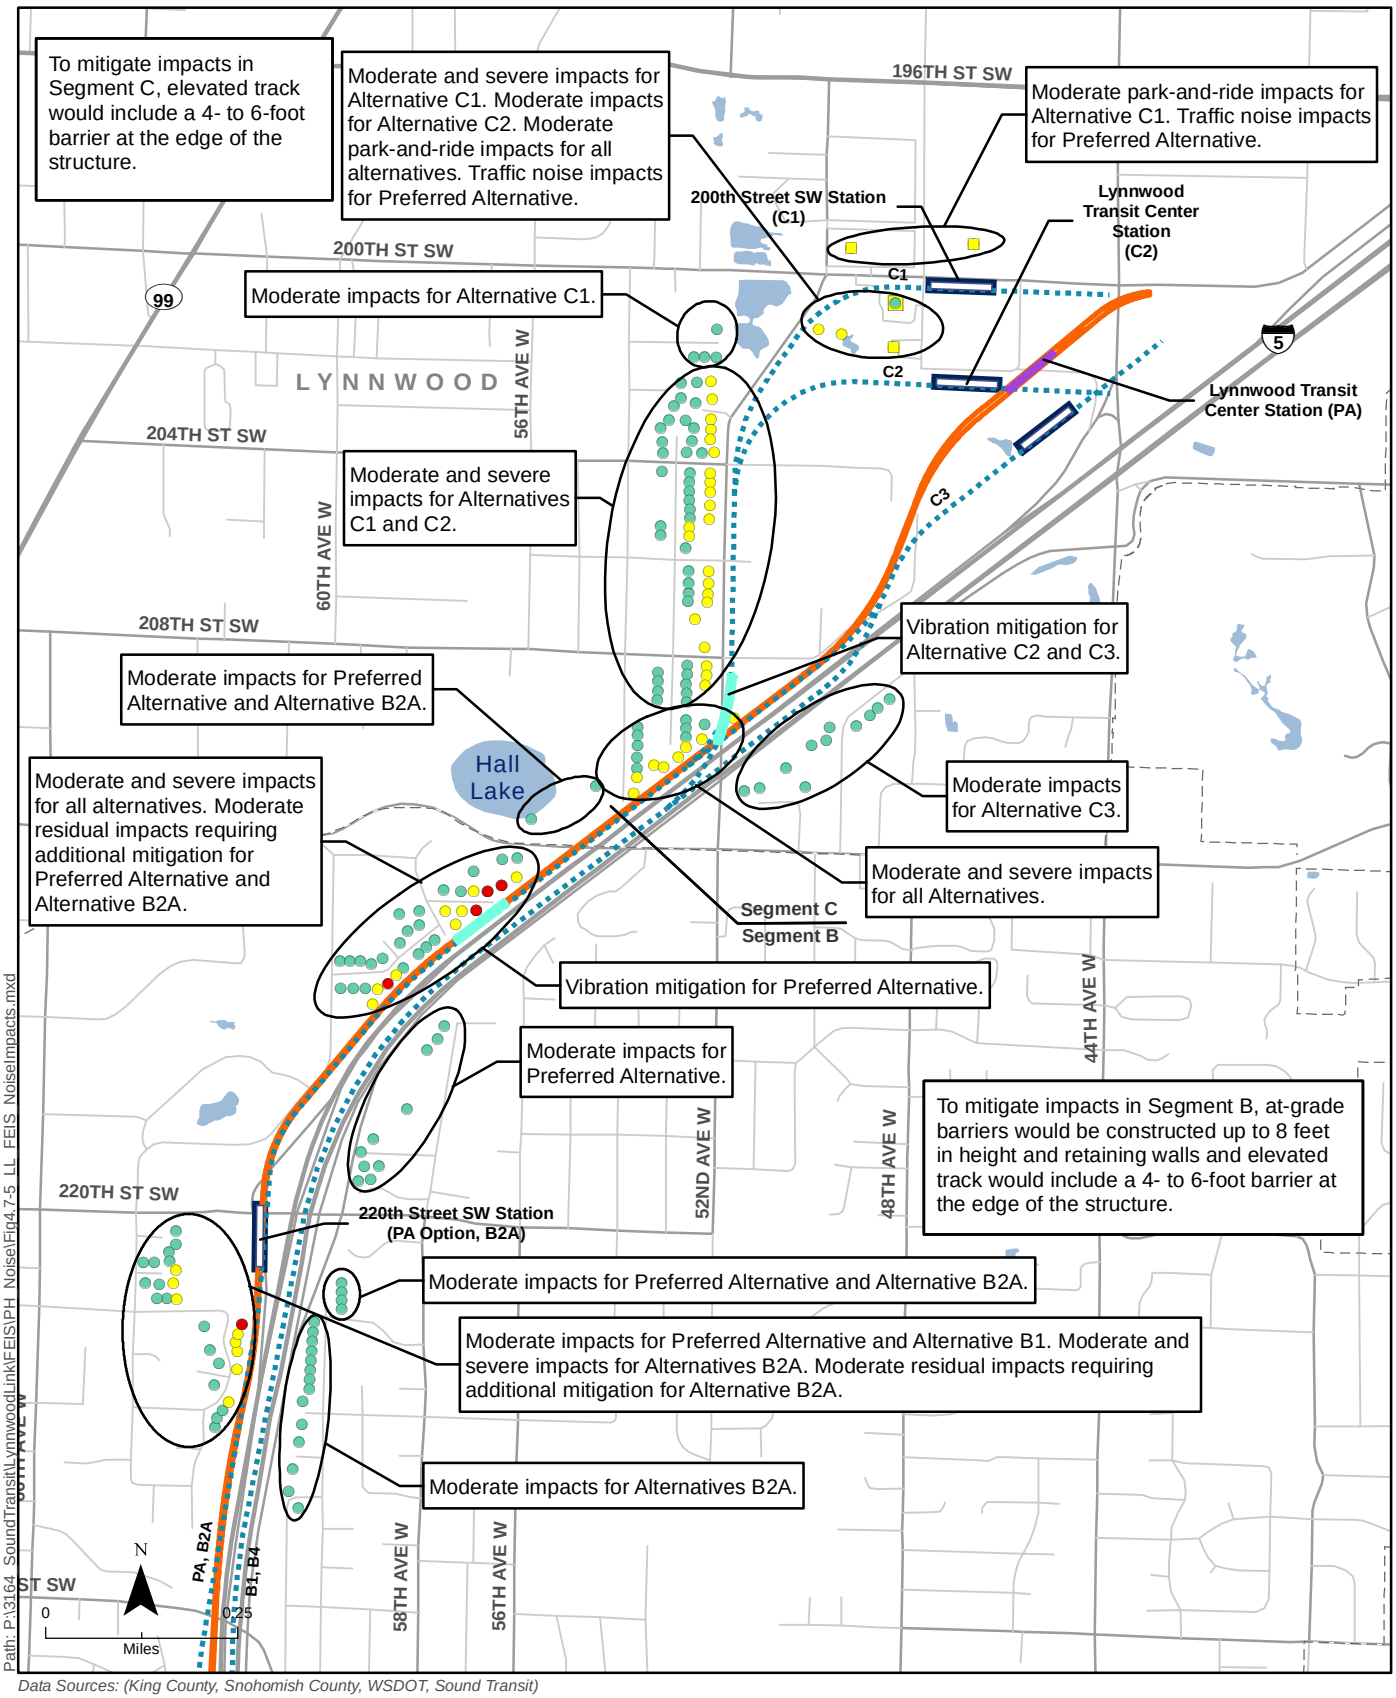

Figure 4.7-5d
Potential Noise and Vibration Impacts

Lynnwood Link Extension

Table 4.7-3 shows noise impacts for all alternatives from buses within the park-and-rides and off-street transfer points at the NE 185th Street Station. Noise levels at this location would not exceed the FTA impact criteria but would exceed local noise limits.

For all alternatives, the project would remove, relocate, and replace existing noise walls along I-5. The replacement noise-reduction treatments would be designed to provide at least as much noise reduction of highway noise as the walls being removed; where feasible, the walls also would reduce noise from light rail whether or not the light rail noise would otherwise create an impact.

Table 4.7-3. Number of Properties with Projected Transit Noise and Vibration Impacts in Segment A (Before/After Mitigation) [a,b]

Alternative	Moderate Noise Impacts	Severe Noise Impacts	Station and Park-and-Ride Access Impacts	Total Noise Impacts	Vibration Impacts
Preferred Alternative	181/0	112/0	13/0	306/0	27/0
Preferred Alternative With Shoreline Stadium Parking Garage Option	181/0	112/0	16/0	309/0	27/0
A1	190/0	29/0	15/0	234/0	9/0
A3	269/0	198/0	9/0	476/0	8/0
A5	181/0	105/0	17/0	303/0	16/0
A7	296/0	183/0	14/0	493/0	9/0
A10	161/0	110/0	12/0	283/0	14/0
A11	272/0	195/0	9/0	476/0	8/0

[a] Properties that are planned to be acquired are not included in the noise impact analysis.

[b] Noise levels that are not reduced to below the applicable criteria through source and path treatments (such as noise walls on the ground or noise barriers on the light rail guideway) may be eligible for sound insulation.

With the Preferred Alternative and other mostly at-grade alternatives, Sound Transit would need to relocate four to six sections of the existing noise walls on the east side of I-5 in Segment A. The elevated alternatives would relocate and rebuild sections as well. The Preferred Alternative would replace approximately 11,900 linear feet of noise wall (see Appendix F, Conceptual Plans) while the other alternatives would replace between 2,100 and 8,200 feet of noise wall. Most of the replacement walls would be east of their current locations and reduce both rail noise and traffic noise reaching the residents. For light rail sections that are elevated, some existing noise walls along I-5 could be maintained in place where they do not conflict with the construction of the elevated guideway, but there are areas where noise walls still would need to be replaced. Ground-level freeway noise walls would not reduce transit noise from an elevated structure; therefore, the elevated structures would have noise barriers incorporated into the guideway when transit noise levels exceed criteria at nearby properties.

Rail track curves within Segment A have more than a 1,000-foot radius; therefore, no wheel squeal is anticipated in Segment A. All of the Segment A alternatives have crossover switches, which are an additional source of wheel-track noise.

Vibration levels before mitigation would affect between 8 and 27 properties, with more properties affected by the Preferred Alternative and other mostly at-grade alternatives (Table 4.7-3).

Preferred Alternative: At-grade/Elevated with NW 145th and NE 185th Stations

The Preferred Alternative would cause noise impacts at single- and multifamily residences and two churches (the Seattle Latvian Evangelical Lutheran Church and the True Jesus Church/Resurrection Fellowship Church of God). Most of the impacts would occur between Northgate Way and NE 127th Street and in sections where the guideway is elevated, such as near NE 145th Street and NE 155th Street. Bus noise would impact residences near the NE 185th Street Station with either of the parking garages located west of I-5; however, there would be three additional impacts with the Shoreline Stadium parking garage option. Relocated noise walls would mitigate any traffic noise impacts associated with project changes requiring movement of the existing noise walls.

Alternative A1: At-grade/Elevated with NE 145th and NE 185th Stations

Alternative A1 would cause transit noise impacts at single- and multifamily residences, mostly located between NE Northgate Way and NE 117th Street and in sections where the guideway is elevated, such as near NE 145th Street, NE 155th Street, and NE 175th Street. These impacts include residences near the NE 185th Street Station that would be affected by noise from buses accessing the station.

Alternative A3: Mostly Elevated with NE 145th and NE 185th Stations

Alternative A3 would cause transit noise impacts at single- and multifamily residences, and two churches—the Seattle Latvian Evangelical Lutheran Church and the North Seattle Church of the Nazarene. Impacted receivers also include residences near the NE 185th Street Station park-and-ride. The longer stretches of elevated guideway are the primary reason that Alternative A3 would have more impacts than the mostly at-grade Preferred Alternative, which already would benefit from existing noise walls along at-grade sections.

Alternative A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations

Alternative A5 would cause transit noise impacts at single- and multifamily residences and one church—the True Jesus Church/Resurrection Fellowship Church

of God. Park-and-ride noise would affect residences near the NE 155th Street and the NE 185th Street Stations. Alternative A5 would cause more severe impacts than the Preferred Alternative in the area between NE Northgate Way and NE 117th Street because the alignment would be closer to residences. Compared with the Preferred Alternative, impacts would be greater at NE 145th Street because train speeds would be higher and fewer properties would be displaced without the NE 145th Street Station. Fewer impacts, however, would occur between NE 149th Street and NE 156th Street because train speeds would be lower near the NE 155th Street Station.

Alternative A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations

Alternative A7 transit noise impacts would be similar to Alternative A3, including park-and-ride noise impacts to residences near the NE 155th Street and NE 185th Street Stations. Compared to Alternative A3, fewer light rail noise impacts would occur in the vicinity of NE 155th Street, but more impacts would be experienced between NE 145th Street and NE 151st Street because of differences in speed, alignment, and the number of residential properties near the different station sites.

Alternative A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations

Alternative A10 transit noise impacts would be similar to Alternative A5, with slightly fewer impacts between NE 145th Street and NE 151st Street.

Alternative A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations

Transit noise impacts with Alternative A11 would be similar to Alternative A3, including park-and-ride noise impacts near the NE 185th Street Station.

Segment B: Shoreline to Mountlake Terrace

The Preferred Alternative in Segment B would cause between 202 and 217 moderate or severe noise impacts, depending on the station option, while other alternatives would cause 110 to 192 noise impacts (Table 4.7-4 and previous Figures 4.7-5c through 4.7-5d). These impacts include noise from rail operations and from bus service to the Mountlake Terrace Station.

Each Segment B alternative includes a park-and-ride at Mountlake Terrace Station, where noise limits are governed by state code, as previously shown in Table 4.7-2. Although noise from the park-and-ride would not exceed the FTA impact criteria, noise levels at four residences adjacent to the park-and-ride would exceed noise limits under state code as a result of modified bus service to the station. Only Alternative B2A would relocate existing noise walls in Segment B.

Table 4.7-4. Number of Properties with Transit Noise and Vibration Impacts in Segment B (Before/After Mitigation)[a,b]

Alternative	Moderate Noise Impacts	Severe Noise Impacts	Station and Park-and-Ride Access Impacts	Total Noise Impacts	Vibration Impacts
Preferred Alternative	148/0	65/0	4/0	217/0	3/0
Preferred Alternative with 220th Street Station South Option	133/0	65/0	4/0	202	3/0
B1	89/0	29/0	4/0	122/0	0
B2A	138/0	50/0	4/0	192/0	0
B4	73/0	33/0	4/0	110/0	0

[a] Properties that are planned to be acquired are not included in the noise impact analysis.

[b] Noise levels that are not reduced to below the applicable criteria through source and path treatments (such as noise walls on the ground or noise barriers on the light rail guideway) may be eligible for sound insulation.

Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side

The Preferred Alternative would affect single- and multifamily residences along the guideway and the Mountlake Terrace Preschool. Moderate park-and-ride noise impacts would occur near the Mountlake Terrace Station. An 800-foot radius curve south of the Mountlake Terrace Transit Center could generate wheel squeal. The options for a station south of 220th Street SW would result in fewer noise impacts than the Preferred Alternative with no 220th Street SW Station because of changes in vehicle speed and alignment in the vicinity of the station, and because the guideway to the station would shift west and displace five residences that would otherwise experience noise impacts with the Preferred Alternative.

Alternative B1: East Side to Mountlake Terrace Transit Center to Median

Transit noise levels would cause impacts to single- and multifamily residences, including park-and-ride noise impacts near the Mountlake Terrace Station. Alternative B1 would have fewer noise impacts than the Preferred Alternative because the alignment would follow the I-5 median for the majority of Segment B, relatively distant from noise-sensitive uses. An 800-foot radius curve south of the Mountlake Terrace Transit Center could generate wheel squeal.

Alternative B2A: East Side to Mountlake Terrace Transit Center to West Side

Lower train speeds near the 220th Street SW Station would reduce noise impacts compared with the Preferred Alternative. Sound Transit would replace approximately 900 linear feet of existing highway noise wall along I-5.

Alternative B4: East Side to Mountlake Terrace Freeway Station to Median

Noise impacts would occur along the alignment and near the Mountlake Terrace Station. An 800-foot radius curve at 236th Street SW could generate wheel squeal.

Segment C: Mountlake Terrace to Lynnwood

The Preferred Alternative would have noise impacts at 115 properties, while other alternatives in Segment C would cause between 29 and 234 such impacts (Table 4.7-5 and previous Figure 4.7-5d).

All of the alternatives would reconfigure the existing park-and-ride at 200th Street SW and would modify the transit center operations. While noise from the park-and-ride would not exceed the FTA impact criteria, noise levels at up to 58 multifamily residential units adjacent to the park-and-ride would exceed City of Lynnwood noise limits before mitigation is applied. The Preferred Alternative would include roadway changes to improve access to the Lynnwood Transit Center that would cause traffic noise impacts to 23 residential units.

Because the alternatives would be elevated, there is limited potential for vibration impacts; however, Alternatives C1 and C2 could cause one or two vibration impacts, depending on the option, because the elevated guideway columns would be close to vibration-sensitive properties.

Table 4.7-5. Number of Properties with Transit Noise and Vibration Impacts in Segment C (Before/After Mitigation)[a,b]

Alternative	Moderate Noise Impacts	Severe Noise Impacts	Station and Park-and-Ride Access Impacts	Total Noise Impacts	Vibration Impacts
Preferred Alternative	26/0	8/0	81[c]/0	115/0	0
C1 (Option 1: Median)	159/0	24/0	51/0	234/0	2/0
C1 (Option 2: West of I-5)	152/0	23/0	51/0	226/0	1/0
C2 (Option 1: Median)	52/0	41/0	58/0	151/0	2/0
C2 (Option 2: West of I-5)	49/0	41/0	58/0	148/0	1/0
C3 (Option 1: Median)	16/0	1/0	12 - 58/0	29 - 75/0	0
C3 (Option 2: West of I-5)	13/0	8/0	12 - 58/0	33 - 79/0	0

[a] Properties that are planned to be acquired are not included in the noise impact analysis.

[b] Noise levels that are not reduced to below the applicable criteria through source and path treatments (such as noise walls on the ground or noise barriers on the light rail guideway) may be eligible for sound insulation.

[c] Twenty three multi-family residential units would be affected by traffic noise resulting from roadway changes to 200th Street SW related to access to the Lynnwood Transit Center.

Preferred Alternative: West Side to Lynnwood Park-and-Ride Station

The Preferred Alternative would have moderate or severe transit noise impacts to 34 noise-sensitive properties west of 52nd Avenue West and 81 additional noise impacts from roadway changes to improve access to the Lynnwood Transit Center and from bus access to the transit center.

Alternative C1: 52nd Avenue West to 200th Street SW

Transit noise impacts would occur at single- and multifamily residences adjacent to the guideway and one church (the River of Life Christian Center), including noise impacts from a revised bus facility at the Lynnwood Park-and-Ride. An 800-foot-radius curve between Cedar Valley Road and 200th Street SW could cause wheel squeal. With Option 1 (median), impacts would occur at an additional eight residences along I-5 and 52nd Avenue West compared with Option 2 (west of I-5) because Option 2 would operate at a lower speed through the curve onto 52nd Avenue West. Option 2 also includes an 800-foot radius curve as the guideway turns from I-5 to 52nd Avenue West, which may generate wheel squeal.

Alternative C2: 52nd Avenue West to Lynnwood Transit Center Station

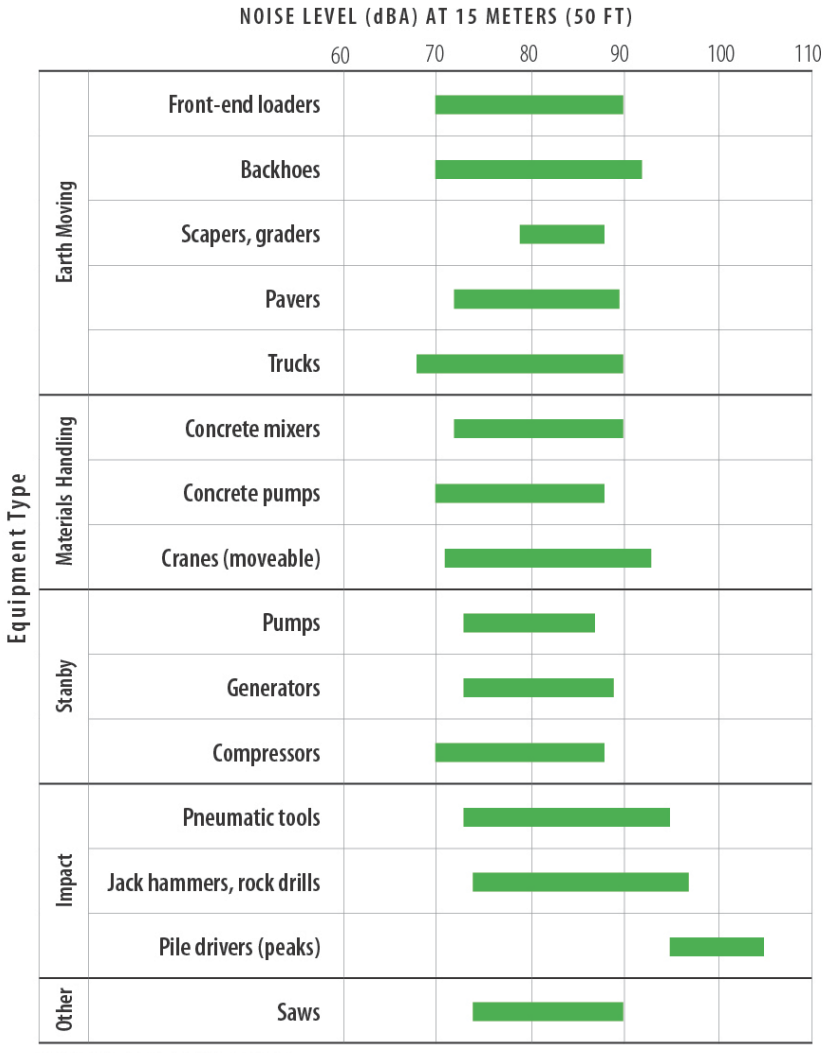
Alternative C2 would pass near fewer noise-sensitive properties than Alternative C1, although its initial section along 52nd Avenue West is the same. Properties that would experience transit noise impacts include single- and multifamily residences adjacent to the guideway and one church (the River of Life Christian Center). These impacts include residences affected by park-and-ride noise. Alternative C2 has the same two options for departing from I-5 as Alternative C1, with Option 1 (median) having more impacts than Option 2 (west of I-5). As with Alternative C1, Option 2 also includes an 800-foot radius curve as the guideway turns from I-5 to 52nd Avenue West, which may generate wheel squeal.

Alternative C3: Along I-5 to Lynnwood Park-and-Ride Station

Alternative C3 would have noise impacts similar to the Preferred Alternative. Option 1 (median) would have fewer impacts because the alignment would be located farther from residences along 52nd Avenue West and 53rd Avenue West. These impacts include residences affected by park-and-ride noise. Alternative C3 would not generate wheel squeal because it does not include any curves of less than 1,000 feet. With Alternative C3, there are two options for the Lynnwood Transit Center. Option 1, which maintains the current transit center configuration, would create noise impacts at 58 multifamily residential units, while Option 2, which would reconfigure the transit center around the light rail station, would create noise impacts at 12 multifamily residential units.

4.7.4 Construction Impacts

Construction-related noise, which is regulated by state or local ordinances, would be produced by earthmoving equipment, pneumatic tools, generators, concrete pumps, and similar equipment (Figure 4.7-6). While most construction activity would be completed during daytime hours, some activities, including any that would require lane closure of major roadways, including I-5, likely would be completed at night and would need noise permits or variances, as required by local ordinance. Construction impacts would be similar for all alternatives, but vary in time and location of the noise and vibration. Construction noise and vibration are evaluated in the *Noise and Vibration Technical Report*.



Source: EPA, 1971 and WSDOT, 1991.

Figure 4.7-6
Typical Construction Equipment Noise Levels

Construction would occur in several phases. During the loudest phases of work, which include demolition, grading, structure erection, and track installation, Leq noise levels would be approximately 88 dBA at 50 feet from the construction, with shorter work periods reaching 94 dBA. Each phase of guideway construction would occur over a short period in each area, with construction activities progressing from multiple starting points along the alignment. Areas requiring considerable demolition, grading, and construction activity would experience the longest periods of disruption.

Common sources of vibration during construction activities include jackhammers, pavement breakers, hoe rams, bulldozers, backhoes, and soil compactors. Pavement breaking and soil compacting would likely produce the highest levels of vibration.

Elevated sections would generally be constructed on drilled-shaft foundations, which generate less noise and vibration than driving piles. Limited pile driving could be required for some foundations and for retaining wall construction. Depending on soil conditions, pile driving could produce Lmax noise levels reaching 105 dBA at 50 feet, with vibration levels reaching a peak-particle velocity of 0.5 inch per second. No pile driving is anticipated within 80 feet of buildings. Pile driving conducted at more than 80 feet from buildings in the corridor would not damage buildings but could still cause temporary annoyance.

Segment A Alternatives

There are many single- and multifamily residences along the Segment A alternatives. At adjacent residences, maximum noise levels exceeding 80 dBA Lmax could occur for short periods of the day during some construction activities. In locations where the noise walls would conflict with the light rail tracks or guideway, replacing the noise walls could generate short periods of construction noise and increased traffic noise until the new walls are in place. Unless the replacement noise walls can be constructed prior to removal of the existing walls, and if temporary barriers are not practical, traffic noise levels would increase temporarily between approximately 5 and 10 dBA Leq. The affected noise wall locations are primarily in Segment A. In Segment A, the area that would experience the most guideway construction noise is between NE Northgate Way and North 117th Street. Station construction would produce similar noise levels as guideway construction, but constructing the station would occur over a longer period in the same location. The Preferred Alternative and Alternative A1 would widen or reconstruct the NE 185th Street bridge and include construction both east and west of I-5. Alternatives A5 and A7 would include the construction of a station and multi-story parking facility at NE 155th Street, which could result in a longer period of construction than alternatives without stations at this location. The NE 185th Street Station options with a parking garage

are more complex than options with surface parking and would have longer construction periods.

Guideway and station construction would not cause vibration damage to adjacent buildings unless vibratory pile driving occurs within 80 feet or vibratory rollers are used within 40 feet of sensitive structures. Vibration could cause annoyance at locations near stations where construction activity would occur over a longer period than that for guideway construction.

Segment B Alternatives

In Segment B, the area south of Ballinger Way would more likely experience guideway construction noise, as would the west side of I-5 in the western alignment for the Preferred Alternative and Alternative B2A. Alternatives B1 and B4 follow the median of I-5 for the majority of Segment B; therefore, construction noise with those alternatives would be farther from residences. Activities and noise levels would be similar to Segment A. The types of vibration impacts expected with any of the alternatives would be similar to Segment A.

Segment C Alternatives

In Segment C, the major noise sources would be associated with foundation, column, and guideway erection rather than grading activity and retaining wall construction. Alternatives C1 and C2 would cause more construction noise disruption than the Preferred Alternative and Alternative C3 because they are closer to residences. A crossing of the Scriber Creek stream and wetland complex could involve pile driving for the Preferred Alternative and Alternatives C2 and C3, which would be a source of temporary noise and vibration. Noise levels and typical vibration impacts would be similar to Segment A.

4.7.5 Indirect Impacts

Indirect effects of the project on noise and vibration could include noise or vibration caused by changes in development or travel patterns influenced by the project.

The project would lessen the future transportation demand on the roadway system compared to the No Build Alternative, but with or without the light rail project, traffic volumes and traffic noise would still be higher than today.

Transit-oriented development facilitated by the additional transportation options and accessibility provided by the project would generate noise consistent with the land use developed in accordance with local comprehensive plans and zoning regulations.

4.7.6 Cumulative Impacts

Previous projects have introduced noise and vibration sources in the corridor. The greatest existing source of noise in the corridor is I-5 and it will continue to be the major source. Areas that do not have existing or planned noise walls could experience increased traffic noise levels. Similarly, local roads will continue to be a source of noise or vibration in the corridor. Future expansion of I-5 and other transportation facilities envisioned in *Transportation 2040* (PSRC 2010a), including the Northgate Link Extension currently under construction, may contribute to future noise and vibration in the corridor.

In addition to the facilities identified in *Transportation 2040* (PSRC 2010a), the Sound Transit OMSF, with a site alternative in Lynnwood, could be an additional source of noise or vibration in the area; Sound Transit has identified a Bellevue site as the Preferred Alternative for that project. If constructed in Lynnwood, the OMSF would remove light industrial and commercial properties and replace them with the light rail guideway, surface tracks, and buildings, which could generate localized noise and vibration impacts. The OMSF would be farther from the closest sensitive receivers than would some of the Segment C light rail alternatives. In any event, in accordance with Sound Transit noise mitigation policy, severe and moderate impacts would be mitigated for both projects, and no cumulative effects are expected. If constructed concurrently with the Lynnwood Link Extension, construction of the OMSF could contribute additional temporary noise and vibration impacts.

The Edmonds School District's master plan includes developing a bus base and support services center in the same area. A large fleet of buses deployed from that site could cause higher noise levels for the area.

Some areas, such as in Lynnwood or Mountlake Terrace, may be redeveloped based on current local plans, placing more residential units or other noise-sensitive properties near the freeway or near the light rail project. Lynnwood Link Extension would be designed to avoid or mitigate noise impacts on existing noise-sensitive properties, but developers would need to consider light rail operations and ambient noise levels in the planning and design of future projects.

Because Sound Transit is mitigating all noise and vibration impacts (as defined by exceeding applicable FTA, state, or local criteria) created by the project, the project would not increase cumulative noise or vibration impacts, considering other current or future actions in the project area.

4.7.7 Potential Mitigation Measures

Depending on the combination of segment alternatives selected, if mitigation were not provided, the project would cause light rail noise impacts at 342 to 867 locations, local roadway access to park-and-rides and bus access noise impacts at 25 to 102

locations, and vibration impacts at 8 to 32 locations. However, Sound Transit will mitigate the as detailed in Table 4.7-6, are consistent with Sound Transit's Light Rail Noise Mitigation Policy (Motion No. M2004-08). The FTA manual also defines when mitigation is needed and bases this on the impact's severity, with severe impacts requiring the most consideration. Mitigation requirements for each alternative are summarized in Table 4.7-6; the specific locations and types of mitigation are detailed in the *Noise and Vibration Technical Report*.

When source mitigation measures, noise walls, or sound barriers are infeasible or not entirely effective at reducing noise levels below the FTA impact criteria or applicable requirement, then residential sound insulation would be evaluated and offered at properties where the existing building does not already achieve a sufficient exterior-to-interior reduction of noise levels.

All rail track curves of less than 1,000-foot radius near noise-sensitive land uses would be designed to accommodate a track lubrication system that Sound Transit would install should wheel squeal occur during operation.

Vibration impacts would be mitigated by design measures that reduce the amount of vibration energy transferred from passing trains into the ground. The use of a tire-derived aggregate (shredded tires) in a layer below the track ballast is an effective measure to reduce vibration transfer; other measures, such as ballast mats, a resiliently supported track, high-compliance rail fasteners, or column isolation, are also available and may be appropriate in some locations, such as on structures. Specific vibration-isolation designs to mitigate impacts to below the FTA criteria would be determined during final design.

Additional noise and vibration is generated at rail track cross-overs. Special trackwork, such as a movable-point or spring frog (a device that allows two rails to cross), would be used in place of a conventional frog where the cross-over would otherwise cause a noise or vibration impact.

During final design, all predicted noise and vibration levels and mitigation measures will be reviewed in further detail. If equivalent mitigation can be achieved by a less costly means or if the final design analysis shows no impact, then the mitigation measure may be modified or eliminated. Further noise mitigation will be provided if, after operations commence, noise impacts occur for which mitigation is deemed necessary and appropriate under FTA noise standards.

Table 4.7-6. Summary of Mitigation Measures for Noise Impacts

Alternative	Relocation of Noise Walls Required for Project Construction	Mitigation for Light Rail Noise Impacts after Relocating Noise Walls	Mitigation for Station and Park-and-Ride Access Impacts
Segment A Alternatives			
Preferred Alternative	Approximately 12,250 feet of relocated noise walls along I-5	Approximately 9,700 feet of additional noise walls. Insulation offered to 8 units.	Approximately 530 feet of noise walls at NE 185th Street Station.
A1	Approximately 7,900 feet of relocated noise walls along I-5	Approximately 11,200 feet of additional noise walls.	Approximately 530 feet of noise walls at NE 185th Street Station.
A3	Approximately 2,100 feet of relocated noise walls along I-5	Approximately 17,300 feet of additional noise walls. Insulation offered to 27 units.	Insulation offered to 9 residences at NE 185th Street Station.
A5	Approximately 8,200 feet of relocated noise walls along I-5	Approximately 11,000 feet of additional noise walls. Insulation offered to 8 units.	Approximately 200 feet of noise walls and insulation offered to 10 residences at NE 185th Street Station.
A7	Approximately 2,100 feet of relocated noise walls along I-5	Approximately 17,400 feet of additional noise walls. Insulation offered to 29 units.	Insulation offered to 9 residences at NE 185th Street Station.
A10	Approximately 8,100 feet of relocated noise walls along I-5	Approximately 11,500 feet of additional noise walls. Insulation offered to 3 units.	Approximately 200 feet of noise walls and insulation offered to 10 residences at NE 185th Street Station.
A11	Approximately 3,400 feet of relocated noise wall along I-5	Approximately 17,100 feet of additional noise walls. Insulation offered to 28 units.	Insulation offered to 9 residences at NE 185th Street Station.
Segment B Alternatives			
Preferred Alternative	None	Approximately 16,975 feet of additional noise walls. Insulation offered to 9 units.	Approximately 400 feet of noise walls at Mountlake Terrace Station.
Preferred Alternative – 220th Street Station Option	None	Approximately 16,975 feet of additional noise walls. Insulation offered to 9 units.	Approximately 400 feet of noise walls at Mountlake Terrace Station.
B1	None	Approximately 20,800 feet of additional noise walls.	Approximately 400 feet of noise walls at Mountlake Terrace Station.
B2A	None	Approximately 15,000 feet of additional noise walls. Insulation offered to 3 units.	Approximately 400 feet of noise walls at Mountlake Terrace Station.
B4	None	Approximately 20,000 feet of additional noise walls.	Approximately 400 feet of noise walls at Mountlake Terrace Station.
Segment C Alternatives			
Preferred Alternative	None	Approximately 3,960 feet of additional noise walls.	Insulation offered to 58 residential units. Approximately 1,275 feet of noise walls or insulation offered to an additional 23 residential units to address traffic noise.
C1, either option	None	Approximately 7,200 feet of additional noise walls.	Insulation offered to 51 residential units.
C2, either option	None	Approximately 6,600 feet of additional noise walls.	Insulation offered to 58 residential units.
C3, either option	None	Approximately 1,700 feet of additional noise walls.	Insulation offered to between 12 and 58 residential units.

Segment A Alternatives

In Segment A, most of the at-grade alignments near residential areas would be protected by noise walls that would be relocated from their existing locations along I-5 to outside of the track alignment as part of the project design. Replacement noise walls would be between 6 and 24 feet in height to mitigate the combination of projected I-5 traffic noise levels resulting from the removal of the existing noise walls, changes to ramps and shielding, and light rail noise introduced by the project to below the impact criteria. Sound Transit would incorporate a 4-foot-tall to 8-foot-tall barrier at the edge of the structure closest to the noise-sensitive uses to mitigate most noise impacts from light rail operating on an elevated structure. Mitigation would reduce noise levels at nearby receivers, including areas already below applicable impact criteria.

Sound Transit would provide sound insulation at up to eight residences with the Preferred Alternative, none for Alternative A1, and at up to 38 residences with Alternatives A3, A5, A7, A10, or A11. Sound insulation would be provided where other standard measures that mitigate outdoor noise impacts are not completely effective.

The project would include vibration-reduction measures in several locations to reduce vibration levels to below FTA impact criteria.

Mitigation for impacts from buses and cars operating in the NE 185th Street park-and-rides would include noise barriers along the edge of the facility, sound insulation, or revising the design of the facility to move access driveways and bus loading areas farther from residences.

Segment B Alternatives

In Segment B, the project would include at-grade noise walls to reduce impacts on adjacent receivers for at-grade sections of the alignment. For the Preferred Alternative, the walls would range between 4 and 10 feet above the track height, or from the top of retaining walls built as part of the project. Walls for the other alternatives would range from 4 feet above retaining walls to at least 8 feet above track height. Alternative B1 would have the most walls, including 4-foot to 6-foot walls along both sides of the track in some locations to reduce noise from operation in the median of I-5 to below the FTA impact criteria.

The elevated sections of guideway would require additional mitigation. Sound Transit would incorporate a 4-foot-tall to 6-foot-tall barrier at the edge of the elevated guideway to reduce noise to below the FTA criteria. This would reduce noise levels at nearby properties, including those where levels would already be below the impact criteria. Sound Transit would provide sound insulation to nine residences with the Preferred Alternative and three residences with Alternative B2A.

The project would include vibration-reduction measures in several locations to reduce vibration levels to below FTA impact criteria.

For all alternatives, mitigation measures, such as a noise wall along the eastern edge of the facility, would alleviate noise impacts from buses serving the Mountlake Terrace Station park-and-ride.

Segment C Alternatives

In Segment C, all alternatives would be built on an elevated structure. Sound Transit would incorporate a 4-foot-tall to 6-foot-tall barrier at the edge of the structure to reduce noise caused by the elevated guideway to below FTA criteria.

Sound Transit would mitigate impacts from buses and passenger vehicles operating within the Lynnwood Transit Center Park-and-Ride with sound insulation of up to 58 residences for all alternatives, or through circulation or operational changes, such as revising the design for bus access. Roadway changes to improve access to the Lynnwood Transit Center as part of the Preferred Alternative would cause noise impacts at 23 multi-family residences that would be mitigated with noise walls along 200th Street SW and with sound insulation.

The project would include vibration-reduction measures in several locations to reduce vibration levels to below FTA impact criteria. Sound Transit would include resilient supports and column isolation for Alternatives C1 and C2 to avoid vibration impacts to businesses at 20815 52nd Avenue West in Lynnwood.

Construction

Sound Transit would reduce construction noise and vibration impacts with operational methods and scheduling, equipment choice, and acoustical treatments. In locations where existing noise walls must be relocated, the relocation would be completed as early in the construction process as practical so that the relocated walls would reduce noise from the ongoing construction activities. When required, Sound Transit or its contractor would seek the appropriate noise variance from the local jurisdiction. Construction noise and vibration control mitigation will include the following measures, as necessary, to meet required noise limits and minimize vibration:

- Install construction site noise barrier or noise wall by noise-sensitive receivers where feasible and appropriate.
- Use smart backup alarms during nighttime work that can be automatically adjusted, or lower the alarm level or tone based on the background noise level, or switch off back-up alarms and replace with spotters.
- Use low-noise emission equipment.

- Implement noise-deadening measures for truck loading and operations.
- Monitor and maintain equipment to meet noise limits.
- Use lined or covered storage bins, conveyors, and chutes with sound-deadening material.
- Use acoustic enclosures, shields, or shrouds for equipment and facilities.
- Install high-grade engine exhaust silencers and engine-casing sound insulation.
- Prohibit aboveground jackhammering and impact pile driving during nighttime hours.
- Minimize the use of generators or use whisper-quiet generators to power equipment.
- Limit use of public address systems.
- Use movable noise barriers at the source of the construction activity, where appropriate.
- Limit or avoid noisy or high vibration activities during nighttime hours.
- Demolish existing structures near vibration-sensitive receivers with methods that do not cause impact forces against the buildings or near them.
- Minimize use of vibratory soil compactors and vibratory hammers near vibration-sensitive receivers.
- Use oscillatory pile-casing techniques where appropriate.
- Avoid using variable-frequency vibratory hammers in dense residential areas, such as around the NE 130th Street, NE 145th Street, NE 155th Street, and NE 185th Street Stations.
- Avoid conventional vibratory hammers; an alternative to conventional vibratory pile drivers is a resonance-free vibrator or variable eccentric moment vibrator.

4.8 Ecosystem Resources

An ecosystem is defined by the interaction between plants, animals, microorganisms, and the physical environment in which they live. Ecosystems are made up of living organisms, including humans, and the areas they inhabit. This section addresses the ecosystem components—aquatic species and habitat; vegetation, terrestrial wildlife, and wildlife habitat; and wetlands—in the vicinity of the Lynnwood Link Extension alternatives. The *Ecosystem Resources Technical Report* has detailed background information about the methods, affected environment, species, and impacts discussed in this section.

4.8.1 Affected Environment

The study area for ecosystems includes all species and habitat within 200 feet of the project alternatives or features, as well as areas up to 100 feet upstream and 300 feet downstream of any sites where any of the proposed alignments would cross a stream.

Aquatic Species and Habitat

The aquatic resources in the study area are primarily in urban areas, and most of the aquatic habitats have already been changed by development. While conditions vary from stream to stream, the greatest changes are in areas with the most urban development, including roads, freeways, and urban centers. Flows from some of the smaller streams and headwater reaches are channeled through pipes and ditches, thereby changing the natural flow patterns and processes such as groundwater recharge.

Three stream systems drain the study area: Thornton Creek, McAleer Creek, and Scriber Creek (Figures 4.8-1a through 4.8-1c). All three streams drain to Lake Washington. Many species of native and introduced fish, including species listed under the Endangered Species Act (ESA), inhabit Lake Washington and its tributary streams. These waterways also provide essential fish habitat for federally managed species; such habitat is protected under the Magnuson-Stevens Fishery Conservation and Management Act. The streams, stream habitats, and fish species that occur in the study area are described in greater detail in the *Ecosystem Resources Technical Report.*

In addition to Thornton Creek, McAleer Creek, and Scriber Creek, the Lynnwood Link Extension study area includes five tributaries to those streams (Table 4.8-1).

Thornton Creek supports populations of several salmonid fish species, although most are prevented from using stream habitats in the study area because downstream barriers to fish passage are present. The salmonid species most likely to use Thornton Creek stream habitats in the study area are resident cutthroat trout (*Oncorhynchus clarkii*) and rainbow trout (*O. mykiss*). Observers have found steelhead trout (the anadromous, or ocean-going, form of rainbow trout) in Thornton Creek upstream of the study area, but it is not known whether steelhead spawn there. The quality of Thornton Creek's in-stream habitat and riparian habitat within the study area is considered poor, based on channel morphology, sediment regime, existing physical habitat conditions, and degraded riparian habitat conditions.

Table 4.8-1. Streams in the Lynnwood Link Extension Study Area

Stream Name [a]	Local Jurisdiction	Local Jurisdiction Stream Classification [b]	Local Jurisdiction Buffer Width (feet) [c]	Fish Species Documented in the Study Area
Thornton Creek, North Branch	Seattle	Type 3	75 [d]	Steelhead Cutthroat Trout Rainbow Trout
Thornton Creek Tributary (SSE1)	Seattle	Type 3	75 [d]	none
McAleer Creek	Shoreline Mountlake Terrace	Type II Class II	115 100	Coho Salmon Chinook Salmon Steelhead Cutthroat Trout
McAleer Creek Tributary (SSH2)	Shoreline	Piped	10	none
McAleer Creek Tributary (SSH4)	Shoreline	Type III	65	none
McAleer Creek Tributary (SMT1)	Mountlake Terrace	Class III / Class V	65 / 0	none
Scriber Creek	Lynnwood	Category I	100	Coho Salmon Cutthroat Trout
Scriber Creek Tributary (SLY1)	Lynnwood	Category III	35	none

[a] Streams other than Thornton Creek, McAleer Creek, and Scriber Creek are identified with alphanumeric codes: SYYn. S = stream; YY = two-letter code for local jurisdiction (SE = Seattle, SH = Shoreline, MT = Mountlake Terrace, LY = Lynnwood); n = sequential identification number.

[b] Identification and classification of streams in this analysis represent conservative estimates, based on available information and the provisions of local critical areas rules (Seattle Municipal Code 25.09.020 (D5), Shoreline Municipal Code 20.80.470, Mountlake Terrace Municipal Code 16.15.080, and Lynnwood Municipal Code 17.10.060). Some of the watercourses identified in this analysis may not actually be defined as streams by the local jurisdictions, or they may be assigned smaller buffers. Actual impacts would be analyzed and mitigated as appropriate through local permitting processes.

[c] Seattle Municipal Code 25.09.200.A.3.d.1; Shoreline Municipal Code 20.80.480; Mountlake Terrace Municipal Code 16.15.090; Lynnwood Municipal Code 17.10.061

[d] Note that the Seattle Municipal Code applies development restrictions and specifies mitigation requirements only within environmentally critical areas or buffers on publicly or privately held parcels. The locations where the proposed alignments would cross Thornton Creek and pass near Stream SSE1 are within the right-of-way for I-5 and are therefore not subject to City of Seattle buffer requirements. For this analysis, the regulatory buffer width is used to identify potential impacts to the riparian buffer for Thornton Creek. Mitigation requirements would be developed through local permitting processes.

McAleer Creek supports salmon and trout as far upstream as Lake Ballinger, and parts of the stream provide spawning and rearing habitat for coho salmon (*O. kisutch*). Observers have seen steelhead and cutthroat trout spawning in McAleer Creek approximately 200 feet downstream of the study area, and Chinook salmon (*O. tshawytscha*) farther downstream. The creek's habitat quality varies by location, and several sections are separated by culverts. Immediately downstream of the study area, the in-stream habitat is rated poor, based on the preponderance of fine sediments and scouring and incision resulting from bank hardening. Riparian (or streamside) habitat quality where the stream has an open channel in the study area is generally good, with forest canopy that provides shade and woody debris for channel complexity.

Three tributaries meet McAleer Creek in the study area. One tributary (Stream SSH2) passes under I-5 south of SR 104 and is entirely within culverts in the study area.

Another tributary (Stream SSH4) emerges from a culvert in the cloverleaf interchange between SR 104 and I-5, then flows approximately 30 feet before joining McAleer Creek. The third tributary (Stream SMT1), which originates in Veterans Memorial Park in Mountlake Terrace, is partly within culverts and joins McAleer Creek near I-5. All of the tributaries flow only intermittently. Based on the presence of human-created barriers to fish passage, neither SSH2 nor SMT1 is known or expected to support fish under current conditions, although the basin sizes, channel widths, and gradients of both streams suggest the potential to support fish. From McAleer Creek, fish can enter the surface-flowing segment of SSH4 in the study area.

In Scriber Creek, coho salmon have been observed upstream of the study area and cutthroat trout use stream habitats as far upstream as Scriber Lake Park. However, a beaver dam about 0.5 mile downstream of the study area impedes access by other salmonid species to reaches of Scriber Creek in the study area. The Washington Department of Fish and Wildlife (WDFW) has classified the dam as a total barrier to fish passage. Spawning habitat quality in Scriber Creek within the study area is generally poor due to limited canopy and vegetative cover, the presence of bank armoring, and the abundance of silt and other fine substrates; however, some side channels may provide suitable rearing habitat. For much of its length in the study area, the stream channel is braided and indistinct as it flows through the large wetland complex south and west of the Lynnwood Transit Center. Based on input provided by Ecology staff who collaborated on field delineations in July 2014, the ordinary high water mark of Scriber Creek through the wetland complex is defined as encompassing the entire breadth of the complex.

An intermittent tributary (Stream SLY1) flows south along the eastern edge of the Lynnwood Transit Center and under I-5 to join Scriber Creek southeast of I-5. For most of its length the tributary is contained within culverts or ditches. Most of its water comes from urban runoff, and the habitat quality is generally poor due to degraded water quality and flows that peak abruptly and fall off rapidly after rain events. Based on the presence of human-created barriers to fish passage, the tributary is not currently known to support fish, but based on its basin size, channel width, and stream gradient, it may have the potential to support fish.

Four aquatic species that have federal or state listing status, or that are candidates for listing, might use habitats in the study area:

- Chinook salmon is listed as threatened under the ESA and is a state candidate species.
- Steelhead trout is listed as threatened under the ESA.
- Bull trout (*Salvelinus confluentus*) is listed as threatened under the ESA and is a state candidate species.
- River lamprey (*Lampetra ayresii*) is a state candidate species.

Of these species, only steelhead trout are known to occur in the study area, but river lampreys are also likely. Based on the lack of suitable habitat and the presence of fish passage barriers downstream of the study area, bull trout are not expected to use any streams in the study area. Although habitat conditions in McAleer Creek are unfavorable for Chinook salmon, and none have been documented in the study area, their presence in the lower reaches of the stream suggests the possibility that Chinook salmon could use McAleer Creek in the study area. Additional information about ESA-listed species in the study area is available in the Biological Assessment prepared for this project (Appendix O).

Vegetation, Terrestrial Wildlife, and Wildlife Habitat

The study area has a mix of urban and more natural vegetation types. Table 4.8-2 identifies the six land cover types in the study area and describes the amount of area covered by each type. The geographic distribution of these cover types is shown in Figures 4.8-1a through 4.8-1c. Most of the study area is dominated by land cover types (Urban Areas, Residential Areas, Maintained Vegetation) where reduced structural complexity and high levels of human activity result in low habitat quality for wildlife. Comparatively natural land cover types (i.e., Forest and Shrub) are found in approximately 20 percent of the study area (Table 4.8-2). More detailed information about vegetation and wildlife resources in the study area is provided in the *Ecosystem Resources Technical Report.*

Much of the study area consists of roadways (including I-5) and commercial, industrial, and residential areas. Such areas provide habitat primarily for species that can coexist with humans and that do not depend on large blocks of relatively undisturbed native vegetation. Most land cover types in the study area offer potential nesting habitat for bird species that are protected under the Migratory Bird Treaty Act. Red-tailed hawks (*Buteo jamaicensis*) and other raptors prey on voles (*Microtus* spp.) that are found in abundance in the grassy vegetation in the I-5 right-of-way. Patches of forest and other native habitat types in the study area are isolated from other areas of similar habitat and generally do not serve as connective corridors to other areas of habitat outside of the study area.

The largest area of native habitat in the study area is the wetland/stream complex located near the Lynnwood Transit Center (also called the Scriber Creek wetland complex). Vegetation and other features in the wetland complex provide habitat for many species of songbirds, mammals, and amphibians. Waterfowl use areas of slow-moving water, and snags throughout the complex show evidence of recent excavation by woodpeckers. The wetland complex is surrounded on all sides by residential and commercial developments, roads, and highways, limiting its value for wildlife species that require large, undisturbed areas and undeveloped travel corridors. Animals that use habitats in

the Scriber Creek wetland complex are likely accustomed to relatively high levels of human activity.

Table 4.8-2. Land Cover Types in the Lynnwood Link Extension Study Area

Land Cover Type	Description	Acres in Study Area
Forest	Areas dominated by evergreen conifers, deciduous broadleaf trees, or a mixture of both, generally greater than 20 feet tall. Canopy cover variable but typically greater than 40 percent. Understories include shrubs, forbs, and/or grasses.	89
Shrub	Areas dominated by native or non-native shrubs. May include trees (particularly red alder) singly or in patches.	59
Maintained Vegetation	Typically, exotic grasses or annuals, such as mown grasses and other low vegetation, most of which are rarely allowed to go to seed. Includes stormwater detention areas.	62
Residential Areas	Houses and yards, including lawns, ornamental plantings, and pruned trees. Tree and shrub canopy cover generally less than 30 percent. Moderate to high levels of human disturbance. Snags, woody debris, and other natural structures are essentially non-existent.	171
Urban Areas	Roadways, parking lots, and other areas dominated by impervious surfaces. Little or no vegetation present.	309
Open Water	Areas of ponding, including natural lakes, streams, and stormwater ponds. All open water in the study area is fresh water.	<1
Total Area		**690**

No terrestrial ESA-listed or state-listed threatened or endangered plant or wildlife species are known or expected to occur in the study area, but several state-listed sensitive species and candidate species may use habitats in the study area. The state lists bald eagle (*Haliaeetus leucocephalus*) and peregrine falcon (*Falco peregrinus*) as sensitive species, and the candidate species are Townsend's big-eared bat (*Corynorhinus townsendii*), western toad (*Anaxyrus boreas*), pileated woodpecker (*Dryocopus pileatus*), and Vaux's swift (*Chaetura vauxi*). There are no documented observations of any of these species in the study area, although biologists conducting field reviews observed evidence of pileated woodpecker activity in some wooded areas within and adjacent to the study area.

Wetlands

Sound Transit identified 37 wetlands in the study area (see Figures 4.8-1a through 4.8-1c; individual wetlands are described in the *Ecosystem Resources Technical Report*). On parcels where rights-of-entry were available, wetlands within 100 feet of the footprint of the Preferred Alternative were formally delineated and rated according to local regulations and the *Washington State Wetland Rating System for Western Washington*. Some other wetlands, including those within public rights-of-way near any of the other light rail alternatives, were mapped and rated as well. Wetlands outside of public rights-of-way and more than 100 feet from the footprint of the Preferred Alternative were identified via existing documentation and public vantage points. All the wetlands are in areas where the natural environment has been altered by urban development.

Many are within maintained rights-of-way where they receive stormwater runoff from pipes, ditches, or overland flow, but groundwater, precipitation, and nearby streams also provide a source of water. With one exception, all of the wetlands in the study area have relatively low quality ratings (Category III or IV), indicating moderate to low levels of wetland function and moderate to high levels of disturbance. The exception is a Category II wetland associated with Scriber Creek. This large wetland/stream complex located near the Lynnwood Transit Center provides multiple water quantity, water quality, and habitat functions. Most of the wetlands in the study area are small (less than 0.5 acre), but a few are larger, including the 17-acre wetland associated with Scriber Creek.

4.8.2 Long-Term Impacts

Construction and operation of the Lynnwood Link Extension could have long-term impacts on ecosystem resources. For aquatic species and habitat, such impacts may include permanent loss or degradation of in-stream or riparian habitat, altered hydrology, or water quality degradation. Construction of at-grade or elevated guideways near streams would preclude the development of mature forest habitat in those areas, reducing the potential for the recruitment of large woody debris to nearby streams. Long-term impacts on vegetation, wildlife, and wildlife habitat may include permanent loss or degradation of terrestrial habitat (including habitat connectivity); disturbance due to increased human access, noise, and light; or contributions to the spread of noxious or invasive plant species. Wetlands and buffers in the study area may also experience permanent loss or degradation.

To comply with ESA requirements, FTA initiated consultation with the U.S. Fish and Wildlife Service and National Oceanic and Atmospheric Administration Fisheries Service (NOAA Fisheries) concerning the potential effects of the proposed project on ESA-listed species and critical habitat. Sound Transit prepared a Biological Assessment (see Appendix O) to serve as the basis for the consultation. The Biological Assessment was sent to the U.S. Fish and Wildlife Service and NOAA Fisheries on December 22, 2014. Based on the analysis in that document, including its proposed mitigation measures, FTA determined that construction of the Lynnwood Link Extension may affect, but is not likely to adversely affect, ESA-listed species and critical habitat. The Biological Assessment also included a proposed determination of "no adverse effect" on essential fish habitat protected under the Magnuson-Stevens Fishery Conservation and Management Act. NOAA Fisheries concurred with these determinations on January 27, 2015, and the U.S. Fish and Wildlife Service concurred on January 29, 2015.

Under the Preferred Alternative or any of the other light rail alternatives, construction and operation of guideways, stations, and ancillary features would have direct effects on in-stream habitat only in Scriber Creek and possibly Stream SMT1.

Under any of the light rail alternatives, guideways, stations, and other project features would be elevated at all open stream crossings. Except for the area within the Scriber Creek wetland complex and possibly SMT1, the project would be outside of the ordinary high water mark of all streams (see discussion of the Segment B alternatives later in this section for more about SMT1). Based on the preliminary determination that the ordinary high water mark of Scriber Creek coincides with the outer boundary of the wetland complex, the support columns for the elevated guideway in that area would be within the aquatic habitat of Scriber Creek. Potential construction-related impacts are discussed in Section 4.8.3, below.

No impacts on fish passage are anticipated because no new culverts would be added in any streams and no existing culverts would be extended. Sound Transit would use native vegetation when replanting areas disturbed by construction. At sites where riparian zones are currently dominated by non-native species, the reintroduction of native vegetation could lead to long-term improvements in riparian habitat conditions.

Stormwater from all project-related impervious surfaces would receive appropriate flow control; stormwater from pollutant-generating impervious surfaces would also receive water quality treatment. The light rail alternatives would be designed to meet standards of the applicable jurisdiction and Ecology's Stormwater Management Manual for Western Washington. If a local jurisdiction has more stringent design requirements than those in the Stormwater Management Manual, then Sound Transit would apply the local requirements in the applicable areas. Based on the analysis for water resources (Section 4.9, Water Resources), none of the light rail alternatives would degrade existing water quality conditions. Discharges from stormwater detention facilities could periodically increase water velocities in receiving waters. This could potentially reduce the availability of salmonid prey and displace juvenile fish from cover.

Based on the quality of existing habitat in most portions of the study area[2], the operation of any of the light rail alternatives would not result in long-term adverse effects on the viability of local wildlife populations. Currently, the predominant types of land cover in the project footprint for any of the light rail alternatives are Urban Areas, Residential Areas, and Maintained Vegetation. Little or no vegetation is present in areas classified as Urban. The vegetation that is present in these three types of land cover is highly modified from predevelopment conditions and dominated in many areas by invasive species. In addition, habitat in these areas

[2] Section 4.5 (Visual and Aesthetic Resources) identifies changes in visual quality in some areas due to the loss of dense vegetation cover. Note that these visual impacts would not equate to adverse effects on ecosystem resources because the current habitat value of the affected areas is low. Although changes to low-value habitat may be noticeable to human observers, the impact of such changes on ecosystem functions would be minimal.

occurs along roads and other areas with low value for wildlife. Because the light rail alternatives would be built alongside the I-5 corridor (an existing impediment to migration by terrestrial species), they would not affect areas that serve as connective corridors to other areas of habitat outside of the study area.

Although the potential for adverse effects would be low, operation of any of the light rail alternatives could result in some adverse effects on vegetation and wildlife over the long term. For example, maintenance activities that involve the removal of vegetation or structures that support bird nests (e.g., bridges, overpasses) during the breeding season could destroy nests, eggs, or birds protected under the Migratory Bird Treaty Act. At-grade guideways and other facilities in grassy areas (e.g., along the margins of I-5) would reduce the amount of habitat for voles and other species that are prey for raptors. In addition, disturbance of comparatively natural land cover types in the study area could have some adverse effects, as discussed below.

For this analysis, the amount of Forest cover affected by each light rail alternative is used to indicate the potential for long-term adverse effects on vegetation and wildlife. Construction of project features would have a greater likelihood of reducing the habitat quality of forested areas than other cover types. The removal of trees, snags, and understory vegetation would result in a loss of potential nesting sites, foraging sites, and hiding cover for many species of birds and small mammals. The introduction of cleared areas through patches of contiguous forest cover would fragment the forested habitat. Project construction in some areas classified as Shrub would also diminish the structural and biotic diversity associated with the variety of plant and wildlife species previously present in the cleared areas. The areas where the potential for adverse effects would be greatest are those dominated by native species. These areas generally occur near patches of Forest land cover. For example, most areas dominated by native shrub species in the Scriber Creek wetland complex occur near areas of Forest cover. Alternatives that affect a greater amount of Forest cover would also affect a greater amount of native Shrub cover.

Based on the existing high levels of noise and vehicle traffic on I-5, as well as human activity associated with residential and commercial development in the study area, wildlife that use habitats adjacent to the light rail alternatives are likely accustomed to noise and human activity. The potential is therefore low for any of the light rail alternatives to cause disturbance due to increased human access, noise, and light. Minor localized movements of some species may occur, but would not affect their viability. In addition, operation of the light rail system would not result in any long-term increases in nighttime illumination of fish-bearing waters or cause increases in predation on juvenile salmon, should any be present.

The light rail alternatives would have direct, long-term impacts on wetlands where the project footprint crosses wetlands or buffers. Indirect, long-term impacts might also occur due to construction and operation activities, such as modification of

vegetation, partial shading, water quality degradation, and alteration of wetland hydrology sources.

This impact assessment is based on the information obtained from overlaying the conceptual designs for the light rail alternatives onto ecosystem resource base maps and applying an additional buffer (10 to 12 feet) to account for other features such as noise walls and retaining walls. Not all areas within this analytical buffer would be subject to long-term impacts; some areas would be unaffected under the light rail alternatives or would be subject only to temporary impacts during construction. The acreage values resulting from this analytical approach provide a reasonable indication of the nature and magnitude of potential impacts and reflect differences among alternatives (Table 4.8-3). To provide a conservatively high estimate of impacts, all impacts within these areas are considered to be long term for this analysis.

Although these analytical buffers represent a conservative estimate of the areas where long-term effects may occur, some impacts could take place outside of these areas. For example, some trees in areas adjacent to the analytical buffer may need to be removed to protect light rail safety and reliability. Removal of such hazard trees may accompany construction of any of the light rail alternatives, and hazard tree removal would continue as a maintenance activity during the operational life of project facilities.

Some of the areas identified as long-term impacts occur where the guideway and other features would be elevated, spanning areas of vegetation and other resources. Although construction of elevated structures can minimize the amount of permanent ground disturbance, the amount of water and sunlight available to the vegetation underneath would likely be reduced. Because the elevated guideway structures would be relatively narrow (about 30 feet wide) and more than 15 feet above the ground surface in most places, shading and other impacts on vegetation would likely be minimal. As observed on the Sound Transit Central Link project, herbaceous plants and shrubs are generally able to grow beneath narrow guideways that are at least 15 feet above the ground (Sound Transit 2011d), as long as there is a source of water.

Figures 4.8-1a through 4.8-1c depict the locations of potential long-term impacts of the light rail alternatives on aquatic resources, vegetation, wildlife, and wetlands; Table 4.8-3 summarizes these impacts. Although individual wetlands and other resource areas would be adversely affected by project construction and operation under the light rail alternatives, these effects would be offset through the implementation of compensatory mitigation as required by federal, state, and local regulatory agencies.

Table 4.8-3. Summary of Potential Long-Term Impacts on Aquatic Resources, Vegetation and Wildlife, and Wetlands by Segment Alternative

Segment/Alternative	Aquatic Resources [a, b] (total acres)	Vegetation / Wildlife [c] (total acres)	Wetlands / Wetland Buffer (total acres)	Wetlands Affected [b, d]
Segment A: Seattle to Shoreline				
Preferred Alternative: At-grade/ Elevated with NE 145th and NE 185th Stations	Thornton Creek (0.5) SSE1 (0.2)	2	0.9 / 0.3	WSE1[e], WSE3, WSE4[e], WSE5, WSE6, WSE7[e], WSE8[e], WSH1, WSH2, WSH3, PWSH4
Alternative A1: At-grade/ Elevated with NE 145th and NE 185th Stations	Thornton Creek (0.5) SSE1 (0.2)	2	0.9 / 0.3	
Alternative A3: Mostly Elevated with NE 145th and NE 185th Stations	Thornton Creek (0.5) SSE1 (0.2)	1	0.9 / 0.3	
Alternative A5: At-grade/Elevated with NE 130th, NE 155th, and NE 185th Stations	Thornton Creek (0.5) SSE1 (0.2)	2	0.9 / 0.8	WSE1[e], WSE3, WSE4[e], WSE5, WSE6, WSE7[e], WSE8[e], WSH1[e], WSH2, WSH3, PWSH4, PSWH5[e]
Alternative A7: Mostly Elevated with NE 130th, NE 155th, and NE 185th Stations	Thornton Creek (0.5) SSE1 (0.2)	1	0.9 / 0.8	
Alternative A10: At-grade/Elevated with NE 130th, NE 145th, and NE 185th Stations	Thornton Creek (0.5) SSE1 (0.2)	2	0.9 / 0.3	WSE1[e], WSE3, WSE4[e], WSE5, WSE6, WSE7[e], WSE8[e], WSH1, WSH2, WSH3, PWSH4
Alternative A11: Mostly Elevated with NE 130th, NE 145th, and NE 185th Stations	Thornton Creek (0.5) SSE1 (0.2)	2	0.9 / 0.3	
Segment B: Shoreline to Mountlake Terrace				
Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side	McAleer Creek (0.5) SMT1 (0.5) SSH2 (<0.1) SSH4 (<0.1)	11	0.8 / 1.6	WSH5, WMT1[e], WMT2[e], WMT3[e], WMT5, WMT6, WMT7, WMT10[e], WMT11[e], PWLY3[e]
Preferred Alternative: East Side to Mountlake Terrace Transit Center to West Side with 220th Street Station South Option	McAleer Creek (0.5) SMT1 (0.5) SSH2 (<0.1) SSH4 (<0.1)	11	0.5 / 1.6	WSH5, WMT1[e], WMT2[e], WMT3[e], WMT6, WMT7, WMT10[e], WMT11[e], PWLY3[e]
Alternative B1: East Side to Mountlake Terrace Transit Center to Median	McAleer Creek (0.5) SMT1 (0.5) SSH2 (<0.1) SSH4 (<0.1)	5	<0.1 / 0.9	WSH5, WMT1[e], WMT2[ee], WMT11[e]
Alternative B2A: East Side to Mountlake Terrace Transit Center to West Side with Optional 220th Street SW Station	McAleer Creek (0.5) SMT1 (0.5) SSH2 (<0.1) SSH4 (<0.1)	11	1.6 / 1.3	WSH5, WMT1[e], WMT2[e], WMT3[e], WMT5, WMT6[d], WMT7, WMT10[e], WMT11[e], PWLY3[f]
Alternative B4: East Side to Mountlake Terrace Freeway Station to Median	McAleer Creek (0.7) SSH2 (<0.1) SSH4 (<0.1)	3	0.2 / 0.7	WSH5, WMT1, WMT2, WMT9[e], WMT10

Table 4.8-3. Summary of Potential Long-Term Impacts on Aquatic Resources, Vegetation and Wildlife, and Wetlands by Segment Alternative

Segment/Alternative	Aquatic Resources [a, b] (total acres)	Vegetation / Wildlife [c] (total acres)	Wetlands / Wetland Buffer (total acres)	Wetlands Affected [b, d]
Segment C: Mountlake Terrace to Lynnwood				
Preferred Alternative: Along I-5 to Lynnwood Park-and-Ride Station	Scriber Creek (0.5)[f]	2	0.7 / 1.0	WLY3, WLY4, WLY7
Alternative C1: 52nd Avenue West to 200th Street SW (Option 1—Median)	Scriber Creek (0.2)	1	<0.1 / 0.7	WLY3[e], WLY4, PWLY5[e]
Alternative C1: 52nd Avenue West to 200th Street SW (Option 2—West of I-5)	Scriber Creek (0.2)	1	0.2 / 1.1	WLY3, WLY4, PWLY3[e], PWLY5[e]
Alternative C2: 52nd Avenue West to Lynnwood Transit Center Station (Option 1—Median)	Scriber Creek (0.9)[f] SLY1 (0.1)	<1	0.9 / 0.6	WLY3[e], WLY4
Alternative C2: 52nd Avenue West to Lynnwood Transit Center (Option 2—West of I-5)	Scriber Creek (0.9)[f] SLY1 (0.1)	1	1.1 / 1.1	WLY3, WLY4, PWLY3[e]
Alternative C3: Along I-5 to Lynnwood Park-and-Ride Station (Option 1—Median)	Scriber Creek (0.1)[f] SLY1 (0.1)	1	0.2 / 1.0	WLY4, WLY7[e], WLY8[e], PWLY1
Alternative C3: Along I-5 to Lynnwood Park-and-Ride Station (Option 2—West of I-5)	Scriber Creek (0.1)[f] SLY1 (0.1)	2	0.3 / 1.7	WLY3, WLY4, WLY7[e], WLY8[e], PWLY1, PWLY3[e]

[a] The potential for adverse effects on aquatic resources is indicated by the acres of project footprint within each local jurisdiction's regulatory buffer area for specified streams.

[b] Streams (other than Thornton Creek, McAleer Creek, and Scriber Creek), wetlands, and potential wetlands (i.e., wetlands that were identified via existing documentation but not confirmed through site visits) are identified with alphanumeric codes: SYYn and WYYn. S = stream and W = wetland; YY = two-letter code for local jurisdiction (SE = Seattle, SH = Shoreline, MT = Mountlake Terrace, LY = Lynnwood); n = sequential identification number.

[c] For the reasons identified in the discussion of long-term effects above, the potential for adverse effects on vegetation and wildlife is indicated by the acres of project footprint that overlap with areas classified as Forest land cover.

[d] Impacts to Wetland WMT6 under Alternative B2A could exceed 0.5 acre, potentially triggering additional Clean Water Act permitting requirements, if the impacts cannot be reduced by avoidance measures.

[e] Wetlands that would be affected by buffer impacts only.

[f] The portions of Scriber Creek that would be crossed by the Preferred Alternative and Alternatives C2 and C3 are within the Scriber Creek wetland complex. Based on the preliminary determination that the ordinary high water mark of the stream coincides with the boundary of the wetland complex, potential impacts to aquatic resources in Scriber Creek are calculated as the area of the project footprint overlapping the wetland complex. Stream buffer impacts are described qualitatively in the accompanying text. The *Ecosystem Resources Technical Report* provides additional detail.

No Build Alternative

The No Build Alternative would not have any direct long-term impacts on ecosystem resources. Conversely, implementing the No Build Alternative would not have beneficial effects over the long term. The potential environmental benefits that would not be realized under the No Build Alternative include reduced motor vehicle traffic in the region; possible improvements for past impacts or poorly functioning environmental features along the corridor that have degraded water quality, wetlands,

streams, and regulatory buffers; as well as more concentrated residential and commercial development in planned growth centers. Land development in areas away from such centers could contribute to the degradation or loss of high-value habitat or wetlands in outlying and rural areas. Potential improvements in water quality would not be realized because stormwater would not receive water quality treatment with the No Build Alternative.

Segment A Alternatives

All Segment A alternatives would follow identical routes in the vicinity of Thornton Creek and Stream SSE1 and would, therefore, affect equal amounts of the streams' regulatory buffers (see Table 4.8-3). Based on the condition of the riparian habitat for those watercourses, the potential for adverse effects would be minimal.

The Preferred Alternative would affect 2 acres of Forest cover. The other light rail alternatives would affect similar amounts of Forest cover, ranging between 1 and 2 acres. All affected areas would be immediately adjacent to the I-5 corridor, where existing habitat has been substantially modified from pre-settlement conditions. Therefore, impacts in these areas would not be expected to result in substantial adverse effects on vegetation or wildlife resources in the study area.

All light rail alternatives in Segment A have the potential to affect a total of approximately 0.9 acre of wetland area, distributed among seven wetlands. The regulatory buffers of all these wetlands would also be affected, along with the buffers of four additional wetlands. The total area of wetland buffer impacts under the Preferred Alternative and Alternatives A1, A3, A10, and A11 would be 0.3 acre. Alternatives A5 and A7 would additionally affect the buffer of an additional wetland, with a total wetland buffer impact area of 0.8 acre (Table 4.8-3). Most affected wetland and buffer areas are within the WSDOT right-of-way; they are degraded, vegetated by invasive species, and disconnected from other wetlands by roadways and development.

Segment B Alternatives

Elevated portions of the guideway of the Preferred Alternative would cross a piped portion of the main stem of McAleer Creek immediately east of I-5, passing through the regulatory buffers of surface-flowing segments of that stream at the I-5/SR 104 interchange, and would affect approximately 0.5 acre of regulatory buffer. Alternatives B1 and B2A would cross the main stem of McAleer Creek at the same location as the Preferred Alternative, immediately east of I-5, and would affect approximately equal amounts of the regulatory buffer for that stream and its three tributaries in the study area (Table 4.8-3). Alternative B4 would cross an open segment of McAleer Creek where it exits the culvert under I-5 and would affect more of the stream's buffer than the other alternatives.

The Preferred Alternative and Alternatives B1 and B2A would cross over a segment of Stream SMT1 south of the Mountlake Terrace Transit Center, affecting approximately 0.5 acre of that stream's regulatory buffer. At the elevated crossing of any of these alternatives, it is possible that a portion of one guideway support column could be placed below the ordinary high water mark of that watercourse.

Alternative B4 would not affect Stream SMT1 or any of its buffer areas because the route would enter the I-5 median south of the existing Mountlake Terrace Transit Center. All of the Segment B alternatives, including the Preferred Alternative, would affect less than 0.1 acre of each regulatory buffer for Streams SSH2 and SSH4. The design for the 220th Street Station South Option would not change these impacts on stream buffers.

The Preferred Alternative and Alternative B2A would affect approximately 11 acres of Forest cover, including some in a location that WDFW has identified as a priority habitat area. Alternative B1 would cross the same priority habitat area but would affect a smaller amount of Forest cover overall (5 acres). Alternative B4 would affect only 3 acres of Forest cover because it would enter the I-5 median south of the Mountlake Terrace Freeway Station and avoid the forested habitat to the north. The potential adverse effects of alignments in forested areas under any of these alternatives would include habitat loss and an increased risk of introducing or spreading invasive species. As noted in the general discussion of long-term impacts above, the risk of disturbance to wildlife due to increased human access, noise, and light would be low because the affected areas currently have high noise levels. The design options for the 220th Street SW Station would not affect impacts on Forest cover.

The Preferred Alternative would have the potential to affect 0.8 acre of wetland area, distributed among four wetlands. Implementation of the 220th Street Station South Option under the Preferred Alternative would eliminate the need for reconstructing the off-ramp from I-5 southbound at 220th Street SW, thereby avoiding one wetland and reducing the total wetland impacts to 0.5 acre (Table 4.8-3). The Preferred Alternative (with or without the 220th Street Station South Option) would affect 1.6 acre of wetland buffers. Of all the Segment B alternatives, Alternative B1 would affect wetlands the least, followed by Alternative B4, because both are largely in the freeway median. Alternative B2A would have the most wetland and buffer impacts. The impacts of the Preferred Alternative would be intermediate (Table 4.8-3). Alternative B1 would directly affect one wetland, and Alternatives B2A and B4 would each affect four wetlands.

Under all the alternatives, most impacts would occur along the edges of wetlands and buffers, except for the Preferred Alternative and Alternative B2A, either of which would cross over much of the second-largest wetland in the study area (Wetland WMT6). All of the wetlands that would be affected by the Segment B alternatives

have relatively low quality ratings, based on habitat degradation, the presence of invasive species, and lack of connectivity with wetlands.

Reconstructing the southbound I-5 off-ramp and parking garage near the 220th Street SW Station under Alternative B2A could have impacts on Wetland WMT6 that would exceed 0.5 acre; if this alternative was selected for implementation, permitting requirements under the Clean Water Act would likely require consideration of reasonable avoidance measures to reduce the impacts to less than 0.5 acre.

Segment C Alternatives

Under all of the Segment C alternatives, habitats in Scriber Creek and the associated wetland complex would be spanned by elevated guideways, minimizing the potential for direct adverse effects. The amount of Scriber Creek's regulatory buffer affected by the Preferred Alternative would be approximately 0.5 acre (Table 4.8-3). Among the other light rail alternatives, Alternatives C1 and C3 would have the least impact (ranging from 0.1 to 0.2 acre) because with either their median (Option 1) or west options (Option 2), they would cross small portions along the northern or southern edges of the wetland complex. Alternative C2 (both Options 1 and 2) would have the greatest impact, crossing through the middle of the wetland complex and affecting approximately 0.9 acre of Scriber Creek's regulatory buffer. Impacts to the Scriber Creek wetland complex could adversely affect coho salmon and cutthroat trout that rear and overwinter in wetland habitats adjacent to Scriber Creek.

Under any of the Segment C alternatives, the extent of adverse impacts after final design and at the point of permitting would likely be smaller than is suggested by these acreage estimates. The guideway would be more than 15 feet above the ground surface in this area, and shading and other impacts on vegetation would likely be minimal. Direct impacts would be limited to the areas occupied by support columns for the guideway. Under any of the Segment C alternatives with median and west side options, the amount of stream or stream buffer affected under Option 1 and Option 2 would be the same.

Although all of the Segment C alternatives and options, including the Preferred Alternative, would cross the Scriber Creek wetland complex at different locations, their impacts on Forest and Shrub cover would be similar (Table 4.8-3). The Preferred Alternative and Option 2 of Alternative C3 would affect more Forest cover (2 acres) than the other alternatives and options. Most of the affected area would consist of a strip of Forest along I-5 east of 52nd Avenue West. The current habitat value of this strip is limited by its narrow, linear shape and its location between I-5 and adjacent commercial development.

The Scriber Creek wetland complex and associated buffers would be affected by all the Segment C alternatives (Table 4.8-3). The Preferred Alternative would have the

potential to affect 0.7 acre of wetland area and 1.0 acre of wetland buffer overall; most of the affected area would be associated with smaller wetlands near I-5. Among the light rail alternatives, Alternative C1 would affect the Scriber Creek wetland complex less, crossing a small portion along the northern edge of the wetland complex. Alternative C2 (both Options 1 and 2) would affect it more, crossing through the middle of the wetland complex. Alternative C3 would cross a small portion along the southern edge of the wetland complex, affecting only slightly more area than Alternative C1. Alternative C3 would also affect a nearby wetland. For each of the Segment C alternatives with median and west side options, Option 2 (west of I-5) would have a greater impact on wetlands than Option 1 because Option 2 would affect a small (less than 0.1 acre) portion of a wetland near I-5.

Under any of the light rail alternatives, long-term ground alteration of any wetlands in Segment C would be less than reported in Table 4.8-3 because the alignment would be elevated through all areas where wetlands are present. The elevated guideway would span the smaller wetlands; in the Scriber Creek wetland complex, columns would be constructed in the wetland.

4.8.3 Construction Impacts

Construction impacts would be limited to the period during and immediately following project construction. The construction period would last 6 years (from beginning of construction to beginning of operation). At most locations, ground-disturbing activities would last a year or two. Temporarily disturbed sites would be replanted immediately following construction in each project segment, and vegetation would likely become reestablished within a year or two at most sites.

The conceptual level of design for the footprints of the light rail alternatives include some assumptions and buffers for construction activities and staging areas (some of which are assumed to be located within the project's footprint and are therefore identified as permanent impacts). Although detailed construction limits are not defined at this early phase in the project design, potential construction limits have been estimated near streams, stream buffers, wetlands, and wetland buffers. These consist of areas where temporary impacts could extend beyond the 10- to 12-foot buffer generally defined for the analysis of long-term impacts to account for additional areas that would be needed to construct the project. Additional staging areas could be identified later by the contractor, if needed. In Segment A, the alignment and associated features would be situated on or adjacent to currently developed areas. For this reason, it was assumed for this analysis that no additional construction areas would be required in wetlands, streams, or buffers outside of the analytical buffer that was used to estimate long-term impacts.

For aquatic species and habitat, earthwork and equipment associated with project construction could introduce sediment and contaminants (e.g., fuel or hydraulic

fluids) to streams downstream of the project. Within each project segment, aquatic resources would be at risk during construction based on the total amount of ground-disturbing activity within each basin. Construction work within stream buffers, including work on elevated guideways that pass over streams, would have the highest risk of delivering sediment and pollutants to those streams. The use of artificial lighting for nighttime construction could affect fish because changes in nighttime light conditions may alter migratory behavior or affect predation rates on juvenile salmonids.

Estimated construction impacts on stream buffers are summarized in Table 4.8-4. Under all light rail alternatives, the potential for adverse effects on aquatic species and habitat would be minimized by ensuring that work conditions and activities comply with the required project permits, and by implementing BMPs designed to avoid or minimize the delivery of construction-related sediment and contaminants to streams (see Section 4.8.6, Potential Mitigation Measures).

Table 4.8-4. Summary of Potential Construction Impacts on Aquatic Resources and Wetlands by Segment Alternative

Segment/Alternative	Aquatic Resources[a] (acres)	Wetlands/Wetland Buffers (acres)	Wetlands Affected
Segment A: Seattle to Shoreline			
All alternatives, including the Preferred Alternative	0.0	0.0	NA[b]
Segment B: Shoreline to Mountlake Terrace			
Preferred Alternative	McAleer Creek (0.4) SMT1 (0.2)	0.1 / 0.4	WSH5, WMT1, WMT2, WMT3, WMT6, WMT7, WMT10, WMT11, PWLY3
Preferred Alternative with 220th Street Station South Option	McAleer Creek (0.4) SMT1 (0.2)	0.1 / 0.4	WSH5, WMT1, WMT2, WMT3, WMT5, WMT6, WMT7, WMT10, WMT11, PWLY3
Alternative B1	McAleer Creek (0.4) SMT1 (0.2)	0.0 / 0.1	WMT3, WMT10
Alternative B2A	McAleer Creek (0.4) SMT1 (0.2)	0.0 / 0.1	WMT3, WMT10,
Alternative B4	0.0	0.0 / 0.1	WMT10

Table 4.8-4. Summary of Potential Construction Impacts on Aquatic Resources and Wetlands by Segment Alternative

Segment/Alternative	Aquatic Resources[a] (acres)	Wetlands/Wetland Buffers (acres)	Wetlands Affected
Segment C: Mountlake Terrace to Lynnwood			
Preferred Alternative	Scriber Creek (N/A)	0.3 / 0.2	WLY3, WLY4, WLY7
Alternative C1 (with Option 1)	Scriber Creek (0.1)	0.0 / <0.1	WLY4
Alternative C1 (with Option 2)	Scriber Creek (0.1)	0.0 / <0.1	WLY4
Alternative C2 (with Option 1)	Scriber Creek (N/A) SLY1 (<0.1)	0.0 / 0.2	WLY4
Alternative C2 (with Option 2)	Scriber Creek (N/A) SLY1 (<0.1)	<0.1 / 0.3	WLY3, WLY4
Alternative C3 (with Option 1)	Scriber Creek (N/A) SLY1 (<0.1)	0.0 / <0.1	WLY4
Alternative C3 (with Option 2)	Scriber Creek (N/A) SLY1 (<0.1)	<0.1 / 0.1	WLY3, WLY4

[a] The potential for construction-related effects on aquatic resources is indicated by the estimated construction area within each local jurisdiction's regulatory buffer area for specified streams. The *Ecosystem Resources Technical Report* provides additional detail (see Appendix D of the technical report).

[b] Because the proposed alignment in Segment A would be located within or adjacent to currently developed areas, it is anticipated that any of the light rail alternatives could be constructed without disturbing areas outside the analytical buffer that was used to estimate long-term impacts.

To minimize the potential for impacts on ecosystem resources in Scriber Creek and the associated wetland complex for the Preferred Alternative (as well as Alternatives C2 and C3), temporary work trestles would be used for equipment access during construction of the elevated guideway across the Scriber Creek wetland complex. The trestles would be supported by steel piles and would remain in position only as long as needed for the completion of project construction. Any in-water work for trestle construction (including pile driving and pile removal) would be conducted in accordance with the terms of the Hydraulic Project Approval (HPA) and other applicable permits obtained for the project. Such permits typically place restrictions on the time of year when work can be conducted below the ordinary high water mark of any streams. These permits also typically include numerous provisions aimed at avoiding or minimizing the potential for adverse effects on fish and aquatic habitat (discussed in Section 4.8.6, Potential Mitigation Measures).

For vegetation and wildlife, Sound Transit assumes that the temporary construction impacts on habitat for each alternative would be proportionate to the amount estimated for long-term impacts. In other words, alternatives with greater amounts of long-term impacts would likewise be expected to have greater amounts of temporary impacts. Vegetation and wildlife habitat would be temporarily affected by clearing for the project's permanent facilities as well as for access roads and equipment storage areas. Wildlife species near the project corridor could be affected by noise, vibration, dust, dirt, light, and the clearing and grubbing of the landscape along the alignment. As with the long-term impacts described in Section 4.8.2, there would be a low risk of disturbance to wildlife from human access, noise, and light during construction

because the affected areas currently have high noise levels and low habitat value. Construction activities involving the removal of vegetation or structures that support bird nests (e.g., bridges, overpasses) during the breeding season could destroy nests, eggs, or birds protected under the Migratory Bird Treaty Act.

Wetlands could incur temporary loss, or wetlands and buffers could be degraded by construction-related activities, such as vegetation clearing and temporary site grading and filling for site access. Estimated construction impacts on wetlands and wetland buffers are summarized in Table 4.8-4.

Temporary construction impacts to wetlands and their functions would be minimized by the installation, monitoring, and maintenance of appropriate BMPs for the duration of construction. Wetland functions could be affected by soil compaction, accidental spills of hazardous substances, noise and human-caused disturbance, potential increase of sediment input, and introduction of invasive species.

4.8.4 Indirect Impacts

Under any of the light rail alternatives, several factors would limit the potential for development near stations to adversely affect ecosystem resources. All proposed stations would be located in areas that are already densely developed. Any new development in these areas would be subject to review under local critical areas ordinances. This review would trigger the implementation of mitigation measures and practices aimed at avoiding or minimizing the potential for adverse effects on wetlands, aquatic species and habitat, and other natural resources such as fish and wildlife habitat conservation areas.

Indirect impacts also include potential interference with possible future habitat restoration projects. For example, the presence of guideways, stations, or other facilities near streams could affect the potential replacement of existing fish passage barriers by limiting options for locations and types of fish-passable crossing structures. In most locations, the potential for construction of the light rail alternatives to interfere with possible future fish habitat restoration projects would be minimal because project features would be designed and located to avoid streams. As noted in Section 4.8.2, Long-Term Impacts, no new culverts would be added in streams with documented or potential fish habitat and no existing culverts in such streams would be extended. Moreover, construction and operation of any of the light rail alternatives would not interfere with any anticipated culvert replacement projects.

One stream in the study area (SMT1) that is currently categorized as non-fish-bearing is upstream of a culvert identified as a fish passage barrier in the I-5 right-of-way. The reach of SMT1 crossed by the light rail alternatives is approximately 2,000 feet upstream of the barrier culvert. The alternatives that cross SMT1 (the Preferred Alternative and Alternatives B1 and B2A) would be elevated at this location. If the barrier culvert is removed and fish access to SMT1 is restored in the future, and if

fish habitat improvement projects are subsequently planned for the stream reach crossed by the elevated guideway, it is possible that a guideway support column at this location could complicate the design of such habitat restoration projects. Such interference is unlikely to occur, however, because the stream channel at this location is poorly defined and the local topography offers ample opportunities for the creation of a channel that would avoid support columns or other structures.

4.8.5 Cumulative Impacts

Past actions and development have greatly changed the landscape in the study area and surrounding vicinity. Present and reasonably foreseeable future actions, including other transportation or infrastructure projects and other planned or pending land use actions or developments in the project vicinity, could contribute to cumulative impacts on ecosystem resources in the study area. Not all reasonably foreseeable actions have the potential to result in adverse effects on the environment. For example, WSDOT and WDFW formed a cooperative program in 1991 to inventory and assess fish passage barriers on WSDOT facilities statewide. Culvert replacement and retrofitting projects through that program may improve fish access to streams in the study area. Sound Transit would coordinate its light rail facility design with WSDOT to avoid conflicts with these projects.

Several proposed site development projects could have some effect on ecosystem resources in the study area. These include a site in Mountlake Terrace, south of 236th Street SW and the Mountlake Terrace Transit Center, which is envisioned by the City of Mountlake Terrace to accommodate higher-density development. The Edmonds School District master plan includes developing a bus base and administration center north of I-5 and east of 52nd Avenue West in Lynnwood. Construction of this facility could affect ecosystem resources such as the Scriber Creek wetland complex. Sound Transit is considering an OMSF alternative in the same area, although the Preferred Alternative is a Bellevue site. The Lynnwood site alternative would largely be built on previously developed parcels but a portion would extend into the Scriber Creek wetland complex, with about 2 acres of potential direct impacts to wetlands and slightly under 2 acres of wetland buffer impacts. The impacts of one or potentially both of these projects in Lynnwood could be lessened through final design, but their combined impacts would result in loss or degradation of vegetation, wildlife habitat, streams, wetlands, and associated buffer areas in the complex. These impacts would be both short-term (e.g., temporary disturbance during construction) and long term (e.g., conversion of vegetated areas to impervious surface).

These projects and future projects generally would have limited potential for adversely affecting aquatic species, aquatic habitat, vegetation, wildlife, or wetlands in the study area. Any projects or land use actions would be subject to regulatory

review and/or permitting under federal, state, and local regulations. These review and permitting processes would trigger the implementation of measures to avoid or minimize impacts on ecosystem resources. Such processes would also provide compensatory mitigation for any unavoidable impacts on streams, stream buffers, wetlands, or wetland buffers. If combined with the effects of the Lynnwood Link Extension, there would be higher cumulative effects on ecosystem resources than if the impacts of each project were considered on its own. However, if avoidance and mitigation measures such as those described below are applied for all projects, the effects would be minimal. Coordination among the project proponents could also help to reduce impacts.

4.8.6 Potential Mitigation Measures

Sound Transit's policy on ecosystem mitigation is to avoid impacts on environmentally sensitive resources as much as possible, and to provide adequate mitigation for unavoidable impacts to ensure no net loss of ecosystem function and acreage as a result of agency projects. Mitigation for ecosystem impacts is based on a hierarchy of avoiding, minimizing, and compensating for unavoidable adverse impacts. The design of the Lynnwood Link Extension already incorporates avoidance and minimization techniques, although further avoidance and minimization measures would continue to be pursued as the project enters final design and permitting stages.

Under any of the light rail alternatives, Sound Transit would comply with standard BMPs and applicable federal, state, and local mitigation requirements during design, construction, and post-construction activities. A summary of BMPs that would be applied to avoid and minimize impacts on ecosystem resources follows. Additional details are provided in the *Ecosystem Resources Technical Report*.

Construction Best Management Practices

Sound Transit's construction contractor would implement construction BMPs that would apply to all work in or around sensitive areas. The construction contractor would work within construction limits marked with fencing and signage to prevent unintended impacts on riparian vegetation, wetlands, woodlands, and other sensitive sites outside of the construction limits.

The construction contractor would be required to develop, implement, and monitor a temporary erosion and sediment control (TESC) plan to address potential erosion for the duration of construction. Temporary work trestles or other measures that minimize impacts would be used in extremely sensitive areas, such as the Scriber Creek wetland complex.

BMPs would be employed for fish and aquatic habitat protection. All work below the ordinary high water mark would comply with the terms and conditions set forth in the

HPA issued by WDFW for the project. Seasonal restrictions (i.e., work windows) would apply to work conducted below the ordinary high water mark. To reduce the risk of adverse effects on migrating salmonids, Sound Transit would require construction contractors to direct lighting away from fish-bearing waters and to place hoods or shields on lights, as needed, to minimize the amount of backlight or dispersed light cast toward the water's surface. Any affected streambeds and stream banks would be restored and replanted with native vegetation after in-water work.

For water quality protection, the project would obtain and adhere to a construction stormwater general permit under the National Pollutant Discharge Elimination System (NPDES) permit program to reduce or eliminate stormwater pollution and other impacts on surface waters. A construction stormwater pollution prevention plan (SWPPP), approved by Ecology, would also be implemented before the start of construction. The plan would include BMPs to (1) prevent erosion; (2) prevent sedimentation; and (3) identify, reduce, eliminate, or prevent stormwater contamination and water pollution from construction activity. The requirements of the plan and the BMPs to be employed are described in Section 4.9.3 (Construction Impacts – Water Resources).

Measures would be implemented before and during project construction to avoid or minimize effects on vegetation and wildlife resources. Examples of these measures are minimizing vegetation clearing, restoring temporarily affected areas, preparing and implementing a revegetation plan, and implementing construction methods to avoid impacts on migratory birds. In accordance with the Migratory Bird Treaty Act, Sound Transit would consult with the U.S. Fish and Wildlife Service on measures to avoid impacts on migratory birds. Measures likely to be required may include pre-construction surveys for migratory birds and/or restrictions on vegetation clearing during the breeding season for migratory birds. Sound Transit would also implement appropriate measures to minimize the risk of introduction and spread of noxious and invasive species, including restoring temporarily disturbed areas as soon as practical following construction in each project segment. To minimize use of herbicides and fertilizers, restoration of disturbed areas would include the use of mulching, ground cover, and other planting strategies that discourage growth of undesirable species.

Design and Operation Best Management Practices

Sound Transit would also implement design and operation BMPs for permanent stormwater runoff treatment and flow control. These would include natural or engineered dispersion BMPs; biofiltration BMPs such as vegetated filter strips, biofiltration swales, or ecology embankments; wet-pool BMPs; and infiltration BMPs. The project would route drainage to maintain existing stream basin contributing areas. In addition, Sound Transit would coordinate with WSDOT, local

jurisdictions, and resource agencies conducting restoration projects in the area to minimize the potential for light rail facilities to interfere with future restoration projects. Except where hazard trees pose an immediate threat to light rail safety or reliability, vegetation maintenance and hazard tree removal would be conducted outside of the breeding season for migratory birds.

Compensatory Mitigation

To the extent that impacts cannot be avoided or adequately minimized through BMPs, Sound Transit would implement additional measures to reduce adverse effects, as well as provide compensatory mitigation measures where adverse effects are unavoidable. Sound Transit has committed to achieving no net loss of ecosystem function and acreage on a project-wide basis. This includes a commitment to no net loss of wetland functions and wetland areas. Long-term impacts on wetlands and wetland buffers would be mitigated through the use of available approved mitigation banks, the King County in-lieu fee program, or project-specific mitigation developed by Sound Transit. Sound Transit would implement compensatory mitigation in accordance with applicable federal, state, and local requirements and guidelines.

Mitigation for unavoidable impacts on streams, stream buffers, and wildlife habitat would comply with local critical areas ordinances. In general, those ordinances state that mitigation should prevent the net loss of ecological function; the means of achieving that goal are determined through individual permitting processes. Sound Transit's actions to mitigate for impacts on wetlands and wetland buffers (e.g., planting native trees and shrubs near wetland areas) would help offset the loss of some habitat for wildlife and contribute to improved ecological function of nearby streams and stream buffers. Tree planting required for compliance with WSDOT's and local jurisdictions' tree protection rules would also help mitigate impacts on streams, stream buffers, and wildlife habitat. Lastly, planting of trees and shrubs to mitigate for visual impacts (including in replacement lands for affected WSDOT beautification areas along I-5, as described in Section 4.5, Visual and Aesthetic Resources) would also provide ecological benefits.

Potential sites currently under consideration for project-specific mitigation for impacts on wetlands and wetland buffers are described below.

North Seattle Community College Campus

Various opportunities may be present on the North Seattle Community College Campus for wetland restoration and enhancement, although other projects proposed in the vicinity may reduce the area available.

Jackson Park Golf Course/5th Avenue NE

Potential wetland and riparian mitigation could be constructed along the east side of the 5th Avenue NE right-of-way and the Jackson Park Golf Course, particularly along North Branch Thornton Creek.

NE 145th Street Vicinity

Two potentially available parcels near Paramount Park in Shoreline may provide opportunities for wetland protection and restoration.

NE 155th Street Station Vicinity

Wetland creation may be possible south of the NE 155th Street Station (proposed under Alternatives A5 and A7) near the locations of Wetlands PWSH4 and PWSH5.

Ballinger Lake Golf Course

The City of Mountlake Terrace will be transitioning the Ballinger Lake Golf Course to a passive park/open space, which could create wetland restoration opportunities.

Scriber Creek Wetland Complex (Wetland WLY4)

Wetland and stream mitigation opportunities are present in the Scriber Creek vicinity near the Lynnwood Transit Center. These parcels are under both public and private ownership, including parcels that could be acquired by Sound Transit because they intersect with areas needed for the light rail right-of-way. A private parcel on Cedar Valley Road, along the western edge of the wetland complex, could also provide an opportunity for mitigation. These mitigation opportunities may include wetland creation, restoration, or enhancement.

4.9 Water Resources

This section discusses how the project would potentially affect water resources. The discussion covers surface water quality, stormwater runoff volumes, drainage systems, shorelines, floodplains, and construction stormwater management.

4.9.1 Affected Environment

The study area for the water resources analysis comprises the stream basins that would be crossed by the project, as shown on Figure 4.9-1.

Natural Water Bodies

The surface water in the study area discharges to one of three urban stream basins: Thornton Creek, Lake Ballinger/McAleer Creek, and Swamp Creek–all of which are located in Water Resource Inventory Area (WRIA) 8 (Lake Washington/Cedar/ Sammamish Watershed). In general, the lakes and streams in the study area have been affected by the surrounding urban environment, and all of the streams have

reaches that are channelized or have been piped. The following subsections describe each water body and also identify those listed in Ecology's Water Quality Assessment (the Clean Water Act Section 303(d) list). The 303(d) list designates waters that have beneficial uses–such as drinking, recreation, aquatic habitat, and industrial use, and those that are impaired by pollution.

Thornton Creek Basin

Most of Segment A would be located in the Thornton Creek Basin, from the southern starting point at Northgate to the northern boundary of the stream basin at approximately NE 185th Street (see Figure 4.9-1). In the study area, the Thornton Creek Basin contains the following water bodies:

- Thornton Creek: The southern part of the study area is near the Thornton Creek South Branch, also known as Maple Leaf Creek. The study area also crosses the Thornton Creek North Branch just south of NE 145th Street, and remains near the North Branch up to about North 176th Street. Thornton Creek collects stormwater from large sections of Shoreline and north Seattle, where the majority of the land is impervious. The creek has several sections in culverts and is on Ecology's 303(d) list of impaired water bodies for non-compliance with temperature, dissolved oxygen, and fecal coliform bacteria standards. However, there is strong public interest in returning the creek to a more natural state; some sections have been restored already, including segments around Northgate Mall.
- Twin Ponds: These created ponds, which together comprise about 4 acres, are located near NE 155th Street in Shoreline to the west of the project. They are not on Ecology's 303(d) list of impaired water bodies.
- Ronald Bog: Ronald Bog is a 7.7-acre pond/wetland complex near NE 175th Street in Shoreline. It is not on Ecology's 303(d) list of impaired water bodies.

Lake Ballinger/McAleer Creek Basin

In the study area, the Lake Ballinger/McAleer Creek Basin contains the following water bodies:

- McAleer Creek: This creek system begins at Hall Lake in Lynnwood, flows south through Hall Creek to Lake Ballinger by way of Edmonds and Mountlake Terrace, and becomes the McAleer Creek West Tributary through Shoreline to Lake Washington. The creek is fish-bearing and has multiple piped segments. The City of Lynnwood has documented flooding problems near Hall Creek and Lake Ballinger. Part of the creek near Lake Washington is on Ecology's 303(d) list of impaired water bodies for non-compliance with dissolved oxygen and fecal coliform bacteria standards.

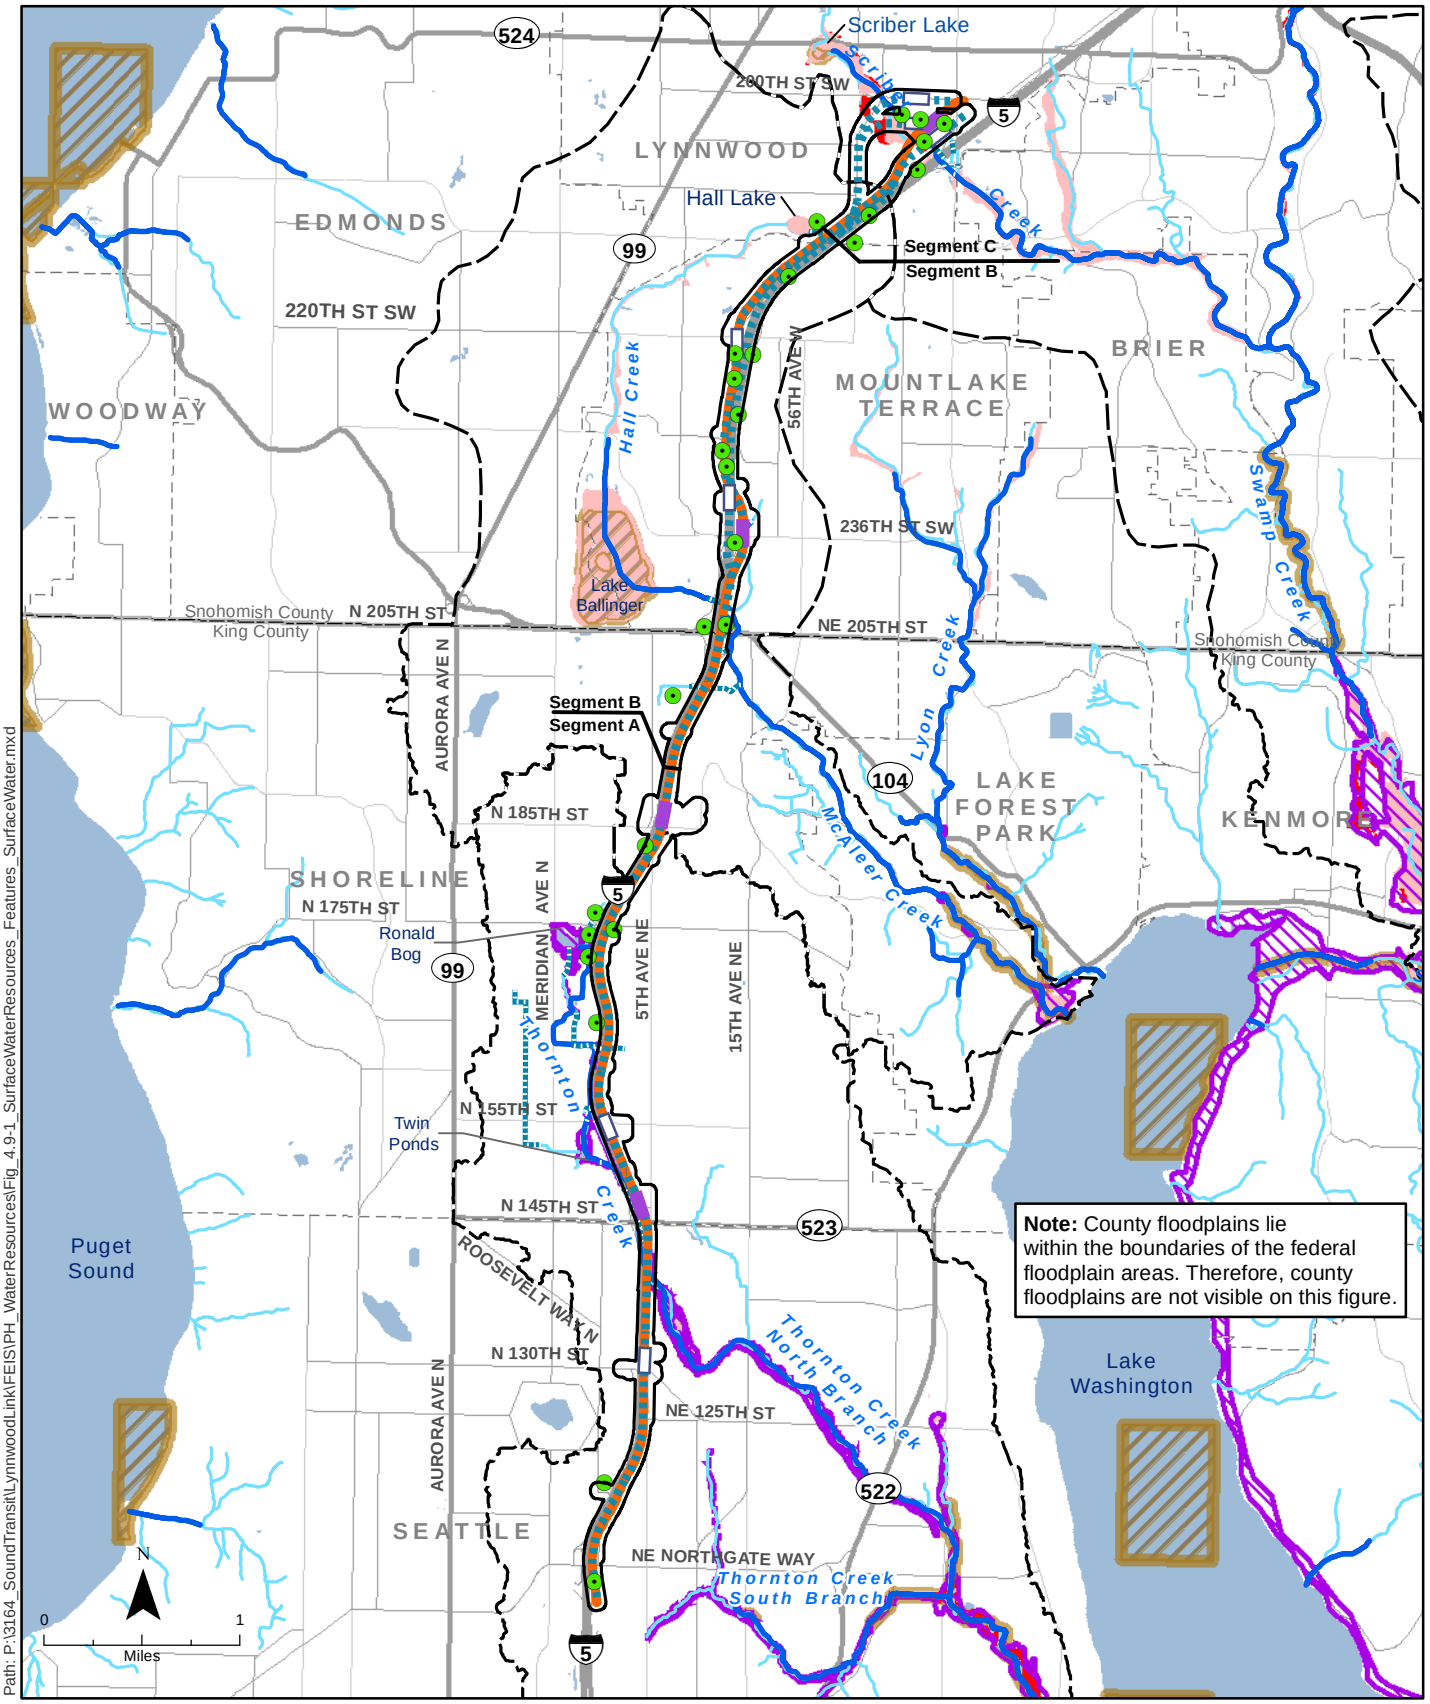

Figure 4.9-1
Water Resources
Affected Environment
Surface Water

Lynnwood Link Extension

- Lake Ballinger: Lake Ballinger is a relatively shallow 104-acre lake near the southern border of Edmonds and Mountlake Terrace. Lake Ballinger's water levels are controlled by an outlet weir, although flooding of homes surrounding Lake Ballinger is a continuing problem during large storm events. Drainage downstream in McAleer Creek is constrained by a 60-inch pipe that is too small to accommodate flows and results in continued flooding problems in the creek during large storms. While the lake is fish-bearing and supports other wildlife, it is on Ecology's 303(d) list for non-compliance with dioxin, dieldrin (a pesticide), and polychlorinated biphenyl (PCB) standards.

Swamp Creek Basin

Within the Swamp Creek Basin, only Scriber Creek is in the study area. Scriber Creek begins above Scriber Lake in Lynnwood and flows downstream to a large wetland near the Lynnwood Transit Center, goes under I-5 in a pipe, and then flows through forested wetland to Swamp Creek. Scriber Creek is not on Ecology's 303(d) list of impaired water bodies.

Stormwater Infrastructure

In the study area, most of the surface stormwater is collected by piped municipal systems. The largest system is in the I-5 right-of-way and features pipes and roadside ditches, media filter drains, stormwater ponds, and vaults. The locations of existing water quality and flow control facilities (WSDOT and municipal) in the proposed project vicinity are presented in Figure 4.9-1. A detailed list of the existing facilities is provided in Appendix I-4.9, Water Resources.

Land Use

Next to the proposed project is a mixture of urban residential, commercial, and vegetated areas. The impervious (hard) surfaces along the study area are a fairly even mix of pollution-generating roadway and parking areas, with non-pollution-generating surfaces that typically include roofs and sidewalks. Sound Transit reviewed the existing land cover within 100 feet of the proposed light rail routes to establish existing conditions and estimate potential changes in runoff flow volumes and pollutant loads with the project.

Infiltration

Figure 4.9-2 shows the hydrologic soil groups in the study area. The most common group is Type C, which is predominantly till-type soil that has a low infiltration and a high runoff potential. Type C soils are generally not compatible with stormwater management facilities that require surface water to infiltrate, which includes many low impact development (LID) approaches. Other soil groups in the study area are

Soils

Lynnwood Link Extension

Types A and B, which have high to moderate infiltration potential, respectively, and are generally compatible with many types of LID stormwater facilities. There are also areas of Type D soils, which are typically saturated areas that do not allow percolation of additional surface water. Details regarding soil types and locations within each hydrologic soil group are presented in Appendix I-4.9.

Shorelines

Ecology has delegated authority to regulate designated shorelines in the study area to the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood. Lake Ballinger is the only water body in the study area with a state-designated shoreline, but it is not a shoreline of statewide significance. Around the shoreline of Lake Ballinger and its associated wetlands, the City of Mountlake Terrace requires prior approval and permits for larger development.

Floodplains

Federal floodplains, county flood hazard areas, and city flood hazard areas within the study area are shown on Figure 4.9-1. Thornton Creek, McAleer Creek, and Scriber Creek have floodplains that extend beyond their banks in the vicinity of the proposed project. In addition to requiring the flood storage and conveyance capacity of the flood zones to be maintained, local governments in the study area generally prohibit certain types of construction and activities in their flood zones, require preservation of wetlands or other natural flood storage features, and require flood-proofing for construction. Flood zone designation details for each study area jurisdiction and applicable floodplain regulations are presented in Appendix I-4.9.

4.9.2 Long-Term Impacts

This subsection identifies potential long-term impacts from the project alternatives.

No Build Alternative

Under the No Build Alternative, light rail would not be extended to Lynnwood and the associated changes to the landscape within the study area would be avoided. As a result, there would be no direct impacts from the project.

Impacts Common to the Light Rail Alternatives

The light rail alternatives are all similar in structural components, operational activities, and general alignment locations at the stream basin level. Therefore, each light rail alternative poses similar types of potential impacts to water resources, but in some cases in varying degrees.

Through continued project design and development in compliance with stormwater management regulations, Sound Transit would prevent or minimize potential impacts

to water resources. Examples of measures to prevent or minimize impacts include minimizing impervious footprints, avoiding the placement of project elements in or near water resources where possible, and installing appropriate water quality treatment and flow control facilities. Sound Transit's *Link Design Criteria Manual* (Sound Transit 2012b) requires stormwater facilities for its projects to conform to the requirements of local jurisdictions.

Chapter 30 of Sound Transit's *Link Design Criteria Manual* emphasizes sustainability measures, including LID as a preferred stormwater management method, if appropriate and feasible. Also, the 2012 Ecology *Stormwater Management Manual for Western Washington* requires LID approaches to stormwater management to the extent feasible. Stormwater management facilities would be designed using sustainable, LID approaches where practical. Some site conditions, however, may necessitate other approaches. Additional water resource regulations applicable to the project area and potential stormwater management approaches that could be implemented by the project are discussed in Appendix I-4.9.

Surface Water

The potential impacts to surface water from the project are summarized in Tables 4.9-1 and 4.9-2 for each project segment. To evaluate these impacts, Sound Transit considered:

- Increases in impervious surfaces: Impervious surfaces increase runoff volumes that can escalate flooding and flow frequencies, which in turn can contribute to stream erosion and aquatic habitat degradation. In addition, impervious areas subject to vehicular traffic and other pollution-generating activities accumulate contaminants that are transported to water bodies by stormwater runoff. This can include parking areas, although garages would have less pollution-generating areas than surface lots.
- BMPs: The design of the alternatives already features stormwater management facilities. Other BMPs and LID strategies will be considered in addition to these water quality and flow control facilities.
- Use of at-grade versus elevated structures: At-grade areas would be slightly wider than the elevated guideway structures and result in more impervious surfaces, pose more risk of direct conflict with municipal stormwater management facilities, and require more alteration of surface grade areas and flow paths.
- Stream crossings: Sound Transit's design is elevated for all stream crossings, which minimizes impacts to stream channels; columns or other structures in and around stream buffers can still pose a risk to buffer quality.
- Use of the I-5 median: The project would require less vegetation removal if the guideway were placed in the I-5 median rather than adjacent to the highway.

Given Sound Transit's commitment to design the project to meet the stormwater management requirements of each jurisdiction and to comply with applicable permit requirements, the light rail alternatives are not expected to adversely affect surface waters.

Impervious Surfaces

The Preferred Alternative and other light rail alternatives would add both pollution-generating and non-pollution-generating impervious surfaces in the vicinity of the light rail alternatives. Pollution-generating impervious surfaces are subject to motor vehicle use and include parking areas, bus holding areas, and project-associated roads or road realignments. Non-pollution-generating impervious surfaces are not subject to motor vehicle use and include the light rail tracks, guideways, and stations. Table 4.9-2 summarizes the range of impervious surface changes that would result from the Preferred Alternative and other alternatives in Segments A, B, and C compared to existing conditions. A discussion of the impervious surface calculation is presented in Appendix I-4.9, including a table and map depicting estimated changes for individual alternatives.

Table 4.9-1. Surface Water: Comparison of Alternatives

Segment/ Alternative	Impervious Increase [a]	BMPs Featured in Design	At-Grade Portions	Stream Crossings	Additional Considerations
Segment A: Seattle to Shoreline					
Preferred Alternative	About 30 acres	Detention Ponds, Detention Vaults, Guideway Dispersion, Bioretention, and Infiltration Facilities	Highest amount of at-grade portions, NE 130th Street Station at-grade	Elevated over Thornton Creek crossing south of NE 145th Street	Smallest NE 145th Street Station footprint Options: ▪ NE 130th Street Station (would not change the amount of impervious increase) ▪ Shoreline Stadium Garage (would not change amount of impervious increase)
Alternative A1	About 30 acres	Same as Preferred Alternative	Medium amount of at-grade portions	Same as Preferred Alternative	Includes reconstruction of NE 117th Street bridge; largest NE 145th Street Station footprint
Alternative A3	About 27 acres	Same as Preferred Alternative	Lowest amount of at-grade portions	Same as Preferred Alternative	Smallest NE 145th Street Station footprint
Alternative A5	About 30 acres	Same as Preferred Alternative	Medium amount of at-grade portions, NE 130th Street Station at-grade	Same as Preferred Alternative	Includes new parking lot at NE 155th Street Station

Table 4.9-1. Surface Water: Comparison of Alternatives

Segment/ Alternative	Impervious Increase [a]	BMPs Featured in Design	At-Grade Portions	Stream Crossings	Additional Considerations
Alternative A7	About 27 acres	Same as Preferred Alternative	Lowest amount of at-grade portions	Same as Preferred Alternative	Includes new parking lots at NE 130th and NE 155th Street stations
Alternative A10	About 30 acres	Same as Preferred Alternative	Medium amount of at-grade portions, NE 130th Street Station at-grade	Same as Preferred Alternative	Includes reconstruction of NE 117th Street bridge; largest NE 145th Street Station footprint
Alternative A11	About 27 acres	Same as Preferred Alternative	Lowest amount of at-grade portions	Same as Preferred Alternative	Includes new parking lot at NE 130th Street Station; smallest NE 145th Street Station footprint
Segment B: Shoreline to Mountlake Terrace					
Preferred Alternative	About 17 acres	Infiltration Ponds, Other Infiltration Facilities, Detention Ponds, and Detention Vaults	Lowest amount of at-grade portions	Elevated over McAleer Creek crossings at NE 205th Street/SR 104 and near 237th Street SW	None of the alignment would be within existing I-5 median Option: ▪ 220th Street SW Station South with 200-car surface parking lot (amount of impervious increase with option would be similar to Alternative B2A)
Alternative B1	About 10 acres	Same as Preferred Alternative	Highest amount of at-grade portions	Same as Preferred Alternative	Makes some use of I-5 median alignment Option: ▪ Parking garage on existing surface lot with 280 additional spaces (would not change amount of impervious increase)
Alternative B2A	About 20 acres	Same as Preferred Alternative	Medium amount of at-grade portions	Same as Preferred Alternative	None of the alignment would be within existing I-5 median; includes new parking lot at 220th Street SW Station
Alternative B4	About 10 acres	Same as Preferred Alternative	Highest amount of at-grade portions	Similar to Preferred Alternative, but avoids crossing near 237th Street SW	Makes the most use of I-5 median alignment, including Mountlake Terrace Freeway Station

Table 4.9-1. Surface Water: Comparison of Alternatives

Segment/ Alternative	Impervious Increase [a]	BMPs Featured in Design	At-Grade Portions	Stream Crossings	Additional Considerations
Segment C: Mountlake Terrace to Lynnwood					
Preferred Alternative	About 4 acres	Detention Vault and Guideway Dispersion	All elevated	Moderate crossing footprint over Scriber Creek and associated buffers	Lynnwood Transit Center Station would not add any new impervious surface and would potentially remove existing impervious surface
Alternative C1	About 4 acres	If connected to a west side alignment: Same as Preferred Alternative If connected to a median alignment: Infiltration Trenches, Detention Vaults, and Guideway Dispersion	All elevated	Smallest crossing footprint over Scriber Creek and associated buffers	200th Street SW Station would be located on mostly existing impervious surface; Alignment Option 2 would add more new impervious surface than Alignment Option 1[b]
Alternative C2	About 4 acres	Same as Alternative C1	All elevated	Largest crossing footprint over Scriber Creek and associated buffers	Lynnwood Transit Center Station would be located on mostly existing impervious surface; Alignment Option 2[b] would add more new impervious surface than Alignment Option 1
Alternative C3	About 4 acres	Same as Alternative C1	All elevated	Moderate crossing footprint over Scriber Creek and associated buffers	Lynnwood Park-and-Ride Station would potentially remove existing impervious surface; Alignment Option 2 would add more new impervious surface than Alignment Option 1 Station Options: 1. Existing transit center remains 2. Existing transit center relocated (would add more pollution-generating impervious surface than Station Option 1)

[a] Calculation of impervious area increase included the areas of the alternatives only and did not include options. Detailed calculations are provided in Appendix I-4.9.

[b] Alignment Option 1 refers to the alignment from the I-5 media; Alignment Option 2 refers to the alignment from the west side of I-5.

Table 4.9-2. Estimated Changes in Impervious Surfaces

Project Segment	Total Existing Impervious (acres)			Total Impervious After Project (acres)		
	PGIS[a]	NPGIS[b]	Total	PGIS[a]	NPGIS[b]	Total
Segment A Alternatives	79	11	90	79 to 83	38	117 to 121
Preferred Alternative	79	11	90	83	38	121
Segment B Alternatives	64	5	69	60 to 64	20 to 24	80 to 87
Preferred Alternative	64	5	69	64	23	86
Segment C Alternatives	56	11	67	53 to 54	16 to 17	69 to 71
Preferred Alternative	56	11	67	54	17	71

[a] PGIS (pollution-generating impervious surface) includes parking, bus areas, and roads.

[b] NPGIS (non-pollution-generating impervious surface) includes light rail tracks, guideways, and stations.

Total pollution-generating impervious surface area would be similar to existing conditions because most of the proposed road segments and parking lots would be located in areas with similar existing uses. Runoff from some areas of existing pollution-generating impervious surfaces currently receive water quality treatment while some do not. All of the light rail alternatives would include treatment of runoff from pollution-generating impervious surfaces, as summarized in Table 4.9-1. Non-pollution-generating impervious surfaces would increase compared to existing conditions, mostly as a result of the new guideway covering existing grassy right-of-way areas as shown in Table 4.9-2. The increase would not affect groundwater recharge; groundwater is discussed in Section 4.11, Geology and Soils.

Shorelines

The proposed project design would not alter any areas within regulated shorelines; therefore, no impacts are expected.

Floodplains

The Preferred Alternative and all other light rail alternatives would use elevated guideways to cross water bodies, and columns would be located outside the stream channel floodway or floodplain when it is possible to span these areas. At the Thornton Creek and McAleer Creek crossings, the preliminary engineering for the Preferred Alternative guideway spans the narrow floodplains and floodways without columns being placed within their boundaries; therefore, minor impacts or no impacts are expected. Similar designs would be anticipated for the other alternatives to minimize impacts.

In Segment C, the Scriber Creek floodplain is so wide that the project would likely have to place elevated guideway columns within the floodplain boundaries. Also, the guideway segments in this area would be wider to accommodate the station at the Lynnwood Transit Center and would be supported by pairs of columns rather than a single column in the center. The floodplain width to be crossed by the Preferred Alternative is approximately 380 feet, which would likely place 3 or 4 pairs of columns within the floodplain. Alternative C1 would cross the least amount of floodplain; this

alternative would cross two separate branches of the Scriber Creek floodplain that are 125 feet wide and 60 feet wide, respectively, and would probably place at least one pair of columns within the 125-foot-wide floodplain segment. Alternative C2 would cross the floodplain almost at its widest location of approximately 925 feet, requiring placement of 7 to 9 pairs of columns within the floodplain. Similar to the Preferred Alternative, Alternative C3 would cross a moderate width of approximately 350 feet of floodplain, which would place 2 or 3 pairs of columns within the floodplain. Placement of columns within the Scriber Creek floodplain would require a Development Permit from the City of Lynnwood, and the project would need to create additional flood storage to fully compensate for storage removed. No adverse impacts are expected.

4.9.3 Construction Impacts

The light rail alternatives would have similar potential construction-related impacts to water resources because construction equipment and techniques would be similar. Construction of alternatives with more at-grade portions (see Table 4.9-1) would have more disturbed ground area, with more areas requiring BMPs to protect sensitive areas. The activities that could affect water resources include:

- Earthwork, trench work, stockpiling, and material transport: Soil exposed in sloped excavations, fills, or trench work is especially susceptible to local erosion until vegetation is established or the surface is stabilized with pavement. If exposed soil becomes dry, it can be eroded by wind. Loose soil can be carried by water or wind off site to stormwater drains or streams where it increases turbidity in the water. Construction vehicle tires can carry soil onto roadways, where the soil could be carried into ditches or streams during storms.
- Concrete work and paving: The pH in surface water can increase to levels harmful to fish and wildlife if runoff comes in contact with process water or slurry from concrete work or curing concrete.
- Stream Crossings: Over-water work and construction in stream buffers can degrade water quality through pollutant spills, sediment transport, or wind deposition of stockpiled materials.
- Construction machinery: Equipment leaks or spills can affect water quality in nearby water resources. Hydrocarbons and other hazardous materials associated with construction machinery can increase turbidity or affect other water quality parameters, such as pH levels or the amount of available oxygen in the water.

Regulatory agencies responsible for water quality typically require construction projects to implement various BMPs, depending on site-specific and project-specific circumstances. Common measures are listed below. Sound Transit would implement the BMPs required by its permits or as necessary to meet regulatory requirements.

These permits and regulatory procedures include the NPDES Construction Stormwater General Permit process, the WDFW Hydraulic Project Approval, applicable elements of the ESA consultation, and applicable guidance manuals. Sound Transit would develop and implement a construction SWPPP to serve as the overall construction stormwater mitigation plan. This plan would be submitted to Ecology and required to be implemented for the duration of construction as part of the NPDES Construction Stormwater General Permit compliance. The construction SWPPP would include the following elements (see further details in Appendix I-4.9):

- Temporary Erosion and Sediment Control
- Spill Prevention, Control, and Countermeasures
- Concrete Containment and Disposal
- Dewatering Management
- Fugitive Dust Control

The BMPs commonly applied in the permits and regulations that apply to the project include:

- Phasing the work to minimize the amount of disturbed area at any one time
- Minimizing the need for haul roads that use fill material in sensitive areas (e.g., stream crossings or wetlands) by instead building temporary bridges or platforms with small piles (i.e., pin piles)
- Marking and fencing of construction limits
- Minimizing the amount of cleared area at a construction site
- Stabilizing construction entrances and haul roads using quarry spalls (crushed basalt)
- Washing truck tires at construction entrances
- Constructing silt fences downslope from exposed soil
- Protecting catch basins from sediment
- Containing and controlling concrete and hazardous materials on site
- Installing temporary ditches to route runoff around or through construction sites, with periodic straw bales or rock check dams to slow and settle runoff
- Providing temporary plastic or mulch to cover soil stockpiles and exposed soil
- Using straw wattles to reduce the length of unbroken slopes and minimize runoff concentration
- Using temporary erosion control blankets or mulch on exposed steep slopes to minimize erosion before vegetation is established
- Constructing temporary sedimentation ponds to remove solids from concentrated runoff and dewatering before being discharged

- Conducting vehicle fueling and maintenance activities no closer than 100 feet from waters of the state
- Implementing stream protection measures, as necessary, including diverting stream flow around the construction area and limiting the construction period to the required "work window," a period of the year identified in the HPA when fish would be minimally affected

Through compliance with applicable construction permits and the BMPs the permits would incorporate, none of the light rail alternatives is likely to adversely affect water resources during construction.

4.9.4 Indirect Impacts

Population in Washington is expected to increase in the future, with increased vehicular traffic and likely development pressure on many parts of the state. The proposed project could be expected to shift some future vehicular traffic to light rail and reduce vehicle-related stormwater pollutants. The project could also attract development in the urban areas designated for higher growth, which could protect undeveloped areas in other portions of the watershed from development. Therefore, the proposed project could indirectly offset some adverse impacts on water resources caused by population increases. The project would also support increased redevelopment in station areas, where allowed by local plans. While most of these areas are already urbanized, redevelopments would comply with current standards for water quality protection, which would be beneficial.

4.9.5 Cumulative Impacts

Historically, development in the Puget Sound watershed led to discharges of municipal sewage, stormwater runoff, and industrial wastes into local area surface waters. Logging and land clearing resulted in sedimentation in streams, lakes, and marine water bodies. Pesticides and fertilizers used on landscaped areas and contaminated runoff from impervious surfaces made their way into surface water via stormwater runoff. These past and ongoing actions have degraded water quality in many of the water bodies in the study area. Current regulations primarily target point discharge sources; however, new development or redevelopment is required to bring many existing non-point-source pollution-generating surfaces up to current standards for flow control and water quality treatment in more populated areas of the Puget Sound watershed. Therefore, small improvements in water quality are expected to occur over time, with or without the light rail project.

If other projects were constructed within the vicinity of the proposed project and within the same timeframe, the cumulative risk of construction-related impacts on water resources would increase.

In some locations, other large projects could be developed during a similar timeframe and in the vicinity of the light rail alternatives. If Sound Transit's OMSF were located at the Lynnwood site, there is the potential for increased impervious surfaces, fill impacts within the Scriber Creek floodplain, and the loss of adjacent wetland or riparian buffer. However, much of the area that potentially would be occupied by the maintenance facility is already developed, and a redevelopment to current stormwater management standards could help improve existing problems with water quality management.

Additional areas that could be developed by other projects include the master-planned Edmonds School District support services center, which would include administrative facilities and a school bus base in Lynnwood on a district-owned site that overlaps with a portion of Sound Transit's maintenance facility alternative in Lynnwood. The school district site is partly developed already, but the development could increase pollution-generating impervious surface in the Scriber Creek Basin. The school district project would prevent or minimize impacts to water resources by meeting the current stormwater management standards required by construction permits; therefore, no cumulative impacts are expected.

4.9.6 Potential Mitigation Measures

The project would be designed to comply with all federal, state, and local regulations, which would prevent or minimize potential impacts to water resources through project planning, design, and the application of required BMPs (see Section 4.9.3 and Appendix I-4.9). Measures to prevent or minimize long-term impacts include LID approaches, where applicable, and stormwater flow control and water quality treatment as identified in Table 4.9-1. Sound Transit will comply with the NPDES permit program, and will implement measures defined for the project through its construction SWPPP. With these impacts controlled, as described in Sections 4.9.2 and 4.9.3, no operational or construction-related adverse impacts on water resources are expected and no mitigation is required.

The project design would include avoidance and minimization measures to prevent cumulative impacts to water resources by other projects constructed within the vicinity of the Lynnwood Link Extension and within the same timeframe. These measures would adhere to applicable regulatory standards, the Ecology NPDES Construction General Permit, and the WDFW Hydraulic Project Approval.

4.10 Energy

This section discusses the project's use of energy for construction and operation, and the potential for indirect and cumulative changes in energy used for regional transportation. Energy use is often expressed in terms of a standard measure known as the British thermal unit (Btu). At the regional scale, the units are counted in the millions to trillions (mBtu or tBtu, respectively).

4.10.1 Affected Environment

With an annual consumption of 2,195 tBtu, Washington consumes more energy than it produces. Of the 2,195 tBtu consumed in 2012 in the state, roughly 48 percent came from fossil fuels (43 tBtu from coal, 272 tBtu from natural gas, and 743 tBtu from petroleum). Renewable energy was the second highest energy source consumed, at approximately 47 percent (1,039 tBtu), and nuclear energy was third at 4 percent (98 tBtu) (EIA 2014a).

In 2012, transportation was the highest end-use energy consumption sector in the state at roughly 30 percent (619.8 tBtu), followed by industrial at 28 percent (582.1 tBtu), residential at 23 percent (479.6 tBtu), and commercial at 18 percent (375.1 tBtu) (EIA 2014a).

The study area for energy is the four-county Central Puget Sound urbanized area (King, Snohomish, Pierce, and Kitsap counties) regional transportation network. According to the PSRC travel demand model, which provided the base transportation data used in this analysis, most regional miles traveled are in passenger cars and light trucks. Public transit accounts for less than 1 percent of the regional miles traveled. Compared to the No Build Alternative, potential transit improvements would reduce motor vehicle use within the study area, as well as increase travel on Sound Transit's light rail network, this analysis evaluates existing energy consumption of these transportation modes. The proposed project would also affect public transportation provided by other agencies because the Lynnwood Link Extension could reduce the need for other transit routes that would otherwise be operating under congested conditions; therefore, energy consumption from other public transportation agencies is included in this analysis. Energy consumption per mile for transit vehicles is listed in Table 4.10-1 along with the estimated 2011 energy consumption based on vehicle miles traveled.

Table 4.10-1. Existing (2011) Daily Vehicle Energy Consumption in the Study Area

Travel Mode	Btu per Vehicle Mile[a]	2011 Daily Vehicle Miles Traveled	2011 Daily Energy Consumption (mBtu)
Bus[b]	37,718	254,100	9,584
Commuter Rail	92,474	960	89
Light Rail	64,585	4,430	286
Total Transit Energy Consumption	—	*259,490*	*9,959*
On-Road Vehicles (including automobiles, light trucks, medium trucks, and heavy trucks)	—	79,442,960	532,429

[a] Transportation Energy Data Book, Edition 32, Table 2.12 (2013)

[b] Bus vehicle miles traveled include King County Metro, Pierce Transit, Everett Transit, Community Transit and Sound Transit buses.

Energy consumption for passenger vehicles was developed using EPA's MOVES model version 2010b (released in June 2012). For this analysis, PSRC provided regionally specific MOVES input files, and national defaults were used when regionally specific inputs were not available. Vehicle miles traveled by mode and associated energy consumption are listed in Table 4.10-1. Total transit and passenger vehicle energy consumption for 2011 is shown in Table 4.10-2. As indicated in this table, passenger vehicles and trucks consume the most transportation energy within the study area.

Table 4.10-2. Total 2011 Energy Consumption in the Study Area

Travel Mode	2011 Daily Energy Consumption (mBtu)	Percentage of Total Daily Energy Consumption
Transit Energy Consumption	*9,959*	1.8%
On-Road Vehicles (including automobiles, light trucks, medium trucks, and heavy trucks)	532,429	98.2%
Total	***542,388***	

4.10.2 Long-Term Impacts

The proposed project's long-term impacts would change energy consumption for transportation along roadways, and change energy use by the public transit system. The analysis applies to all alternatives because their operation and ridership characteristics are similar. Table 4.10-3 shows the estimated 2035 energy consumption for the No Build Alternative and for the Preferred Alternative by vehicle type.

Table 4.10-3. 2035 Energy Consumption by Travel Mode (mBtu)

Travel Mode	No Build Alternative in 2035[a]		Light Rail Preferred Alternative in 2035[a]		Daily Energy Consumption Change from No Build Alternative in 2035[a] (percent)
	Daily Vehicle Miles Traveled	Daily Energy Consumption (mBtu)	Daily Vehicle Miles Traveled	Daily Energy Consumption (mBtu)	
On-Road Vehicles (including automobiles, light trucks, medium trucks, and heavy trucks)	100,592,498	591,488	100,307,852	588,820	-0.5%
Bus	243,000	9,165	240,400	9,067	-1.0%
Heavy Rail	1,470	980	1,470	980	0.0%
Light Rail	13,600	878	17,900	1,156	31.7%
Weekday Daily Total	***100,850,568***	***602,511***	***100,567,622***	***600,023***	***-0.4%***

[a] The energy calculations do not assume the most recent and likely future updates to EPA's fuel economy and emission standards. Other state and federal legislation also could reduce future energy consumption rates. Thus, actual 2035 energy consumption could be lower.

No Build Alternative

The transportation energy forecasts for the No Build Alternative account for other planned transportation projects as well as the increased travel demand based on future land use, population, and employment. These forecasts also consider predicted changes in vehicle fuel consumption as future vehicles become more efficient; however, the current models do not yet assume the most recent or likely future updates to EPA's fuel economy and emission standards. Still, while overall miles traveled would increase by nearly 27 percent by 2035, energy consumption for transportation would increase by less than half that, or 11 percent.

Light Rail Alternatives

The travel forecasts combined the Preferred Alternative from each project segment (A, B, and C) to provide a representative prediction of regional travel for the project, even if other alternative combinations by segment were used. Although the individual light rail alternatives would have some differences in ridership, the changes in roadway operating conditions and travel by mode at the regional level would be statistically similar to the Preferred Alternative. All the light rail alternatives are expected to primarily shift commuters from automobiles and light trucks to light rail as well as from bus transit to light rail. These shifts in travel mode are expected to occur throughout all periods of the weekday, with the most dramatic shifts occurring in the morning and evening peak periods, which is consistent with the typical work commute times. Energy consumption would decrease by about half of 1 percent as a result of the mode shift as well as the higher operating speeds on roadways, which improve fuel economies for all vehicle classifications.

Sound Transit published a *Sustainability Plan* in 2011 that builds on the 2007 Sustainability Initiative. It commits Sound Transit to integrate efficient operating practices at existing and new facilities, using energy-saving equipment to reduce energy demand, and maximizing intermodal transit connections to reduce automobile VMT. Many of these practices have been incorporated into the initial Central Link light rail segment that began operating in 2009. The *Sustainability Plan* identifies a long-term energy target in which all fleets would deploy fuel-efficient, clean, and cost-effective vehicles to optimize the use of proven technologies. It also identifies initiatives to develop and implement an energy management strategy and to continue to develop and implement fuel reduction strategies for Sounder commuter rail, ST Express buses, and the non-revenue fleet. Sound Transit's design standards for light rail also require designers to maximize the energy efficiency of transit facilities, buildings, and systems. Implementing the *Sustainability Plan* and Sound Transit's design standards could further reduce energy consumption during Lynnwood Link Extension construction and operations.

4.10.3 Construction Impacts

Using the Preferred Alternative as representative of all alternatives, Sound Transit estimated the construction-related energy consumption of the project. The estimate uses a method developed by the California Department of Transportation (Caltrans). The Caltrans method applies energy consumption rates to the various construction activities and quantities identified by the design team for developing construction cost estimates. These estimates are summarized in Table 4.10-4.

The estimate for the Preferred Alternative construction-related energy consumption is 5,171,499 mBtu, the sum of the total construction energy consumed by segment as shown in Table 4.10-4.

During final design, Sound Transit would identify and implement sustainability measures consistent with its Sustainability Program, which includes a variety of energy-saving protocols and practices.

Energy used during construction and in the manufacture of construction materials would be irretrievable. However, the proposed project would not adversely affect the continued availability of energy because the scale of the project is negligible when compared to energy production in Washington.

Table 4.10-4. Light Rail Preferred Alternative Construction Energy Consumption (mBtu) by Segment

Description	Segment A	Segment B	Segment C	Total
Length (Miles):	4.5	3.0	1.0	8.5
Number of Stations:	2	1	1	4
Guideway and Track Elements (mBtu)	1,415,200	1,291,011	521,722	3,227,933
Stations, Stops, Terminals (mBtu)	440,006	193,612	553,962	1,187,580
Sitework and Special Conditions (mBtu)	253,891	74,361	23,933	352,185
Systems (mBtu)	209,071	138,174	56,556	403,801
Total Construction Energy (mBtu)	**2,318,168**	**1,697,158**	**1,156,173**	**5,171,499**

Note: Estimates are based on preliminary construction cost estimates developed by the project team in July 2014; they do not include change order contingency; right-of-way, land, and existing improvements; vehicles; professional services; unallocated contingency; or high-estimate factor (15 percent).

4.10.4 Indirect and Cumulative Impacts

There are no long-term indirect impacts associated with this project because energy consumption used in operating the light rail extension would be a direct impact. Cumulative impacts of the proposed project are accounted for in the regional scope of the travel demand model used for this energy consumption analysis. Operating light rail would result in less energy usage than the No Build Alternative; therefore, this project would not contribute to the cumulative impacts of increased energy consumption in the region. The cumulative energy impacts of additional projects, such as the OMSF or the Edmonds School District support services center, would be negligible on the regional scale.

4.10.5 Potential Mitigation Measures

No mitigation measures would be needed for the Lynnwood Link Extension long-term or construction impacts. The light rail alternatives would consume less energy compared with the No Build Alternative because of the shift in travel mode to light rail, which would also reduce traffic congestion. Mitigation measures proposed for transportation and air quality impacts (see Section 3.6 in Chapter 3, Transportation Impacts and Mitigation, and Section 4.6, Air Quality and Greenhouse Gases) would also result in reduced energy consumption during construction.

4.11 Geology and Soils

This section describes the existing geological conditions that could affect or be affected by the Lynnwood Link Extension, including topography, regional geology, groundwater, seismicity, and geologic hazards.

4.11.1 Affected Environment

This section discusses the geology and soils in a study area extending 100 feet from the light rail alternatives. Sound Transit also researched the geologic units and soil characteristics in the larger project area by reviewing existing geologic maps and surveys, including geotechnical reports for previous projects in and near the project area. These sources included logs of over 700 borings and test pits completed in or near the study area since 1962, and logs of almost 100 borings completed for preliminary design of this project.

Topography, Regional Geology, Groundwater, and Seismicity

The project would be located within the central Puget Lowland, a north-south trending trough bordered by the Cascade Mountains to the east and the Olympic Mountains to the west. The existing topography and regional geology have been largely shaped by glacial activity.

The regional geology generally includes a thick sequence of glacially consolidated soils overlying bedrock, which is generally 300 feet to 1,600 feet below the ground surface in the project area. Under the weight of the glaciers, the underlying soils became consolidated and are generally very hard or compact. More recent soils have been deposited over the glacially consolidated soils by lake and river actions.

Figure I-4.11-2 in Appendix I-4.11, Geology and Soils, shows the surficial geology of the project area, and Table I-4.11-1 in the same appendix describes the geologic units and their engineering properties.

Where pervious soils are present at the ground surface, rainfall and snowmelt infiltrate to sustain typical shallow water table or perched groundwater conditions. In upland areas of the project where glacial till is present at or near the surface, the upper portion of the till and/or the thin veneer of overlying sediments can develop perched groundwater conditions because the underlying till has low permeability and water percolates into the till only at very slow rates. Such groundwater occurrences are commonly seasonal, developing through the wet winter months and diminishing or drying out completely during the dry summer months.

Groundwater that percolates into the glacial till moves downward slowly to eventually recharge an aquifer, which is usable as a water resource. However, none of the aquifers present along the project alignment are used for municipal or private water supply.

In some portions of the study area, groundwater is present throughout the year within confined and unconfined aquifers in permeable soils. Groundwater levels are usually tied to adjacent stream conditions, with levels increasing during the wet winter months and lowering as they feed the streams during drier weather

conditions. Near Thornton Creek, borings have encountered groundwater under moderate artesian pressure.

The Puget Sound region has experienced numerous earthquakes in the past and will experience earthquakes in the future. This region is located at the convergent continental boundary known as the Cascadia Subduction Zone. Three major types of earthquakes occur in this zone, which contribute to the overall earthquake hazard.

Shallow crustal earthquakes involve movement within the crust of the North American Plate. This movement tends to occur along faults such as the Seattle Fault (9 miles south of the project area) and the South Whidbey Island Fault (3 miles north of the project area); the Seattle Fault last ruptured 1,100 years ago and the South Whidbey Island Fault last ruptured 3,000 years ago. Intraplate earthquakes occur within the subducting Juan de Fuca Plate at depths of 20 to 40 miles. Relatively recent intraplate earthquakes include the Olympia 1949, Seattle 1965, and Nisqually 2001 events. Even larger earthquakes involve movement along all or a portion of the Cascadia Subduction Zone and represent the largest anticipated earthquakes for the region; the most recent occurred just over 300 years ago in 1700.

Geologic Hazards

Washington State's GMA (RCW Chapter 36.70A) requires all cities and counties to identify critical areas within their jurisdictions and to formulate development regulations for their protection. The GMA defines critical areas, including geologically hazardous areas, as areas that are susceptible to erosion, sliding, earthquake, or other geological events and are therefore not suited to the siting of commercial, residential, or industrial development consistent with public health or safety concerns.

The Lynnwood Link Extension would pass through four cities and two counties, all of which have defined geologically hazardous areas in their respective codes (see Figure I-4.11-1 in Appendix I-4.11, which shows geologic hazardous areas). These geologic hazards include the following:

- Erosion hazard areas (generally encompassing the entire project area), with surficial soils that are prone to erosion if left exposed.
- Steep slope hazard areas, with grades between 15 and 40 percent, that might move during wet weather or seismic events.
- Landslide hazard areas where past slides have occurred, where the soil types under steep slopes make them unstable, or any areas where the slope is steeper than 40 percent. There are no known past landslides in the project area.
- Seismic hazard areas subject to earthquake-induced ground shaking or fault displacement. Shown in Figure I-4.11-1 in Appendix I-4.11, these areas have saturated loose granular soils that can liquefy and become unstable during an

earthquake (referred to as liquefaction). The project area is located outside known fault zones; therefore, the risk of fault displacement is low.

- Settlement hazard areas, with soft or loose soils that could experience significant settlement under the weight of new fill or structures.

Sole-Source Aquifers

The project would not be located within an EPA-designated sole-source aquifer area (EPA defines a sole-source aquifer as the primary source for drinking water in a given area). The nearest is Cross Valley Sole-Source Aquifer, which is located at least 3 miles east of the I-5 corridor.

Critical Aquifer Recharge and Wellhead Protection Areas

Aquifer recharge areas restrict developments that could affect sources for groundwater used for potable water supplies. Wellhead protection areas designated by local jurisdictions also help control activities involving potential sources of pollutants. The project would not be located within the boundaries of a King County or Snohomish County critical aquifer recharge or wellhead protection area.

Site Geology

The topography along the entire project corridor was substantially modified during construction of I-5 with engineered cuts and fills to create the existing freeway corridor. The light rail alternative routes within Segments A and B have similar geological conditions, but in Segment C the geological characteristics may vary slightly among the alternative routes. Most of the project area is underlain by glacial till and advance outwash. These soils are considered favorable for support of light rail, with good bearing support and little settlement, but several areas also include soils that would be subject to liquefaction. These areas include:

- Near Thornton Creek (south of NE 145th Street in Segment A)
- North and south of the King-Snohomish county line (in Segment B)
- Near Hall Lake (in Segments B and C)
- Near Scriber Creek (Lynnwood Transit Center in Segment C)

4.11.2 Long-Term Impacts

During preliminary design, Sound Transit conducted geotechnical borings and detailed soil analyses to inform and refine potential design and construction approaches to avoid potential impacts and geological risks during light rail operations. This section summarizes potential long-term operational impacts from the Lynnwood Link Extension and the No Build Alternative.

No Build Alternative

Under the No Build Alternative, the Lynnwood Link Extension would not be constructed. While there may be other localized projects, there are no major projects in the project corridor that would change existing geological and soils conditions.

Impacts Common to All Light Rail Alternatives

The discussion below considers long-term impacts that the proposed project could cause, as well as geological conditions that could affect the project. Sound Transit anticipates that the overall impacts would be similar among the alternatives.

Elevated guideway structures and light rail stations would both likely have shallow foundations (approximately 6 feet to 10 feet deep) or drilled shaft foundations (approximately 40 feet to 60 feet deep).

Retaining structures would be required in many areas along the routes of the alternatives. Some could require permanent soil anchors that extend beyond the limits of the study area onto adjacent properties, which would require permanent easements and could affect the future use of neighboring properties. Retaining structures can affect or be affected by local groundwater movement and seepage. Their design would provide appropriate means of drainage or waterproofing.

Parking structures would likely be supported on shallow foundations (approximately 6 feet to 10 feet deep) or drilled foundations (approximately 30 feet to 50 feet deep); ground improvement may also be used, likely in combination with shallow foundations. Surface lots would be supported at-grade.

Surface water runoff from impervious areas such as parking structures and station buildings would be managed with stormwater facilities described in Section 4.9, Water Resources. These would include infiltration facilities that discharge most or all of the collected stormwater to the ground (after appropriate treatment). Municipalities in Western Washington are required to maximize the use of LID techniques for new projects because they recharge aquifers, improve the base flow to streams, and reduce the risk of flooding, erosion, and surface water contamination.

Overall, the risk of adverse impacts on light rail facilities is low because the design would address potential impacts that could be caused by the geological conditions and/or soils in the project right-of-way. The potential impacts on the light rail facilities would be similar among the alternatives, with slight variances arising from the available space for construction; proximity of existing structures; loads from adjacent slopes; soil type; and steep slope, settlement, and seismic hazards (particularly liquefaction).

Insufficient Stability of Earth Slopes and Retaining Structures

Insufficient stability of earth slopes and retaining structures could endanger light rail facilities, light rail passengers, and neighboring properties. Earth slopes could include

existing slopes, slopes that are steepened, and slopes for embankment fills. These would generally be areas identified as steep slope and landslide hazard areas. The risk of insufficient slope stability would be greater when a large seismic event occurs.

The overall risk from unstable slopes and retaining structures is low because Sound Transit has evaluated these risks during project design and would increase the stability of the slope and retaining structures to acceptable levels. If slopes intersect perched groundwater or the water table, the project would collect and drain seepage to prevent erosion and loss of soils by piping or sloughing that could otherwise compromise long-term slope stability.

Settlement of New Earth Fills

New earth fills would be used in some areas to support light rail structures, but the fills would typically include retaining structures to limit the extent of the fill. The fills would cause increased loads on the soil and could result in settlement of soft soils, which could damage light rail structures as well as existing improvements.

Most of the new earth fills would be located in areas underlain by glacially consolidated soils, which are not expected to experience significant settlement. The light rail alternatives would use elevated structures to cross over most areas underlain by soft soils (wetland deposits, younger alluvium, and recessional outwash), which would reduce the risk of settlement in these areas.

The overall risk of settlement along the project corridor is low. Project design would incorporate measures to improve the soils in locations with the potential for settlement, or would allow tolerances for anticipated settlement.

Seismic Ground Shaking

The elevated light rail and retaining structures would be designed to withstand the effects of seismic ground shaking, thereby minimizing the risks to rail facilities and users. Sound Transit light rail design standards are based on the occurrence of a rare and large seismic event; therefore, the risk of damage from seismic ground shaking would be low.

4.11.3 Construction Impacts

The construction impacts of the Lynnwood Link Extension would be similar for all light rail alternatives because construction equipment and techniques would be similar. Construction activities could cause various geology- and soils-related impacts on a short-term basis. If not properly managed, the short-term construction impacts could become long-term problems.

Erosion

Construction activities could expose soils to rainfall and potential erosion through vegetation and tree removal, excavation and grading, and stockpiling of soils. The risk of erosion is a function of the soil type, slope inclination, presence of perched or shallow

groundwater, area of soil exposed, and rainfall intensity. Erosion hazards would be reduced using BMPs described in Section 4.9, Water Resources.

Slope Instability and Excavations

Construction would include removal of vegetation, excavation of temporary and permanent cut slopes, placement of earth embankment fills, and construction of retaining structures. These activities could affect the stability of slopes, particularly in steep slope and landslide hazard areas.

Slopes and retaining structures would be evaluated and designed for adequate stability using appropriate techniques, such as limiting slope inclination, limiting surcharge loading, or adding slope reinforcement such as soil nails. Shallow or perched groundwater intersected by cut slopes or other excavations would require drainage to control seepage and prevent it from contributing to slope instability.

Existing soils excavated during construction that cannot be used as structural fill would be disposed of. This would result in additional truck traffic, dust, and other construction-related impacts.

Table 4.11-1 shows the estimated total cut-and-fill earthwork quantities for the Preferred Alternative and the other light rail alternatives.

Table 4.11-1. Estimated Earthwork Quantities (in cubic yards)

Alternative(s)	Cut[a]	Fill[a]
Preferred Alternative A[b]	227,000	180,000
A1, A5, A10	214,000	67,000
A3, A5, A11	83,000	32,000
Preferred Alternative B	56,000	66,000
B1	98,000	23,000
B2A	123,000	33,000
B4	92,000	54,000
Preferred Alternative C	28,000	0
C1	11,000	0
C2	10,000	0
C3	9,000	0

[a] Includes calculations of the areas with cuts or fills needed for elevated or at-grade structures, with a 50 percent addition for station earthwork and a contingency amount reflecting the early stage of design information available.
[b] The Preferred Alternative's fill estimates also include retained fill structures transitioning to elevated structures based on updated design information.

Seismic Ground Shaking

Seismic ground shaking could occur during light rail construction, and the impacts would be similar to those previously discussed. If a large earthquake occurred during construction, the major risk would be damage to facilities under construction. The risk of seismic ground shaking is low due to the low probability of an earthquake occurring during the construction window.

Settlement from Construction Earth Loads

Construction earth loads would result from temporary stockpiling and the placement of new earth for embankments. The risk of settlement from construction earth loads is low. During the design process, Sound Transit would identify areas where soft soils could settle and avoid these areas or take other measures to protect against settlement damage.

Dewatering

Sound Transit does not anticipate dewatering for construction. Drilled shaft foundations are the primary project element that would extend below the groundwater table. Shafts would be completed without dewatering, and may even require the addition of water during installation ("water heading") to prevent heaving conditions at depth.

If dewatering is required, the design process would consider the potential effects of dewatering-induced settlement on nearby structures. Sound Transit would reduce settlement by using localized dewatering, reinjecting groundwater, using sheet piles for groundwater cutoff, or underpinning nearby structures.

4.11.4 Indirect Impacts

Although other developments could occur in the station areas, any new development would be built to meet current design standards and permit requirements. Permanent soil anchors could be used for major structures, which could restrict excavations for new developments within the anchor zone. However, such restrictions would be limited and alternative design remedies could be used.

4.11.5 Cumulative Impacts

A few proposed projects in the project area could alter geological or soil conditions, including Sound Transit's OMSF alternative in Lynnwood and the Edmonds School District's support services center. Both of these projects would require earthwork and other construction-related activities, but these would not add to the Lynnwood Link Extension's impacts.

4.11.6 Potential Mitigation Measures

With appropriate use of engineering design standards and BMPs as described above in Section 4.11.3, Sound Transit does not expect adverse geological and soils impacts.

4.12 Hazardous Materials

This section discusses the potential for the Lynnwood Link Extension alternatives to encounter existing hazardous materials that could pose risks to human health and/or the environment or could create control or cleanup requirements for the project. It also discusses the potential for the project to introduce new sources of hazardous materials contamination.

Hazardous materials can be classified in a number of different categories based on laws and regulations that define their characteristics and use. These categories include hazardous waste, dangerous waste, hazardous substances, and toxic substances.

4.12.1 Affected Environment

The hazardous materials study area extends 1/8 (0.125) mile around the light rail alternatives (project footprint). Contaminated sites within this area are considered the most likely to affect the project. Because of the nature of hazardous materials, pollutants could migrate toward the project from nearby sites, typically through groundwater migration. To address this potential risk, Sound Transit considered the physical setting, including geologic, surface water, and hydrologic conditions, and collected regulatory database information about sites with known contamination or potential contamination, as well as relevant historical conditions, within 0.25 mile of the project footprint; this area is shown as the Search Area in Figure 4.12-1. This was a conservative approach to ensure that all hazardous materials sites that could potentially affect the study area were captured in the database review.

Physical Setting

The project corridor is located within the Central Puget Lowland ecoregion, where the existing topography and regional geology have been largely shaped by glacial activity. The terrain in the study area features valleys and hills varying by up to 300 feet in elevation. The region is mostly underlain by Vashon Till, and surface soils in the study area generally consist of a mixture of sands, silts, and gravels of varying thicknesses and occurrences.

Depth to groundwater in the study area can vary considerably. However, monitoring well information and local municipal information indicate that, in general, depth to groundwater ranges from less than 10 feet below ground to approximately 30 feet below ground. Groundwater flow direction is also variable and highly influenced by streams and other surface water features. In general, groundwater flow is relatively flat, with a slight gradient to the west toward Puget Sound in much of the study area.

As noted in Section 4.9, Water Resources, the study area lies entirely within the Lake Washington/Cedar/Sammamish Watershed (WRIA 8), which has the greatest urban development and population density of any watershed in Washington.

Contamination issues are of particular concern in sensitive areas, such as wetlands, floodplains, rivers, and creeks.

Hazardous Materials Sites

Sound Transit identified approximately 200 properties with previous records of contamination within or near the study area. While much of the study area is residential, with few sites of past contamination, there are areas where businesses or other entities have used hazardous materials, or where spills or leaks have occurred. These are mostly along arterials and in areas with commercial, manufacturing, or industrial uses. Sound Transit considered the potential of each site to act as a contaminant source affecting the project footprint and ranked them based on:

- Location of the site (relative to the project footprint)
- Type and number of environmental database listings
- Occurrence of a known release of a hazardous substance(s) or petroleum product
- Status of cleanup—active, inactive, or unknown; all sites are considered active unless identified as having no further action or inactive status

Sites were ranked on a scale of 0 to 5 (lower priority concern to higher priority concern) as follows:

0 – Identified site is more than 1/8 mile from the project footprint.
1 – Identified site is 1/8 mile or less outside the project footprint and has had no confirmed or suspected release.
2 – Identified site is within the project footprint and is not known to have had a confirmed or suspected release.
3 – Identified site is 1/8 mile or less outside the project footprint and has had a confirmed release.
4 – Identified site is within the project footprint and has had a confirmed or suspected release; however, no further action is required or pending.
5 – Identified site is within the project footprint, has had a confirmed or suspected release, and cleanup activities at the site are active.

Figures 4.12-1a and 4.12-1b show the location and ranking of the hazardous materials sites identified in the study area. Figure I-4.12-1 in Appendix I-4.12, Hazardous Materials, shows the highest ranked sites (4 and 5) and their proximity to the alignment and potential acquisition parcels. A higher ranking indicates sites of higher concern because of the type and extent of their contamination and location relative to the alternatives. In Appendix I-4.12, Table I-4.12-1 lists all sites found in environmental databases and their environmental database number (EDR ID); Table I-4.12-2 shows the distance of each site from the project footprint and its corresponding rank; Table I-4.12-3 lists the higher priority hazardous materials sites (sites listed as a 4 or 5). Information on all higher priority sites identified within, or adjacent to, the Preferred Alternative was obtained (where available) to confirm conditions and current status of sites (EDR 2012a, 2012b). These sites are discussed in greater detail in Section 4.12.3, Construction Impacts.

4.12.2 Long-Term Impacts

This analysis of the project's long-term direct impacts considered long-term operation and maintenance activities. An operating transit facility could cause long-term impacts if there were an accidental release of hazardous materials, such as a fuel spill. Because light rail trains operate on electricity and not fuel, major spills are unlikely; however, minor hazardous material releases could result during maintenance activities on the tracks or at the stations and park-and-ride facilities where buses and automobiles operate. Sound Transit has an established hazardous materials handling plan and program for responding to emergencies within its system, including a spill response. There is generally a low potential for impacts from ongoing system operations under all the light rail alternatives.

If Sound Transit purchases a contaminated property for project use, the agency might need to conduct cleanup activities (see Figure I-4.12-1 in Appendix I-4.12). Although this could affect project costs, it would also be an environmental benefit. Most of these cleanups would occur during light rail construction and are discussed under Section 4.12.3, Construction Impacts. A site with complex hazardous materials concerns can require remediation actions in the long term, such as deed restrictions that would affect further site uses, or additional monitoring or maintenance. However, an environmental restoration plan that specifies the regulatory process, cleanup actions, and associated costs and schedule would be implemented for longer-term remediation actions.

No Build Alternative

The No Build Alternative would not acquire potentially contaminated sites. Ongoing bus transit operations under the No Build Alternative would involve hazardous materials, but systems are in place to manage potential releases through spills or accidents.

Segments A and B: Seattle to Mountlake Terrace

There are no high priority hazardous materials sites located on parcels identified for acquisition within Segments A and B. However, there is the potential to encounter contamination from known or unknown hazardous materials sites in the study area.

Segment C: Mountlake Terrace to Lynnwood

Under each of the Segment C alternatives, Sound Transit would acquire all or parts of parcels that contain hazardous materials sites. Seven sites of high concern were identified within the alternatives; four of these sites are located within the Preferred Alternative. While most of these sites have already been remediated, residual contamination could remain, requiring additional cleanup.

The Preferred Alternative and Alternative C1 would affect a service station site (Chevron 94953) that poses a higher level of concern than sites the other light rail alternatives would encounter. While contamination at most of the sites would be addressed before and during project construction, as discussed in more detail under Section 4.12.3, Construction Impacts, the Chevron site could require ongoing active remediation, monitoring, or other protective measures or restrictions. Each site would be handled consistent with applicable regulations and approvals.

4.12.3 Construction Impacts

During construction, direct impacts could result from the presence of hazardous materials on a site or the use of hazardous materials. Table I-4.12-1 in Appendix I-4.12 lists the environmental databases in which the identified hazardous materials sites were recorded. Soils, sediments, surface water, stormwater, and groundwater can be adversely affected by existing contamination or the release of hazardous substances during construction activities. Construction impacts could occur when contaminated soil, groundwater, underground storage tanks (USTs), and/or leaking underground storage tanks (LUSTs) that contain hazardous materials are encountered during construction activities. Hazardous materials could be encountered during excavation, grading, dewatering, drilling, and demolition activities. Construction or demolition can create or expose contaminated materials, such as treated timbers; contaminated soil, sediment, and groundwater; transformers; abandoned waste; and lead or asbestos-containing materials in demolished structures. Both elevated and at-grade construction could encounter hazardous materials during in-ground work; however, the potential for the elevated options is less due to less in-ground work required.

Fuels and other hazardous materials such as lubricants are also used during construction. Spills of any size could cause harm to the environment if not contained. Hazardous materials could affect worker safety and public health during construction, although the handling of contaminated materials is regulated at the state and federal levels. Workers could be exposed through skin contact and inhalation of contaminated vapors or particulates, such as during excavation work, demolition, or the use of materials containing hazardous substances.

Contaminants encountered or released during construction can migrate into the environment through various pathways. Shallow soil contamination can migrate downward into subsurface soils and/or groundwater through "drag-down" from excavation, utility relocation, drilling, stormwater infiltration, or dewatering.

Segment A: Seattle to Shoreline

Four hazardous materials sites of concern were identified near all of the light rail alternative alignments in Segment A. However, these sites (Table 4.12-1) are not located on parcels that might be acquired by Sound Transit, and are not likely to affect the Segment A light rail alternatives. An additional site was also found near the Preferred Alternative, due to a partial acquisition of a tax lot that extends well beyond the project area (Northgate Mall; EDR #183).

Table 4.12-1. Higher Priority Hazardous Materials Sites Adjacent to Segment A Alternatives

EDR ID Number	Owner Name	Address	Rank	Potentially Affected Alternatives						
				Preferred Alternative	A1	A3	A5	A7	A10	A11
Segment A										
183	Northgate Mall	555 Northgate Mall	4	●	●	●	●	●	●	●
178	WSDOT I-5/Northgate	1st Avenue NE and NE 110th Street	4	●	●	●	●	●	●	●

124	WSDOT	Interstate 5 and NE 185th Street	4	●	●	●	●	●	●	●

Segment B: Shoreline to Mountlake Terrace

Sound Transit identified two hazardous materials sites of concern near, but not on, parcels that might be acquired by Sound Transit. Therefore, they are not likely to affect any of the Segment B light rail alternatives.

Table 4.12-2. Higher Priority Hazardous Materials Sites Near Segment B Alternatives

EDR ID Number	Owner Name	Address	Rank	Potentially Affected Alternatives

N/A = not applicable; PUD = Public Utility District

Segment C: Mountlake Terrace to Lynnwood

Sound Transit identified nine hazardous materials sites (from industrial, manufacturing, public utility, transportation, and service station sites) in Segment C that have generated past releases of contaminants to soil and groundwater. Four are located on parcels that Sound Transit would acquire for the Preferred Alternative, and two are adjacent to it (Table 4.12-3).

Table 4.12-3. Higher Priority Hazardous Materials Sites In and Adjacent to Segment C

25	Shell Station 120839	19930 44th Avenue West	5	●	●	●	●

N/A = not applicable

The elevated profile of the Segment C alternatives would lessen (but not eliminate) the need for excavation in contaminated soils.

The Chevron 94953 (Site ID# 28; 44th Avenue West and 200th Street SW) service station site is of concern because it is an ongoing cleanup site that would be acquired by Sound Transit for the Preferred Alternative as well as for Alternative C1.

The site includes benzene and gasoline contamination confirmed in groundwater and soil in 1990. Groundwater monitoring has been conducted since that time. In 2007, 2008, and 2009, Ecology concluded that the site required further actions. In September 2009, a 1,000-gallon used oil UST and three fuel dispenser islands were decommissioned, and a new 8,000-gallon diesel UST was installed. Petroleum and benzene, toluene, ethylbenzene, and xylenes (BTEX) were detected in soil samples collected from the central dispenser island excavation. Approximately 734 tons of contaminated soil were excavated and removed from the site. There was reportedly evidence of affected soil remaining near the central and northeastern dispensers (Conestoga-Rovers & Associates 2009).

The site is still active, and regulatory action continues. Potential on-property sources of contamination include the current and former USTs located in the central and southern portions of the site; fuel dispenser islands and conveyance piping, located in the central and southern portions of the site; and the former waste oil and heating oil USTs located in the central portion of the site. Construction activities are expected to encounter existing contamination in the soil and groundwater. Thus, acquisition of the property and/or construction activities associated with the Preferred Alternative would likely require remedial actions or monitoring, regulatory interactions, and/or liability negotiations and protections with the site owner.

4.12.4 Indirect and Secondary Impacts

Construction of the Lynnwood Link Extension could result in redevelopment of existing structures and/or paved areas, as opposed to development of natural areas. Existing contamination is more likely to be encountered or potentially released during redevelopment activities in older urban areas. Redevelopment of older structures in the study area may result in the cleanup of hazardous materials sites, which would be an indirect benefit of the project.

4.12.5 Cumulative Impacts

The trend in managing hazardous materials impacts is toward cleanup. Federal and environmental regulations have resulted in the identification and cleanup of past hazardous materials sites, and in fewer hazardous materials spills and releases. Because encountered hazardous materials must be cleaned up or remediated during project development, future development projects, with or without the Lynnwood Link Extension, would accelerate the cleanup of existing contaminated sites in the study area.

If the Lynnwood site (near the Lynnwood Transit Center) were selected for the proposed OMSF, that project could acquire properties associated with inventoried hazardous materials sites. Operation of this facility would involve storage and handling of some hazardous materials associated with vehicle maintenance. Sound Transit would handle these materials in accordance with applicable state and federal regulations, and the facility would not be a source of additional cumulative effects related to hazardous materials. The Edmonds School District's proposed support center and bus facility near 52nd Avenue West would also have storage and handling of hazardous materials, but no additional cumulative impacts are expected if they are handled consistent with applicable rules.

4.12.6 Potential Mitigation Measures

Sound Transit would adhere to applicable regulations regarding hazardous materials handling and spill response during construction and long-term operation of the Lynnwood Link Extension; as a result, the project would not have an adverse effect

on the environment, but could have a net beneficial impact. When encountered, contaminated sites would be cleaned up or contained, in compliance with regulations, to the extent that would allow for project construction.

Ideally, Sound Transit would minimize potential long-term impacts from contaminated sites by avoiding contaminated sites or portions of such sites. However, the project area has other physical, environmental, or topographic constraints in many locations. To avoid impacts from potential contaminated sites in the project area, Sound Transit would perform environmental due diligence for properties along the project corridor before property acquisition, and attempt to avoid contaminated sites, where feasible.

Typical environmental due diligence includes the completion of environmental site assessments, which become more detailed if past contamination is identified. Phase I environmental site assessments help identify liability issues associated with acquiring or building on a facility or property. Sound Transit would perform a Phase I site assessment on properties to be acquired or properties that have substantial associated construction activities. A Phase II environmental site assessment might be necessary for property acquisition or for construction purposes if the Phase I site assessment identifies potential contamination. The Phase II site assessment can include the collection of samples of soil, groundwater, and/or building materials. The substances most frequently tested for are petroleum hydrocarbons, metals, pesticides, solvents, asbestos, and/or lead-based paint.

These assessments could establish the condition of acquisition properties and help to determine plans for cleanup and construction management, as needed. Ecology would be notified if unknown contamination is encountered during an assessment. Some previously contaminated properties might require longer-term covenants, restrictions, or other remedial activities, which would be approved by Ecology.

To address potential impacts on environmental resources from construction activities, Sound Transit would implement applicable BMPs. These would include requiring contractors to prepare and implement hazardous materials management plans, construction stormwater pollution prevention plans, health and safety plans, spill control and prevention plans, contaminated media management plans, and lead and asbestos abatement programs, as necessary. These plans would establish the procedures for managing hazardous materials in accordance with state and federal regulations. To the extent practicable, Sound Transit would limit construction activities that might encounter contaminated groundwater or contaminated soil. With these standard practices and measures in place, no adverse impacts are anticipated.

4.13 Electromagnetic Fields

Electric and magnetic fields, known as electromagnetic fields (EMFs), are produced wherever electricity is used. EMFs surround all electrical equipment, appliances, and facilities, including the electrical power lines and electrical devices as proposed in the Lynnwood Link Extension. Although there are no regulatory requirements or exposure limits for EMFs, these fields can result in electromagnetic interference, which can cause disruptions and possibly malfunctions in sensitive equipment. In addition, in certain situations, EMFs can affect human health.

4.13.1 Affected Environment

The study area for identifying potential EMF effects on sensitive equipment and facilities is 200 feet from the proposed project alignment. This area covers all locations where potential EMFs from the light rail facilities and operating light rail vehicles would be more than the ambient EMFs from other common sources, such as automobiles, appliances, or street power lines.

Sources of Electromagnetic Fields

Electric charges and currents create electric and magnetic force fields. The greater the charge or current, the stronger the electric field at a given distance from it. The strength of both electric and magnetic fields decreases rapidly with distance from the source. The many existing electrical power lines and electrical devices in the project corridor create a complex pattern of EMFs in the project area.

Light Rail and Electromagnetic Fields

The power transmission lines that would provide power to the traction power substations along the proposed light rail alternative routes would produce EMFs. EMFs would also be produced by the overhead catenary wires that provide power to the light rail train, and by the individual train cars, especially when they are moving. The electricity needed to operate the cars flows from the overhead catenary wires to the traction motors and other electronic equipment. The amount of electricity flowing would vary depending on whether the train is accelerating, running at steady speed, decelerating, or is stationary. EMFs would be created whenever the train is operating, and the electrical current would be highest when the train is accelerating. The strength of the magnetic field generated by light rail operations diminishes sharply relative to the distance from the tracks.

Potentially Affected Receptors

Based on Sound Transit's projections for EMFs that could temporarily interfere with the operation of sensitive electronics and electrical equipment near the right-of-way,

the project design team reviewed all nearby land uses and facilities that might be sensitive to EMFs. Hospitals or clinics that use sensitive electronic equipment would be typical facilities of concern, as would some broadcast facilities. Most of the properties near the light rail alternative alignments serve residential, open space, or transportation uses. The nearest medical facilities to the Lynnwood Link Extension are more than 1,000 feet away—more than 10 times the distance within which effects would be experienced. No other specialized technical or broadcast uses exist in the project area.

Some types of specialized sound systems can also be affected by EMFs; however, this is unusual.

EMFs also can affect humans. Certain EMF combinations can cause shock and burn injuries through direct contact with energized components, or they can interfere with the operation of electrical and magnetic devices, including heart pacemakers.

4.13.2 Long-Term Impacts

No Build Alternative

The No Build Alternative would not introduce any new sources of EMFs into the project area.

Light Rail Alternatives

There are no potentially sensitive hospital-, clinic- or broadcast-related electronic or electrical receptors located closer than 1,000 feet to the Preferred Alternative or any of the other light rail alternative alignments. The project's system designers have reviewed existing aerial utilities along the alignments to establish the necessary safeguards between light rail electrical systems and other systems. No impacts are anticipated. Receptors external to the light rail system (e.g., the public, nearby residences, institutions, and places of employment) would experience EMFs primarily from the overhead catenary system and the traction power substations. Cables emerging from the substations would carry direct current power, creating EMFs primarily in the static (0 to 3 Hz) frequency range.

Based on Sound Transit's existing operations and on data available from similar light rail systems, the Lynnwood Link Extension alternatives are unlikely to generate EMFs that would pose health concerns.

There are no federal regulations that limit exposure to electric or magnetic fields; however, EMFs at locations of human exposure within and adjacent to the light rail alignment would be considerably below exposure guidelines established by the American Conference of Governmental Industrial Hygienists, including the more

recent guidelines established by the International Commission on Non-Ionizing Radiation Protection, which address known biological effects of EMFs.

4.13.3 Construction Impacts

Sound Transit anticipates no impacts from EMFs during project construction because construction equipment generates negligible amounts of EMFs.

4.13.4 Indirect and Cumulative Impacts

Increases in population and employment along the project corridor could increase the demand for electrical power and could also increase the number of sources and the cumulative intensity of EMFs. The proposed site for the OMSF would increase EMF levels if the facility is sited in Lynnwood near the Segment C alternatives, but the combined levels from that facility and other potential projects would not materially affect people or equipment.

4.13.5 Potential Mitigation Measures

Under all light rail alternatives, EMF impacts from the Lynnwood Link Extension are not anticipated. No mitigation is proposed.

4.14 Public Services, Safety and Security

This section discusses the Lynnwood Link Extension's potential impacts on public services, including fire and emergency medical services (including hospitals), police, solid waste and recycling, schools, and postal services. It also discusses public safety and security issues in the project corridor communities and in the light rail operating environment and facilities.

4.14.1 Affected Environment

The following subsections summarize the primary public services in the project area. Section 4.4, Social Impacts, Community Facilities, and Neighborhoods, has a map showing major facilities (Figure 4.4-4).

Emergency Services and Law Enforcement

Fire and emergency medical services are provided in Seattle by the Seattle Fire Department; in Shoreline by the Shoreline Fire Department, which is a member of King County Medic One; in Mountlake Terrace by Snohomish County Fire District 1; and in Lynnwood by the Lynnwood Fire Department. Table 4.14-1 indicates the response times in 2013 for emergency services by jurisdiction.

Table 4.14-1. Fire and Emergency Response Times by Jurisdiction in 2013

Jurisdiction	Advanced Life Support	Basic Life Support	Fire, Rescue, and Hazardous Materials Response
Seattle	3.74 minutes	3.74 minutes	4.45 minutes
Shoreline	7.19 minutes	5.36 minutes	6.42 minutes (first engine) Full: 10.52 minutes EMS: 6.42 minutes
Mountlake Terrace (Snohomish County Fire District 1)	5:34 minutes	5:47 minutes	Fire: 5:52 minutes
Lynnwood	5.50 minutes	4.31 minutes	7.50 minutes

The Seattle Police Department precinct covering the project area is the north precinct/station at 10049 College Way North in Seattle. The Shoreline Police Department, which operates through a contract with the King County Sheriff's Office, has one police station at 1206 North 185th Street in Shoreline. The Mountlake Terrace Police Department station is located at 5906 232nd Street SW in Mountlake Terrace, in a facility shared by Mountlake Terrace Fire Station 19. The Lynnwood Police Department station is located at 19321 44th Avenue West in Lynnwood.

Table 4.14-2 shows the 2013 crime rates for the jurisdictions in which the Lynnwood Link Extension would travel. Thefts of motor vehicles and thefts from motor vehicles are included in the property crimes total. Table 4.14-3 shows the police response times.

Table 4.14-2. Crime Rates by Jurisdiction in 2013

Jurisdiction	Population[3]	Crimes per 1,000 Residents	Crimes Against Persons per 1,000 Residents	Property Crimes (Total)
Seattle	626,600	56.0	5.9	31,422
Shoreline	53,670	32.9	1.4	1,725
Mountlake Terrace	20,160	28.6	1.7	574
Lynnwood	35,960	70.4	3.0	2,452

Table 4.14-3. Police Response Times by Jurisdiction in 2013

Jurisdiction	Highest Priority[a]	Medium Priority[a]	Lower Priority[a]
Seattle	6.9 minutes	9.2 minutes	Not applicable
Shoreline	3.42 minutes	6.48 minutes	9.51 minutes
Mountlake Terrace (2011)	Standard is 8 minutes; met 90 percent of the time.		
Lynnwood (2011)	4.63 minutes	5.22 minutes	Not applicable

[a] Jurisdictions use different names for these categories.

[3] All population figures are from Washington State Office of Financial Management.

Solid Waste and Recycling Services

In Seattle, the Seattle Solid Waste Utility, a division of Seattle Public Utilities, currently contracts with Waste Management, CleanScapes, SeaDruNar, and Allied. In Shoreline, curbside, multifamily, business garbage, and recycling pick-up is provided by CleanScapes. In Mountlake Terrace, residential and business waste and recycling pick-up is provided by Waste Management NW. In Lynnwood, the City does not provide garbage service and curbside pick-up. Residents and businesses may use private contractors or transport their own waste to transfer stations.

Schools

Twenty-three public and private schools are within 0.50 mile of the light rail alternatives (see Figures 4.4-2a, 4.4-2b, and 4.4-2c in Section 4.4, Social Impacts, Community Facilities, and Neighborhoods). Altogether, the schools serve approximately 28,000 students, almost two-thirds of whom (about 18,000) are enrolled in North Seattle Community College.

4.14.2 Long-Term Impacts

No Build Alternative

With continued population and employment growth and related increases in development, traffic, and other activities, there would be higher demands on all public services and safety and security with the No Build Alternative, including emergency services. Increased traffic congestion could affect emergency service response times.

Light Rail Alternatives

All alternatives have generally similar types of impacts on public services and safety and security. This subsection summarizes the impacts for all segments and alternatives jointly, and then briefly discusses the differences in impacts by alternative starting with the Preferred Alternative and then discussing how other alternatives differ.

Fire and Emergency Medical Services

All alternatives would run trains on an exclusive right-of-way. Because the right-of-way is not crossed by roads, sidewalks, or paths of any kind, accidental intrusions by people or vehicles onto the right-of-way are very unlikely, resulting in a very low potential for crashes.

Light rail trains would not cross surface streets at-grade; therefore, light rail operations at street crossings would not directly affect emergency and incident response routes or times. However, increased congestion at station areas and park-and-ride lots could affect response times. Chapter 3, Transportation Impacts and Mitigation, identifies locations where traffic congestion and delays would occur with

the light rail alternatives, and the associated mitigations; of these, Shoreline Fire Station No. 65 is discussed below.

All of the jurisdictions along the project corridor currently operate Emergency Vehicle Preemption (EVP) programs that give emergency vehicles priority. Sound Transit would work with the jurisdictions to anticipate the EVP programming needs around stations and to ensure that emergency response times would not be affected.

Service providers would need special training to respond to emergencies at light rail elevated guideway sections and stations. In general, it is slower and more difficult to access elevated sections in an emergency compared to at-grade sections, although at-grade locations may have access restrictions, such as where at-grade facilities are within WSDOT's right-of-way and immediately adjacent to active freeway lanes or shoulders. Several of the alternatives are within the freeway median (such as Alternative B1 or B4) or where the guideway crosses above traffic lanes (all alternatives in Segment B, and some options in Segment C). However, Sound Transit's design standards and operating procedures for light rail directly address emergency access needs for all types of facilities and alignments featured in the light rail alternatives.

Access plans for getting to the stations and guideway from I-5 will be developed in consultation with WSDOT, FHWA, and the affected agencies, and will include regular ongoing coordination with the service providers. No existing I-5 median emergency and law enforcement vehicle turnarounds will be removed.

In Segment A, Alternatives A5 and A7 would have unique impacts because they would place a station and park-and-ride lot adjacent to Shoreline Fire Department Station No. 65 that would alter traffic levels and construct new driveways and intersections adjacent to that fire station. The increase in traffic at the park-and-ride lot could slightly increase response times.

Access to fire hydrants, fire lanes, and access points within or adjacent to the project boundaries will be maintained where possible; where it is not possible, access will be redesigned in concert with the appropriate agencies and jurisdictions.

Project design will be in accordance with Link light rail design standards and in coordination with local jurisdictions and the Link Fire, Life, and Safety Committee. Sound Transit design standards require specific facilities and locations to allow emergency access throughout the light rail line and for evacuating passengers if needed. These standards include design requirements for lighting, unobstructed views, pedestrian safety, elevators and escalators, public plazas, patron information centers, public telephones, call-for-aid stations, emergency management panels, security cameras, vandalism deterrents, public address systems, radio communications, and alarms. They also include principles and guidelines designed to ensure safety and security throughout the light rail system.

Operationally, a Lynnwood Link Extension emergency response and safety and security plan will be developed and implemented and include training and equipment, as well as procedures for light rail construction and operation.

Law Enforcement

All alternatives would require police and security staff to monitor stations, parking facilities, and other areas to protect people and property. Sound Transit operates its own security force within its facilities.

Studies by Sound Transit, the City of Seattle, and others have consistently found that crime at transit facilities, such as stations, generally reflects the conditions in the surrounding neighborhoods. Quality-of-life crimes (for example, vandalism, drunkenness, and panhandling) and property crimes account for more than 90 percent of transit facility crimes. Violent crimes account for most of the remaining crimes. Crimes are more likely to occur at a station than on a light rail car. In addition, stations with park-and-ride lots have more potential for crime than stations without parking. Different types of station access (stairs, escalators, or elevators) do not appear to influence criminal activity, but their design and location can be a factor if they provide places where criminals can act without being observed by others.

The project's final designs will incorporate Crime Prevention Through Environmental Design principles. These principles, in association with other security features of the light rail system and the presence of security personnel, would deter criminal activity and generally make light rail stations and parking facilities safer and more secure.

As with fire and emergency services, because light rail trains would not cross surface streets at-grade, light rail operations at street crossings would not directly affect police response routes or times. However, increased congestion at station areas and park-and-ride lots could affect response times. Chapter 3, Transportation Impacts and Mitigation, identifies locations where traffic congestion and delays are predicted to occur with the light rail alternatives, and provides associated mitigation.

As with fire and medical emergencies, police access to the light rail trains would require additional planning for alternatives with an elevated guideway and stations, and for stations not easily accessible from the existing road network. This would occur with segments of the Preferred Alternative and all other alternatives.

Since events in 2001, terrorism has received heightened awareness, and federal legislation has given FTA a safety oversight role for transit systems. Many measures that address non-terrorism security and safety issues also address terrorism concerns. Sound Transit will continue to work with FTA, law enforcement agencies, the U.S. Department of Homeland Security, and emergency service

providers to develop strategies to prevent and respond to terrorist activities that could affect the proposed project.

Solid Waste

The Preferred Alternative and all other alternatives would not acquire or otherwise affect any property currently occupied by recycling, composting, and solid waste facilities or operating bases. Travel times or collection routes for these facilities would not be notably affected by the project.

Other Public Facilities

Neither the Preferred Alternative nor any other alternatives would acquire any property currently in active use as a school, post office, postal facility, or hospital. The project would acquire a portion or all of a parking lot at NE 185th and 5th Avenue NE on Shoreline School District property now in use as a conference and recreation center. In addition, the project would occupy a portion of Edmonds School District vacant properties; this would occur in Segment B with the 220th Street Station South Option in the Preferred Alternative, and in Segment C with all alternatives, but the property affected could still be developed. Section 4.1, Acquisitions, Displacements, and Relocations, identifies areas where the Preferred Alternative or other alternatives could affect parcels owned by the public school districts. No alternatives would notably affect the travel times or routes for school buses.

Current postal services or routes would not be notably affected by the project, and the project would not affect access to hospitals.

Lakeside School is close to the proposed NE 145th Street Station with the Preferred Alternative and Alternatives A1, A3, A10, and A11. It serves a widely dispersed student body, some of whom might arrive by light rail. Currently, students using public transit and walking to the school have routes with safety concerns, including incomplete sidewalk links. The light rail project would not introduce any new safety concerns, and it would upgrade street crossings and the intersection immediately adjacent to the station. Any other safety-related improvements (sidewalks and protected crossings) constructed to serve pedestrians accessing the new light rail station could also serve Lakeside students for parts of their routes to and from the station. While there are other schools near the proposed light rail alignment along I-5, no other schools are as close to a station alternative as Lakeside; see Figures 4.4-2a, 4.4-2b, and 4.4-2c in Section 4.4, Social Impacts, Community Facilities, and Neighborhoods.

4.14.3 Construction Impacts

Sound Transit would work with contractors, utility providers, Cities, WSDOT, and FHWA to minimize disruption to the transportation network; however, some disruption would still occur. Traffic rerouting, lane closures, and construction traffic

may affect emergency response times and the travel times or routes for public service vehicles during construction periods, especially at stations or construction sites. This could also require emergency responders to alter their response routes or it could increase their response times. The reconstruction or closure of I-5 overcrossings could require detours or increase delays.

Alternative A1 would rebuild the NE 117th Street overpass, which would affect access to Northgate Elementary School. The Preferred Alternative and Alternatives A1, A5, and A10 would rebuild the NE 130th Street overcrossing and northbound off-ramp. Alternative A1 would rebuild the NE 185th Street overcrossing. All Segment A alternatives would construct an elevated structure over NE 155th Street, which could cause temporary lane closures or delays at NE 155th Street, where a fire station is located and where the Shoreline Fire Department's only ladder truck is based. Any closures or delays would be temporary and of short duration as a single event, although these closures and delays may occur over several months. Still, this could affect response times and require detours, alternative routes, or other modified operations during the most active period of construction at the affected location.

The above impacts are limited to Segment A because the other light rail segments do not include major rebuilds of streets and bridges. Chapter 3, Transportation Impacts and Mitigation, identifies the locations where construction traffic changes are anticipated, and also describes the construction traffic mitigation measures that would be implemented to reduce impacts. Construction haul routes would primarily be on arterials and at freeway ramps and would not affect public service facilities, except at Shoreline's Fire Station No. 65, where plans would be developed to maintain emergency access and response times.

In Segments B and C, the Preferred Alternative could result in construction-related impacts to Edmonds School District property, such as the relocation of school buses that could use the Edmonds School District property in Segment C for parking during project construction.

4.14.4 Indirect and Cumulative Impacts

As described above for the No Build Alternative and light rail alternatives, the continued growth in population, employment, and general urban activity in the project area through 2040 would increase demand on public services, including emergency and public safety services. As described in Section 4.2, Land Use, and Section 4.3, Economics, population and employment growth consistent with regional and local comprehensive plans, the Lynnwood Link Extension, and other potential projects in the area, such as the proposed OMSF (if sited in Lynnwood) and the Edmonds School District master planned services center development, would cumulatively increase the level of development and public activity in station areas and increase the demand for public services within the project area. However, the

project's contribution to the potential increase in demand for public services would be minor, and the project's indirect and cumulative effects would not hinder service providers in delivering services.

4.14.5 Potential Mitigation Measures

Sound Transit would coordinate with the Shoreline Fire Department during final design to avoid construction impacts to Station No. 65, and to define measures to minimize impacts on response times and operations.

During final design and construction, Sound Transit would coordinate with the Edmonds School District to minimize property impacts on its properties in Segments B and C.

During construction, Sound Transit would provide regular updates to schools, emergency service providers, local agencies, and postal services. The agency would also assist public school officials in providing advance and ongoing notices to students and parents about construction activity near schools.

No other mitigation would be needed, given the project commitments to:

- Provide mitigation measures as identified in Chapter 3, Transportation Impacts and Mitigation, for long-term and construction impacts on traffic.
- Design the project in accordance with Link light rail's design standards that fully address emergency, safety, and security.
- Operate the light rail in accordance with Link light rail's existing approaches to ensure safety and security throughout the system.
- Develop emergency response and safety and security plans and programs in cooperation with WSDOT, FHWA, local jurisdictions, and affected agencies, including working with local emergency response providers to ensure they have the necessary equipment to access the guideway at all points along the route.

4.15 Utilities

This section analyzes the short-term construction and long-term operations impacts of the Lynnwood Link Extension on utility providers and systems that currently serve, or are planned to serve, the project area.

4.15.1 Affected Environment

The study area for this analysis extends 100 feet from the alternative alignments and stations. Utility providers within the project area include municipal agencies, public utility districts, and private companies. In addition to public or municipal utility providers, such as the cities with water or sewer utilities, there are electrical power, natural gas, water, sanitary sewer, stormwater, and telecommunications service

providers in the study area. The individual utilities are identified below in Section 4.15.2, Long-Term Impacts.

Sound Transit asked all the utility providers in the project area about any planned improvements that might affect or be affected by the light rail alternatives. Five of the future projects identified by providers in the project area are considered major utility projects (12-inch-diameter pipelines or larger for water, sewer, and stormwater). These five projects are the City of Shoreline's fish barrier removals west of I-5 near mile post 174.9, City of Mountlake Terrace's 24-inch-diameter stormwater line and 12-inch-diameter water line, Alderwood Water & Wastewater District's 20-inch-diameter water line, and Snohomish County PUD's electric power substation. Although the Snohomish County PUD's planned substation was initially identified as potentially within the Lynnwood Link Extension footprint, Sound Transit subsequently adjusted the design for the project to avoid this potential conflict.

4.15.2 Long-Term Impacts

No Build Alternative

Under the No Build Alternative, light rail would not be extended to Lynnwood. Without the light rail extension, direct impacts on utilities would be avoided.

All Light Rail Alternatives

All light rail alternatives in Segments A, B, and C would need to relocate existing utilities in order to avoid conflicts with utility infrastructure and operations. The potential for conflicts occurs wherever the alternative alignments and associated features would cross an existing utility such as electric lines, water mains, stormwater or sewer lines, natural gas lines, or telecommunications (cable and fiber optic) networks. Also, conflicts would occur where utilities are located parallel and in proximity to the alternatives. Table 4.15-1 shows the affected utilities by segment, and Table 4.15-2 shows the number of affected utilities. Appendix I-4.15, Utilities, has further details on the areas where potential major utility conflicts might occur. Through project design, conflicts would be addressed by avoiding the conflict or by relocating the utility; no long-term impacts are expected.

After the conflicting utilities are relocated, the project would not cause major disruptions in service to utility customers during light rail operations or maintenance along the guideway. In some cases, manholes, pipes, vaults, and other maintenance access points might also need to be permanently relocated to ensure that maintenance activities could be conducted without interrupting either light rail or utility service.

Sound Transit would work closely with WSDOT or utility providers during the design process to provide required access to facilities and any relocated manholes, vaults, utility mains, fire hydrants, and/or other features. Nearly all water, sewer, and

stormwater lines within the project footprint are 12 inches or more in diameter and all are considered major utilities. These major utility lines are either buried or hung from bridges. Consequently, except for the elevated guideway columns, there would be direct conflicts only where these utilities cross below at-grade sections of the light rail alignment. Major utility crossings have been flagged as potential conflicts, as shown in Table 4.15-1. During final design, additional coordination with the utility providers would confirm and resolve potential conflicts.

Table 4.15-1. Potential Conflicts with Existing Utilities in the Study Area

Jurisdiction and Segment	Utility	Provider	Number of Conflicts
Seattle	Gas	Puget Sound Energy	5
	Electricity	Seattle City Light	16
Segment A	Water	Seattle Public Utilities	1
	Wastewater	Seattle Public Utilities	1
	Stormwater	Seattle Public Utilities	2
	Cable	Comcast	2
	Communications	CenturyLink, Verizon, WSDOT, AT&T, Clearwire, T-Mobile	5

Table 4.15-2. Utility Conflict Summary: Crossings and Parallel Relocations

Segment/Alternative	Total Crossings	Linear Feet of Parallel Utilities
Segment A		
Preferred Alternative[a]	65	6,595
Alternative A1	30	3,000
Alternative A3	28	550
Alternative A5	29	2,850
Alternative A7	25	550
Alternative A10	28	2,850
Alternative A11	27	550
Segment B		
Preferred Alternative	25	1,695
Alternative B1	16	9,900
Alternative B2A	21	1,150
Alternative B4	23	9,900
Segment C		
Preferred Alternative	6	50
Alternative C1	12	2,400
Alternative C2	6	700
Alternative C3	11	0

[a] The Preferred Alternative utility information reflects additional design information needed to identify minor as well as major utilities and their relocation or avoidance requirements.

The light rail system would draw power from the regional electrical power grid. The alternatives would operate electric trains with up to four cars from existing 26-kilovolt (kV) and 12-kV primary electric distribution facilities. Sound Transit would locate traction power substations approximately every 1.5 miles along the project corridor to provide power to the overhead catenary system that powers the light rail vehicles. These substations would be powered by primary electric distribution lines connecting to the nearest existing power source, either overhead or underground. In some cases, the existing local network may be upgraded or new power lines constructed to transmit power to light rail substations. However, the power demands of the light rail system would not affect the ability of electrical utilities to meet the overall demand in their service areas.

Some utilities within or adjacent to the light rail facility footprint could be susceptible to stray currents. Without corrosion control measures, a portion of the electrical current flowing through the light rail trains could stray along conducting utility lines in the ground. These existing utilities will be carefully evaluated during design for possible effects from stray currents. Sound Transit will also coordinate the implementation of control measures with potentially affected utility providers.

These control measures could include the following:

- Installing cathodic protection systems
- Installing insulating unions to break the electrical conductivity of the utility
- Isolating electrical rails from the ground
- Installing stray-current-control track fastening systems to control stray current where appropriate

Most of the telecommunications, cable, and fiber optic facilities in the alternatives' footprint are identified as potential conflicts, and almost all are within the I-5 right-of-way or other public rights-of-way. Most private utilities within public rights-of-way are franchise holders (the utility has an agreement with the city government or WSDOT to use the public right-of-way) who must relocate their utilities at the City's or WSDOT's request, at their own expense. Sound Transit would work with the affected utilities on relocation, consistent with Sound Transit's design criteria, policies, and applicable laws and permits, including city codes and charter provisions.

To resolve conflicts with overhead power lines, some power poles would need to be relocated and/or raised. Typically, when an electric power transmission line is raised, it affects several power poles because power line elevation changes need to be spread out. For example, changes in height for a 115-kV transmission line may affect power poles, transmission line heights, and the supporting poles from 350 to 450 feet on either side of where the elevation changes are needed. There are approximately eight 115-kV transmission line crossings over the length of the Preferred Alternative, with seven additional power line crossings of lesser voltage. There will also be a need to relocate local primary distribution power lines that conflict with the guideway and stations, as well as the related reconstruction of surface streets. For the overhead primary power distribution lines crossing over the project and I-5, the overhead lines may need to be placed underground, instead of being raised, if the reach of the utility maintenance vehicles is too short.

Preferred Alternative

Table 4.15-3 lists overhead electrical line crossings for the Preferred Alternative. The largest change in an existing transmission line is expected in Lynnwood at 48th Avenue West. This is where the crossing of light rail with a transmission line along the Interurban Trail would relocate a portion of the transmission line and poles about 1,300 feet to the west and another portion about 900 feet to the east.

Table 4.15-3. Major Overhead Power Line Conflicts

Location	Type of Crossing	Utility	Proposed Action	Typical Runout[a] West	Typical Runout[a] East
NE 123rd Street/I-5	115-kV Transmission	SCL	Raise Pole	None	Yes
NE 155th Street/I-5	Distribution	SCL	Relocate and Raise Pole	Yes	Yes
NE 165th Street/I-5	115-kV Transmission/Distribution	SCL	Raise Pole	None	None
NE 167th Street/I-5	Distribution	SCL	No Action Required	None	None
NE 170th Street/I-5	Distribution	SCL	Raise Pole	None	None
NE 180th Street/I-5	Transmission/Distribution	SCL	Relocate and Raise Pole	None	Yes
NE 189th Street/I-5	Distribution	SCL	Raise Pole	None	Yes
NE 195th Street/I-5	115-kV Transmission	SCL	Raise Pole	None	None
NW 201st Street/I-5	115-kV Transmission	SCL	Raise Pole	Yes	Yes
NE 205th Street/Ballinger Way NE and I-5	115-kV Transmission/Distribution	SCL/PUD/PSE	Raise Pole	Yes	Yes
58th Avenue West/I-5	Distribution	PUD	Raise Pole	Yes	None
212th Street SW/I-5	115-kV Transmission/Distribution	PUD	Relocate and Raise Pole	None	None
52nd Avenue West/ I-5	115-kV Transmission/Distribution	PUD	Raise Pole	Yes	Yes
Interurban Trail/48th Avenue West	115-kV Transmission/Distribution	PUD	Relocate and Raise Pole	Yes	Yes
200th Street SW/44th Avenue West	Distribution	PUD	Underground	None	None

[a] Typical Runout: Horizontal distance and additional raised power poles required to allow elevated power lines to converge with existing adjacent non-elevated power lines.

SCL = Seattle City Light; PUD = Public Utility District; PSE = Puget Sound Energy

Segment A: Seattle to Shoreline

The Preferred Alternative's most common utility conflicts would involve overhead and underground power (27 conflicts). Others would be a 16-inch high-pressure gas main and two gas district regulators near NE 130th Street; a 24-inch water main at NE 185th Street; a 30-inch water main at NE 115th Street; and up to eight sewer systems (3,010 linear feet of parallel sewer lines). Ridgecrest Park would be affected by 250 linear feet of sewer replacement that is parallel and adjacent to Segment A on the west side of the park. The impacts would temporarily affect the existing landscaping berm and transitional areas (see Section 4.17, Parks and Recreational Resources, for more information about Ridgecrest Park).

Neither the NE 130th Street Station Option nor the NE 185th Street stadium parking garage option would alter the number of affected utilities.

Segment B: Shoreline to Mountlake Terrace

The Preferred Alternative has approximately 25 utility conflicts, including nine electric power conflicts. There are also sewer conflicts at and near the Mountlake Terrace Transit Center. There are seven telecommunications conflicts and two water conflicts; 1,695 linear feet of parallel utilities are in conflict. The major electric conflicts involve raising transmission lines at I-5 and NE 195th Street, raising transmission lines at I-5 and NE 201st Street, raising transmission lines at I-5 and NE 205th Street, raising distribution lines at I-5 and 58th Avenue West, and raising transmission lines at I-5 and 212th Street SW after first relocating a power pole that is in the path of the Preferred Alternative.

The Preferred Alternative's 220th Street Station Option would create three additional minor conflicts: telecommunication lines and cables for WSDOT's Illumination and Intelligent Transportation Systems.

Segment C: Mountlake Terrace to Lynnwood

The Preferred Alternative has six potential power line conflicts in Segment C along with 50 linear feet of parallel utility conflicts; power transmission poles and lines adjacent to the Interurban Trail would need to be raised. However, there would be no permanent effect on these utilities.

Other Light Rail Alternatives

The following discussion and Table I-4.15-1 in Appendix I-4.15, Utilities, indicate the relative differences among the alternatives by segment.

Segment A: Seattle to Shoreline

The other Segment A alternatives would have 25 to 30 potential utility conflicts; many of these involve overhead power lines. There are also potential gas line conflicts in Segment A with all the light rail alternatives. Other utilities of concern include a 30-inch-diameter Seattle Public Utilities water line crossing at North 115th Street and a 24-inch-diameter Shoreline Water District water line crossing at NE 185th Street. These crossings would be of heightened concern because of their large supply capacity and the large number of customers who would be affected if service were disrupted. The other conflicts would be with storm drains and communication lines.

The linear feet of parallel utilities vary by alternative in Segment A, depending on whether it is at-grade or elevated (conflicts with parallel utilities would be not only where they are along the alignment but also where they would be encountered at a similar grade or could restrict access). For example, there are 550 feet of parallel utilities within the footprints of the mostly elevated alternatives (A3, A7, and A11), but the mostly at-grade alternatives (A1, A5, and A10) would have approximately 3,000 linear feet of parallel utility conflicts.

Segment B: Shoreline to Mountlake Terrace

There are 16 to 23 potential utility conflicts in Segment B. Many of these conflicts would involve power lines, but there are also four potential gas line conflicts for all Segment B alternatives. Other conflicts would include water lines, one sewer line, storm drains, and communication lines.

The linear feet of parallel utilities vary considerably among the Segment B alternatives. The footprint of Alternative B2A would include only 1,350 linear feet of parallel utilities, but Alternative B4 would have more than eight times that amount.

Segment C: Mountlake Terrace to Lynnwood

Segment C utility conflicts would be from Snohomish County PUD power lines. Alternative C1 would have the greatest number of potential power line conflicts, both in terms of the number of crossings and in length of parallel construction conflicts. Alternative C2 would have approximately half as many potential power line conflicts as the two other Segment C alternatives. Alternative C3 would have nearly as many potential conflicts as Alternative C1, but no potential parallel conflicts. Alternative C3 would require relocating two large transmission poles and raising the Snohomish County PUD transmission lines, but they would remain within the PUD right-of-way, and the new poles would be outside the areas currently occupied by the Interurban Trail.

4.15.3 Construction Impacts

Construction impacts would occur when utilities are located along the project footprint (parallel impacts) or where utilities would intersect the light rail alignment. Impacts would be avoided or minimized by permanently or temporarily relocating the affected utilities during construction, by adjusting the light rail alignment during final design, or by protecting utilities from construction damage, in accordance with Sound Transit's *Link Design Criteria Manual* (Sound Transit 2013).

Underground utilities may need to be relocated because of impeded maintenance access, inadequate vertical clearance between the utility and the rail line (especially in cut sections), or structural impacts to the utility (both in cut sections and at-grade sections).

For elevated light rail guideways, impacts on underground utilities should be minimal, provided that the support columns could be located to provide adequate horizontal clearance between the utility and the support column. However, conflicts between elevated light rail guideways and overhead utilities could occur where elevated guideways either run directly underneath the utility lines or cross them. Also, utility lines may need to be raised to accommodate large construction equipment. These conflicts would be resolved by raising the lines over the overhead light rail catenary system at the utility's required minimum distance, in compliance

with the National Electrical Safety Code. Work plans would be submitted to the utility providers prior to construction. Sound Transit will replace existing utilities in-kind if Sound Transit funds the relocation.

Potential Service Disruptions

For the Preferred Alternative and other at-grade alternatives, high pressure gas mains on 5th Avenue NE just south of NE 130th Street would be relocated. Puget Sound Energy indicated that this relocation, which would temporarily reduce gas transmission capacity, should only occur during the summer when demand is lowest. Two Puget Sound Energy regulators at the southwest corner of 5th Avenue NE and NE 130th Street would also likely need to be relocated, as would a 6-inch intermediate pressure gas main on the NE 130th Street bridge, and a 6-inch intermediate pressure gas main along 5th Avenue NE, just north of NE 185th Street. Brief interruptions in service to customers would occur while service switches to temporary connections.

For all alternatives, brief water service outages would be required as water mains are switched over from existing systems to new or temporary facilities. The service outages would generally be a few hours to half a day. Customers would be given advanced warning of the shutdown well in advance of the shutdown. Affected areas would be limited to the immediate vicinity of the work.

At the bridge crossing at NE 185th Street, an existing 24-inch water main would be modified to accommodate changes to the bridge. The configuration of the valves in the vicinity of this work would not allow the work to be fully isolated from the adjacent systems. As a result, customers between 1st Avenue NE and I-5 and north of NE 185th Street would experience outages while the system is switched to a temporary line, and again when the system is switched back to the new permanent facilities.

Power and telecommunications (cable, telephone, fiber optic) service to customers in the vicinity of the project would be interrupted briefly as lines are adjusted to accommodate the light rail infrastructure. Final design and coordination of the construction would be completed by the respective utility source providers, and they would be responsible for maintaining service and notifying customers. In general, service outages would be brief and isolated to the immediate vicinity of the work sites.

4.15.4 Indirect and Cumulative Impacts

The availability of light rail service could encourage development of property near the project footprint, which in turn would increase the demand for utility services in this area. However, any development near the project footprint would be no more intense than what is allowed in the adopted land use plans of the local governments. Concurrent construction projects near the project could result in more utility relocations, which could increase the number of short-term service disruptions.

Potential concurrent projects are OMSF (Lynnwood site alternative) and the Edmonds School District master planned services center. See Section 4.2, Land Use, for more details on the indirect and cumulative impacts related to land use development.

4.15.5 Potential Mitigation Measures

All alternatives include design standards and BMPs to minimize impacts. These measures include coordination with utility providers and the public to minimize impacts on utilities during light rail construction and operation. If simultaneous projects in the vicinity of the Lynnwood Link Extension would have impacts on utilities, Sound Transit would coordinate with those projects to minimize additional service disruptions. Sound Transit would conduct potholing and preconstruction surveys to identify utility locations, including outreach to inform customers of potential service disruptions. Sound Transit would continue to work with utility providers to minimize any potential service interruptions.

In some cases, establishing temporary utility lines might be necessary during construction to ensure continuous service or to minimize service disruptions. In addition, Sound Transit and its contractors will follow safety protocols, especially when working near gas lines and power facilities, to protect the safety of construction workers.

With the implementation of design standards and BMPs, Sound Transit does not anticipate any adverse impacts on utilities during light rail operation; therefore, no additional mitigation is proposed.

4.16 Cultural, Archaeological, and Historic Resources

This section identifies and describes the historic properties in the vicinity of the Lynnwood Link Extension alternatives. Section 106 of the National Historic Preservation Act (NHPA) requires federal agencies to identify historic properties and to consider the potential project impacts on those historic properties. Regulations in 36 CFR 800 outline the process for complying with Section 106 requirements. Historic properties are defined in 36 CFR 800.16(l)(1) as "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior," and can also include traditional cultural properties.

Historic properties are identified and evaluated in consultation with the State Historic Preservation Officer (SHPO) at the Washington State Department of Archaeology and Historic Preservation (DAHP); tribes with jurisdiction or interest; local jurisdictions (Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood); and other consulting parties.

To be eligible for National Register of Historic Places (NRHP) listing, a historic resource must meet standards of integrity and at least one of the following criteria (36 CFR 60.4):

a) Is associated with an important event or series of events that have made a significant contribution to the broad patterns of American history; or

b) Is associated with an important individual who was significant in our past; or

c) Embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master or possesses high artistic values; or represents a significant and distinguishable entity whose components lack individual distinction.

d) Has yielded, or may be likely to yield, information important in history or prehistory.

Regulations in 36 CFR 800 outline the process for satisfying the Section 106 requirements. The process includes the following steps: (1) initiate consultation with regulatory agencies, tribes with jurisdiction or interest, local governments, and other interested parties; (2) define the Area of Potential Effects (APE); (3) identify, record, and evaluate resources for potential NRHP eligibility; (4) identify project effects; and (5) consult with affected parties to resolve adverse effects, if any, on historic properties.

A law known as Section 4(f) of the Department of Transportation Act provides further protection for historic properties that could be affected by a transportation project with FTA involvement; see Section 4.18, Section 4(f) and 6(f) Evaluation, for further details.

There are also state and local regulations that require consideration of cultural resources. SEPA and its implementing rules contained in WAC 197-11 require the identification of historic, archaeological, and cultural resources listed in national, state, or local registers, and the identification of measures to reduce or control effects on these resources. For listing in the Washington Heritage Register (RCW 27.34.200 and WAC 25-12), a property must typically be at least 50 years old, have a high-to-medium level of integrity, and have documented historic significance at the local, state, or federal level. Nine areas of significance are taken into consideration.

RCW 27.44 (Indian Graves and Records) protects Indian burials, while RCW 27.53 (Archaeological Sites and Resources) protects archaeological sites. RCW 76.09 (Confidentiality of Information) provides for the confidentiality of information on archaeological sites.

The Governor's Executive Order 05.05 addresses the need for state agencies to consult with Indian tribes in acquiring or developing land for capital improvements.

This analysis follows guidance provided by DAHP's *Washington State Standards for Cultural Resources Reporting*.

Three of the jurisdictions within the APE—Seattle, Shoreline, and Lynnwood—have a local preservation program with a board or commission that maintains a register of significant historic properties. The City of Shoreline's ordinance incorporates the King County preservation ordinance. The City of Mountlake Terrace has not adopted a preservation ordinance. The criteria for listing in local registers are generally similar to, but broader than, the NRHP criteria cited above.

The *Cultural, Archaeological, and Historic Resources Technical Report* provides detailed information on the historic, archaeological, and cultural resources discussed in this section. It also provides additional information about federal, state, and local regulations for protecting the resources.

4.16.1 Affected Environment

The APE for the Lynnwood Link Extension encompasses any historic, archaeological, and cultural property that could be directly or indirectly affected by construction or operation of the project. It includes all areas within 200 feet of the center of the light rail guideway, including at-grade or elevated profile sections, and within 200 feet of any station, parking structure, staging area, or other project facility. The vertical APE for archaeological resources includes all areas of ground disturbance associated with project construction. However, at this stage in the project, details regarding the depth of construction may vary by alternative and will continue to be developed as the project progresses through design.

Archaeological Resources

Archaeologists conducted a field survey in 2012, targeting locations within the APE that had some potential for having intact archaeological deposits. The project's Archaeological Work Plan (Appendix A of the *Cultural, Archaeological, and Historic Resources Technical Report*) describes the survey methods and the approach Sound Transit used to determine survey locations. The technical report also discusses the survey findings.

In recent decades, roadway construction and residential or other urban development have disturbed much of the study area; as a result, the overall APE has a low to moderate probability for intact archaeological remains.

Two historic-period archaeological sites (the Seattle–Everett Interurban Trail Segment site, 45SN531, and the Scriber Creek Park site, 45SN609) were identified during the archaeological investigation, but neither site retains integrity nor is considered historically or prehistorically significant. In consultation with the SHPO and affected tribes, FTA has determined these sites are not eligible for listing in the NRHP; the

SHPO concurred with these determinations on December 4, 2012. These sites are described in the *Cultural, Archaeological, and Historic Resources Technical Report*.

Traditional Cultural Properties

FTA and Sound Transit have consulted with the Muckleshoot Indian Tribe, Snoqualmie Indian Tribe, Stillaguamish Tribe of Indians, Suquamish Tribe, Tulalip Tribes of Washington, and Yakama Nation.[4] None of these parties has identified any potential for a traditional cultural property within the APE.

Historic Buildings and Structures

To identify potential historic properties within the APE, Sound Transit conducted a historic resources field survey. Every property within the APE that was built in or before 1970 was surveyed at an intensive level. While the standard NRHP age threshold is 50 years, Sound Transit used 1970 as the threshold year based on a conservative estimate of 2020 as the start of construction. Over 650 properties were surveyed.

Sound Transit also reviewed properties that are less than 50 years old but meet the age criteria for a local jurisdiction's preservation program. The agency coordinated with the Cities that have historic resource programs (Seattle, Shoreline, and Lynnwood) to identify any properties that were potentially eligible for their historic registers.

As a result of the historic resources field survey, FTA and Sound Transit determined that five historic resources within the APE retain a high level of integrity and meet NRHP eligibility criteria under Criterion C.[5] The SHPO concurred with these determinations on December 4, 2012.

In October 2013, after the publication of the Draft EIS, one of the NRHP-eligible resources, Melody Hill Elementary School, was demolished by its owner, Edmonds School District No. 15.

The remaining four NRHP-eligible buildings are located within Segment A, and are described in the following paragraphs. Table 4.16-1 lists these historic properties and Figure 4.16-1 displays them.

[4] Consistent with federal guidance, FTA and Sound Transit have also consulted with the potentially interested (although not federally recognized) Duwamish and Snohomish tribes.

[5] The NRHP-eligible resources are also considered Section 4(f) resources. Please see Section 4.18, Section 4(f) and 6(f) Evaluation, of this Final EIS for details on the project's 4(f) analysis.

Table 4.16-1. NRHP-eligible Resources within the Area of Potential Effects

Address	Description	Construction Date	Historic Status Eligibility
11200 1st Avenue NE, Seattle	Northgate Plaza Apartments	1950–51	Eligible NRHP Criterion C
11725 1st Avenue NE, Seattle	Northgate Elementary School	1956	Eligible NRHP Criterion C
13130 5th Avenue NE, Seattle	Parsonage	1928	Eligible NRHP Criterion C
132 NE 155th Street, Shoreline	Log House	1920	Eligible NRHP Criterion C

Northgate Plaza Apartments is a garden apartment complex with 207 units in 34 buildings. It was designed in 1950–51 by John Graham, Jr., the architect of nearby Northgate Mall, to help address the critical need for housing after World War II.

Northgate Elementary School (11725 1st Avenue NE, Seattle) was built in 1956 to accommodate post-World War II population growth in north Seattle. It was designed by Paul Thiry, one of Seattle's notable Modernist architects.

A residence at 13130 5th Avenue NE, Seattle, currently used as a parsonage by the North Seattle Church of the Nazarene, is a very good example of the Georgian Revival style, exhibiting an Italian Renaissance influence and an extensive use of terra cotta ornamentation.

The log house (132 NE 155th Street, Shoreline) is one of the oldest houses in the vicinity and is an example of a style that is very unusual in north King County.

In addition to being NRHP eligible, these properties are also eligible for listing in the Washington Heritage Register and for landmark designation in the cities of Seattle and Shoreline.

The historic resources survey identified one additional property that appears likely to meet the Seattle landmark designation standards: the Seattle Latvian Evangelical Lutheran Church (11710 3rd Avenue NE, Seattle). The property, built in 1971, does not yet meet the age criteria for the NRHP but does meet Seattle's 25-year threshold for landmarks. Only the Seattle Landmarks Preservation Board has the authority to determine if a property is eligible for designation. No other properties in the survey appear likely to meet local landmark criteria.

Only one previously identified historic resource is within the APE: a house at 727 NE 189th Street, Shoreline, which was identified in King County's Historic Resources Survey of Shoreline as meeting King County's and Shoreline's criteria for landmark designation. In consultation with the SHPO, this house has been determined to lack sufficient integrity to be eligible for NRHP listing.

Figure 4.16-1
National Register Eligible Properties within the APE

Lynnwood Link Extension

During consultation, the City of Lynnwood noted two buildings that have been altered and lack integrity, but have some historical importance to the City. The Cedar Valley Grange played an important role in the history of Lynnwood, serving as a community fixture. The City also noted that Hall's Lake is important to local history as the location of one of the area's first sawmills and an early church camp. The City also noted the Interurban Trail, which has been built on the former Interurban line right-of-way. The importance of the Interurban rail service is discussed in the *Cultural, Archaeological, and Historic Resources Technical Report*, but no visible evidence of the rail line remains.

4.16.2 Determination of No Adverse Effect

Under Section 106 regulations, an adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the NRHP in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Adverse effects include, but are not limited to, the following:

- Demolition or alteration of the property
- Alteration of the property's setting
- Introduction of visual, audible, or atmospheric elements that are out of character with the setting of the historic property
- Physical encroachment upon an archaeological site

An agency may make a finding of no adverse effect, in consultation with the SHPO, when the undertaking is modified or conditions are imposed to avoid adverse effects.

FTA and Sound Transit have determined that this project would have no adverse effects on historic properties. The SHPO concurred with this determination in a letter dated November 13, 2014. The SHPO's letter is attached to the *Cultural, Archaeological, and Historic Resources Technical Report*. The factors considered in determining the lack of effects to identified historic properties are described below.

No NRHP-eligible archaeological resources or traditional cultural properties have been identified; however, it is possible one or more archaeological sites exist beneath the ground surface in areas where project excavation would take place. Through the NEPA review and the Section 106 process, FTA and Sound Transit will continue to consult with the SHPO, tribes, and other interested parties to minimize impacts to a potential site, if found.

Long-Term Impacts

Long-term impacts are those that would occur or continue to occur while the proposed project is in operation. The impact would constitute an adverse effect if it, as described above, alters any of the characteristics that qualify the property for inclusion in the NRHP or local landmarks ordinances.

None of the light rail alternatives would adversely affect any of the NRHP-eligible historic properties within the APE, or have a long-term effect on any other potential landmark properties in Seattle, Shoreline or Lynnwood.

No Build Alternative

The No Build Alternative would have no long-term effects on historic properties.

Light Rail Alternatives

Segment A: Seattle to Shoreline

No alternative would affect historic properties during operation of the transportation facility. All of the historic properties are far enough from the transportation facility to preclude adverse vicinity impacts, such as noise, vibration, or visual effects. The new guideway would not alter or diminish the buildings' integrity of setting because the guideway would be constructed adjacent to I-5. I-5 has already altered the setting of nearby historic properties. Introduction of a new rail alignment next to I-5 would not further alter or diminish the integrity of those historic properties. None of the alternatives would alter or diminish the historic properties' remaining aspects of integrity: location, design, workmanship, feeling, or association.

The **Northgate Plaza Apartments** are located across the street from all the potential Segment A alternatives. This would cause a minor alteration of the apartments' integrity of setting, but because the new guideway is across the street, adjacent to I-5, the effect would not be adverse. There would be no other long-term alteration of the apartments' integrity of location, design, materials, workmanship, feeling, or association.

Northgate Elementary School is located west of I-5 and adjacent to the NE 117th Street overpass, which would be rebuilt under Alternative A1. This would not affect the historic property because the overpass would be replaced rather than newly located to the site. There would be no other long-term alteration to the building's integrity of location, design, setting, materials, workmanship, feeling, or association. All other Segment A alternatives are east of I-5 and would not affect this resource.

The **Parsonage** would be across I-5 from all alternatives. Alternatives A5, A7, A10, A11, and the Preferred Alternative with station option would include a station at NE 130th Street. This would cause a minor alteration to the Parsonage's integrity of setting and feeling, but because the new guideway and station are adjacent to I-5, these effects would not be adverse. No other aspect of integrity (location, design, materials, workmanship, or association) would be altered as a result of the station operation.

The **Log House** is located across the street from the proposed parking facility that would be constructed under Alternatives A5 and A7. All of the Segment A

alternatives would include a guideway west of the Log House. This would cause a minor alteration to the building's integrity of setting and feeling, but because the new guideway is adjacent to I-5 and the parking facility is across NE 155th Street and adjacent to the fire station, these effects would not be adverse. This project would not alter any other aspect of integrity (location, design, materials, workmanship, or association).

The project could affect the property owned by the **Seattle Latvian Evangelical Lutheran Church**, which is not NRHP eligible, but may meet Seattle Landmarks eligibility criteria. The Preferred Alternative and Alternatives A1, A5, and A10 would displace the residence (used as a caretaker's house) on the property, which has been determined to not be NRHP eligible, but the church buildings would be unaffected.

If the Seattle Landmarks Preservation Board were to designate the property as a Seattle Landmark, Sound Transit would seek a Certificate of Approval from the Board to undertake the necessary work on the site and would comply with the Board's requirements.

Segment B: Shoreline to Mountlake Terrace

None of the Segment B alternatives would affect historic properties because there are no historic properties within this segment of the APE.

The house at **727 NE 189th Street** is not NRHP eligible but is on the City of Shoreline's Historic Property Inventory; this property would also not be negatively affected by the project. It is located about 125 feet east of the guideway, which would run along the east side of I-5. The introduction of the new transportation facility would not alter or diminish the building's integrity of setting because the guideway would be constructed adjacent to I-5. I-5 has already altered and diminished the setting of nearby historic resources. Introduction of a new rail alignment adjacent to I-5 would not further alter or diminish the historic resource's remaining aspects of integrity: location, design, workmanship, feeling, or association.

Segment C: Mountlake Terrace to Lynnwood

None of the Segment C alternatives would affect historic properties because there are no historic properties within this segment of the APE. None of the Segment C alternatives would affect landmarks or locally significant resources in Lynnwood. All of the alternatives would be along the freeway as the edge of the Halls Lake property. Alternatives C1 and C2 would be elevated across the street from the Cedar Valley Grange and would not affect it.

Construction Impacts

Construction impacts such as noise, vibration, dust, or reduced access would be temporary and occur only during project construction. While they may temporarily disturb occupants, they would only be an adverse effect if they diminished the

qualities that make the property eligible for NRHP listing or local landmarks ordinances.

In order to reduce construction-related effects, Sound Transit will implement standard BMPs throughout the project construction period. Construction noise and vibration impacts are discussed in Section 4.7, Noise and Vibration.

Although Sound Transit has not identified significant archaeological resources in the project area and the corridor overall has a moderate-to-low probability for containing intact archaeological resources, construction activities involving excavation could encounter an unanticipated archaeological site. If the site is determined to be significant, an adverse effect could occur.

No Build Alternative

The No Build Alternative would have no construction-related effects on historic properties.

Light Rail Alternatives

Segment A: Seattle to Shoreline

The **Northgate Plaza Apartments** are located across the street from the potential alignment. All of the Segment A alternatives, including the Preferred Alternative, would involve guideway construction between the Northgate Plaza Apartments and I-5, which would have temporary minor effects, including noise, changed visual quality, and reduced access. These effects may temporarily alter the setting, but they would not permanently diminish any of the aspects of integrity (location, design, workmanship, materials, setting, feeling, and association); therefore, these effects are not considered adverse.

Northgate Elementary School would experience temporary, minor proximity effects from Alternative A1 during the rebuilding of the NE 117th Street overpass. These effects may include noise and visual intrusions. The setting may potentially be temporarily altered, but not diminished. No other Segment A alternative, including the Preferred Alternative, would affect this resource.

The **Parsonage** would experience temporary, minor proximity effects from the alternatives (Preferred Alternative with options, A5, A7, A10, and A11) during construction of the NE 130th Street Station. Construction impacts, such as noise, vibration, reduced access, or visual intrusions, could temporarily alter the integrity of setting and feeling of this historic resource. However, setting and feeling would not be permanently diminished, and these effects are not considered adverse. No other aspect of integrity (location, design, materials, workmanship, or association) would be altered.

The **Log House** would experience temporary, minor proximity effects from Alternatives A5 and A7 during construction of a parking facility across the street. Construction impacts, such as noise, vibration, reduced access, or visual intrusions, could temporarily alter the setting of this historic resource. However, setting and feeling would not be permanently diminished, and these effects are not considered adverse. No other aspect of integrity would be altered. No other Segment A alternative, including the Preferred Alternative, would affect this resource.

The **Seattle Latvian Evangelical Lutheran Church**, which is not NRHP eligible, but may meet Seattle Landmarks eligibility criteria, could have short-term restricted access during construction for all alternatives. Other construction impacts, such as construction traffic, visual changes and intrusions, noise and vibration, could also be nearby, but would not permanently alter the church structure.

Segment B: Shoreline to Mountlake Terrace

None of the Segment B alternatives, including the Preferred Alternative, would affect historic properties during construction because no historic properties are located within or adjacent to the proposed construction area.

Segment C: Mountlake Terrace to Lynnwood

No historic properties are located within or adjacent to the proposed construction area. None of the Segment C alternatives, including the Preferred Alternative, would affect landmarks or locally significant resources in Lynnwood. The properties of local significance (Hall's Lake and the Cedar Valley Grange) would have light rail nearby but would not be directly affected.

4.16.3 Indirect Impacts

Indirect impacts would be limited because there are so few historic properties in the project corridor.

4.16.4 Cumulative Impacts

Cumulative impacts would be limited because few historic properties exist in the project corridor; moreover, there are few pending projects involving construction or other developments that could affect historic resources in areas where the light rail project could also have effects.

4.16.5 Potential Mitigation Measures

Section 106 of the NHPA directs FTA, in consultation with the SHPO and other consulting parties, to develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on historic properties. Where adverse effects cannot be avoided, they will be resolved through

mitigation measures in a Memorandum of Agreement (MOA). Because there would be no adverse effects on NRHP-eligible historic properties, no MOA is anticipated for the Lynnwood Link Extension.

To minimize the risk of damage to currently unknown archaeological resources, Sound Transit would develop an Inadvertent Discovery Plan prior to ground-disturbing construction activities. FTA and Sound Transit would coordinate with the SHPO and tribes to review the plan. In addition, archaeologists would conduct training for contractors to help them identify potential archaeological remains during construction; the training would also cover protocols to implement if something is discovered.

If potentially significant archaeological materials or sites (or evidence thereof) are discovered during construction, activities would be halted around the find. All reasonable measures would be taken to avoid or minimize harm to the property until such time as FTA and Sound Transit, in consultation with the SHPO and the tribes, determine that appropriate measures have been taken to ensure that the project is in compliance with Section 106 of the NHPA.

The Inadvertent Discovery Plan also would describe the procedures that Sound Transit and FTA would follow if any human remains are discovered during project construction.

4.17 Parks and Recreational Resources

The parks and recreational resources considered in this section consist of designated public parks, designated open spaces, trails, and other publicly owned and publicly accessible lands that support recreational activities.

4.17.1 Affected Environment

The study area covers parks and recreational resources within 200 feet of potential light rail track alignments and 0.25 mile of potential station locations. Figures 4.17-1a and 4.17-1b map the parks and recreational resources in the study area. Table 4.17-1 summarizes the size, recreational use, location, and access for the resources.

In addition to the effects discussed in this section, impacts on parks and recreational resources are also evaluated under two federal statutes: Section 4(f) of the U.S. Department of Transportation Act of 1966, and Section 6(f) of the 1965 Land and Water Conservation Fund Act. These statutes require specific analysis of recreational resources, including avoidance or mitigation for certain direct impacts on some properties with parks and recreational uses. This analysis is provided in Section 4.18, Section 4(f) and Section 6(f) Evaluation.

Park and Recreational Facilities in the Study Area

Lynnwood Link Extension

Table 4.17-1. Parks and Recreational Resources in the Study Area

Park Facility	Size (acres)	Recreational Uses	Location of Recreational Uses Within Facility	Access Locations	Recreational or Open Space Values
Segment A					
Jackson Park Golf Course City of Seattle	160.38	Golf, walking trail	Throughout; trail facility along boundary.	NE 135th Street	Golf, scenic setting, mature conifers.
Thornton Creek Park #1 City of Seattle	7.8	None	Not applicable (N/A)	N/A	Scenic natural setting.
Northacres Park City of Seattle	20.67	Baseball, softball, soccer, nature trails, off-leash dog area, children's playground.	Throughout	1st Avenue NE	Active recreational facilities, off-leash dog area, large mature forest.
Twin Ponds Park City of Shoreline	21.96	Soccer, tennis, nature viewing, trails, playground.	Throughout; developed recreation located at the east side of park.	1st Avenue NE	Ponds and wildlife viewing access.
Ridgecrest Park City of Shoreline	3.82	Baseball diamond, handball, open grass.	Baseball diamond is nearest the proposed light rail route; handball is located on the east side of the park.	NE 161st Street	None
Seattle City Light Power Line Corridor	2.21	Open space.	Throughout	NE 185th Street, NE 188th Street	None
Shoreline Park and Stadium City of Shoreline	39.62	Football/soccer/track and field stadium, tennis, indoor swimming pool, grass fields, field turf soccer fields, forested trails.	The stadium is located nearest the potential light rail development; other uses are farther to the west.	Primary from 1st Avenue NE, secondary access from NE 185th Street	One of the few venues for large-scale track and field meets in the region; stadium seating for football, track, and soccer events.
Segment B					
Interurban Trail to Burke-Gilman Trail Connector City of Shoreline	(planned)	Planned signed bicycle and trail route connecting Interurban and Burke-Gilman trails.	Follows NE 195th Street to the Burke-Gilman Trail at NE 170th Street in Lake Forest Park; uses existing bridge crossing over I-5.	Part of street system	Urban street
North City Park City of Shoreline	3.96	Forest trails; adjacent school property is open to the public for soccer and playground use.	The forested section of North City Park extends east from the I-5 right-of-way.	10th Avenue NE	Mature Pacific Northwest forest.
Veterans Memorial Park City of Mountlake Terrace	10	Forested walking trails, gazebo, picnicking.	Throughout	232nd Street SW and 58th Avenue West	Mature Pacific Northwest forest; Veterans Memorial installation.
Jack Long Park City of Mountlake Terrace	3	Nature trails, picnicking, horseshoes.	Throughout	58th Avenue West	Mature conifers.

Table 4.17-1. Parks and Recreational Resources in the Study Area

Park Facility	Size (acres)	Recreational Uses	Location of Recreational Uses Within Facility	Access Locations	Recreational or Open Space Values
Segment C					
Interurban Trail City of Lynnwood	N/A	Walking, running, bicycling, skating.	Entire facility	Several street crossings; existing park-and-ride	Long-distance recreational trail.
Scriber Creek Trail City of Lynnwood	N/A	Walking, running, nature viewing.	Throughout	Scriber Creek Park and Lynnwood Park-and-Ride	Nature viewing.
Scriber Creek Park City of Lynnwood	4.59	Nature park with parking, picnicking area, short loop nature trail in the north section of the park and Scriber Creek Trail section to the south.	Picnicking and short loop trail in the northernmost section of the park; wetland trail to the south.	Cedar Valley Road, additional pedestrian access from 48th Avenue West	Mature conifers, natural character, wetland boardwalk, and trail.

Segment A

Jackson Park Golf Course, Seattle

Jackson Park Golf Course is a 27-hole golf course owned by the City of Seattle and managed by a private company. This golf course, which opened in 1930, is characterized by mature conifers and rolling topography. A public walking trail is located near the boundary of the course. In some locations the trail is a soft-surface walking path; in other locations it is a sidewalk.

Thornton Creek Park #1, Seattle

The undeveloped Thornton Creek Park #1 open space consists of riparian forest along the banks of Thornton Creek. There are a few unofficial trails in this park, but otherwise the open space does not accommodate recreational use.

Northacres Park, Seattle

Northacres Park is a large open space that provides baseball, softball, and soccer fields for active recreation, as well as nature trails, play areas, an off-leash dog area, and undeveloped open space for more passive recreation. The children's play area includes a wading pool.

Twin Ponds Park, Shoreline

Twin Ponds Park includes an artificial turf soccer field, children's playground, tennis court, nature trails, and a viewing deck for its namesake ponds.

Ridgecrest Park, Shoreline

Ridgecrest Park features a baseball diamond and a concrete handball court, as well as a grassy outfield/open space area. It has a small parking lot in the southwest corner. Although this park is located just east of I-5, a berm planted with mature cottonwood trees buffers the park from the freeway.

Shoreline Park and Stadium, Shoreline

This recreational complex includes Shoreline Park, Shoreline Stadium, and the Shoreline Pool. Shoreline Park includes tennis courts and two artificial turf soccer fields as well as a small forested area with walking paths. Recreational facilities on a portion of the site owned by the Shoreline School District include an undeveloped grass field and the Shoreline Stadium. The grass field is used for track and field events and informal recreation. The Shoreline Stadium includes an artificial turf football/soccer field as well as track and field facilities. It has a covered grandstand, and hosts large regional high school sports competitions, including an annual invitational track meet as well as football games, track meets, and soccer games. The recreational facilities associated with the Shoreline Stadium are open for public use.

Seattle City Light Power Line Corridor

Between North 185th Street and North 188th Street, Seattle City Light maintains a power line corridor as a grassy open space. A few informal trails cross the corridor. This corridor has no developed facilities, and the prominent overhead power lines reduce the aesthetic quality of the open space.

Segment B

Interurban Trail to Burke-Gilman Trail Connector, Shoreline

This planned route will connect the Interurban Trail and the Burke-Gilman Trail along North/NE 195th Street and NE 170th Street in Lake Forest Park. The route includes the existing pedestrian bridge over I-5 at NE 195th Street. According to the City of Shoreline, this route is primarily a transportation facility that can support recreational activities; impacts on the connector as a transportation facility are discussed in Chapter 3, Transportation Impacts and Mitigation.

North City Park, Shoreline

This small park includes a patch of remnant conifer forest with nature trails. The park is adjacent to a school play area and provides public access to this area, including a grass soccer field and children's play structures. The school's play area is adjacent to I-5 on the east side of the freeway and is buffered from the freeway by a wide stand of mature mixed forest.

Veterans Memorial Park, Mountlake Terrace

Veterans Memorial Park, located just northeast of the Mountlake Terrace Town Center, is a forested park offering nature trails, a gazebo, picnicking, and a children's play area. It also includes a flagpole and plaque as a memorial to veterans.

Jack Long Park, Mountlake Terrace

This small park east of I-5 is located adjacent to the Mountlake Terrace water towers. Its most significant feature is a patch of mature conifers. Recreational facilities include a nature walk trail, picnic tables, a small climbing rock, and horseshoe pits.

Segment C

Interurban Trail, Lynnwood

The Interurban Trail is a regional, multipurpose trail that spans several local jurisdictions. The segment of the trail in the study area is managed by the City of Lynnwood and includes segments on Snohomish County PUD right-of-way, as well as a side-path adjacent to city streets. North of the Lynnwood Park-and-Ride the trail continues adjacent to the I-5 right-of-way.

Scriber Creek Park, Lynnwood

This small park includes a parking area, picnic tables, a grassy area for passive recreation, and a short trail through mature conifers. It includes an open-water pond that is part of a larger wetland extending southward beyond the park property. A trail on the south end of the park (Scriber Creek Trail, described in the following paragraph) provides recreational access to the wetland within the park and expansive views over the larger wetland outside the park. This park was developed with bond funding from Snohomish County, which came with restrictions on how land could be converted to other uses.

Scriber Creek Trail, Lynnwood

Scriber Creek Trail connects Scriber Lake Park with Scriber Creek Park and the Interurban Trail. It enters Scriber Creek Park from Cedar Valley Road, extends southward to the park's boundary at a large wetland, then turns eastward to the edge of the Lynnwood Park-and-Ride and follows the boundary of the park-and-ride southeast, eventually connecting with the Interurban Trail.

4.17.2 Long-Term Impacts

Long-term impacts typically include permanent changes to a resource, such as when a project converts land from a park or recreational resource to another use. Indirect long-term impacts (discussed in Section 4.17.4) include changes to the area surrounding the park or recreational resource that would affect recreational opportunities or the recreational experience. While long-term impacts generally refer to permanent changes,

some construction impacts can be considered long term if they would have a major effect on the resource and extend for years.

Table 4.17-2 summarizes the long-term impacts that would affect parks and recreational resources in Segment A, where the highest number of resources would be encountered. The impacts in all three segments are described below.

No Build Alternative

The No Build Alternative would not affect parks and recreational resources.

Segment A Alternatives

Jackson Park Golf Course

Near the Jackson Park Golf Course, the Preferred Alternative transitions to an elevated guideway, with an above-grade station north of NE 145th Street and a multi-story parking garage. Portions of the guideway, the station, and the parking structure would be visible from some playing areas of the golf course and from parts of the walking trail along the boundary of the course. The light rail facilities would be most visible from the section of trail along 5th Avenue NE. The visibility of the guideway and station would not affect public use of the golf course or trail but would change some of the views.

For the other alternatives, portions of the guideway would also be visible from within the park, with the mostly elevated alternatives being more visible (A3, A7, and A11). Alternatives A1 and A10 would have similar visual impacts as the Preferred Alternative. For more discussion of this impact on views, see Section 4.5, Visual and Aesthetic Resources. Visual simulations from selected viewpoints within Jackson Park are provided in Appendix G, Visual Simulations and Illustrations (Viewpoint 10).

Thornton Creek Park #1

The project would have no long-term impacts on Thornton Creek Park #1.

Northacres Park

The project would have no long-term impacts on Northacres Park.

Twin Ponds Park

The project would have no long-term impacts on Twin Ponds Park.

Table 4.17-2. Long-Term Impacts, Segment A

Park Facility	Preferred Alternative	Alternative A1	Alternative A3	Alternative A5	Alternative A7	Alternative A10	Alternative A11
Jackson Park Golf Course	No property impacts, but areas with vegetation removal and an elevated NE 145th Street Station would be visible from parts of the golf course and walking trail.	Same as the Preferred Alternative.	Similar to the Preferred Alternative, but elevated guideway more visible.	Visual impacts from vegetation removal only.	Visual impacts from guideway only.	Same as the Preferred Alternative.	Same as the Preferred Alternative.
Thornton Creek Park #1	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.
Northacres Park	No anticipated impacts for the NE 145th Street Station Option. The NE 130th Street Station Option would provide improved access to the park; however, restrictions on parking would be needed to discourage use of the parking lot by transit patrons.	No anticipated impacts.	No anticipated impacts.	NE 130th Street light rail station would provide improved access to the park. Restrictions on parking would be needed to discourage use of the parking lot by transit patrons.	Same as Alternative A5.	Same as Alternative A5.	Same as Alternative A5.
Twin Ponds Park	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.	NE 155th Street light rail station would provide improved access to the park. Possible unintended use of parking lot may occur as informal parking for light rail patrons. Restrictions on parking would be needed to discourage use of parking lot for transit patrons.	Same as Alternative A5.	No anticipated impacts.	No anticipated impacts.
Ridgecrest Park	The light rail facility would occupy approximately 0.30 acre at the western edge of the park, removing a berm and trees that provide a buffer to I-5. Sound Transit would provide replacement parkland to the south.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.

Table 4.17-2. Long-Term Impacts, Segment A

Park Facility	Preferred Alternative	Alternative A1	Alternative A3	Alternative A5	Alternative A7	Alternative A10	Alternative A11
Shoreline Park and Stadium	The NE 185th Street Station would relocate a local street, affecting 0.18 acre of the Shoreline Stadium property (part of the existing surface parking lot, and the edge of the track and field facility). An option would locate the garage in the existing parking area.	Relocated local road would require use of 0.18 acre of the parking lot and stadium field for Shoreline Stadium. Impacts would include reduced parking spaces.	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.	No anticipated impacts.
Seattle City Light Power Line Corridor	Potential minor additional use of informal trail to access light rail station.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Portion of the open space replaced with parking for light rail station.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.

Ridgecrest Park

The Preferred Alternative would occupy a portion of the park's western edge for the light rail right-of-way. It requires realigning 1st Avenue NE, which offers an opportunity to create replacement parkland to the south to offset the park impact. The total park impact area would be approximately 0.30 acre. This area is adjacent to parking on the south side of the park and to the baseball diamond on the north side. The light rail facility would partially replace a berm and row of mature cottonwoods that currently buffer the park from I-5. A portion of the berm and existing trees may be retained at the northern edge of the park, depending on the final design of the light rail facility.

Figure 4.17-2 shows the area that would be affected within the park. The light rail guideway would be in a retained cut through this area, although the tracks would be close to existing grade. The anticipated impacts would not reduce parking or affect use of the baseball diamond, handball court, or grassy play area. The Preferred Alternative would have a berm, landscaping, or other barriers between the light rail facility and the park to replace the noise reduction and visual screening functions of the affected berm (see Viewpoints 21 and 22 in Appendix G). Also, to replace the property impacted by the light rail facility, property to the south of the existing park would be added to the park, and typical park features such as parking and landscaping would be developed; see Figure 4.17-2 for the proposed mitigation area.

The other Segment A alternatives would have similar impacts as the Preferred Alternative; similar replacement land and other mitigation have been included in those alternatives.

Shoreline Park and Stadium

The Preferred Alternative station at NE 185th Street would realign 5th Avenue NE, requiring retaining walls along the edge of Shoreline Stadium's parking lot and into part of a spur to the running track. About 10 of the 73 parking spaces in the existing parking lot would be affected. These changes within the stadium property would not permanently interfere with sporting activities at the facility or with the stadium's operations. The total impact area, including both parking and field impacts, would be approximately 0.18 acre, and is shown in Figure 4.17-3.

An option to the Preferred Alternative is to locate a five-story parking structure on the stadium's existing surface parking area (Figure 4.17-4). The parking garage would replace the surface spaces of the existing lot. During non-peak transit periods (after evening peak travel and on weekends), additional spaces would be available for stadium users. The parking garage could be seen from the stands and active sports areas, but would not affect user experience or function of the facility.

Shoreline Stadium Potential Impacts With Preferred Alternative and Alternative A1

Lynnwood Link Extension

Path: P:\3164 SoundTransit\LynnwoodLink\FEIS\PH Parks\Fig4.17-4 LL FEIS Park Detail Stadium.mxd

Data Sources: (King County, Snohomish County, WSDOT, Sound Transit, Bing Aerial)

Area of Affected Park and Recreation Facility

Area of Impact for the Preferred Alternative Option

Figure 4.17-4
Shoreline Stadium Potential Impacts With Preferred Alternative Option

Alternative A1 would have similar impacts to the Preferred Alternative because it would realign 5th Avenue NE to accommodate the parking garage on the west side of I-5. The other Segment A alternatives would place both the parking and the station on the east side of I-5, which would not have any impacts on the stadium.

Seattle City Light Power Line Corridor

Alternative A5 would convert part of the corridor's open space to use as parking areas for the NE 185th Street Station. No other Segment A alternatives would affect this power line corridor.

Segment B Alternatives

Interurban Trail to Burke-Gilman Trail Connector

All alternatives would rebuild the WSDOT bridge that crosses I-5 at NE 195th Street, which is a link in the trail system. The replacement bridge would continue to connect the trails.

North City Park

All alternatives would narrow the forested buffer between North City Park and I-5, but the light rail facility would not be visible from the park. No direct impacts to park property are anticipated.

Veterans Memorial Park

The Preferred Alternative would have no long-term impacts on Veterans Memorial Park. Alternative B1 has an option for a parking garage on what is now surface parking, in an area that borders the park, but does not physically alter the park or trail.

Jack Long Park

The project would have no long-term impacts on Jack Long Park.

Segment C Alternatives

Interurban Trail

All alternatives cross over the Interurban Trail. In all cases, the light rail facility would be elevated over the trail and would not interfere with its use or maintenance. Figure 4.17-5 shows where each alternative crosses the Interurban Trail and the Scriber Creek Trail.

The Preferred Alternative would cross over the Interurban Trail as it passes through an open field and wetland area south of Scriber Creek (see Viewpoint 48 in Appendix G). Several power line poles alongside the trail would be relocated. The light rail guideway would be prominent from the trail, but would not affect the use of the trail for recreation or commuting purposes. Because the trail is already in a visually complex urban setting, the light rail crossing overhead would have a minor impact on the trail character.

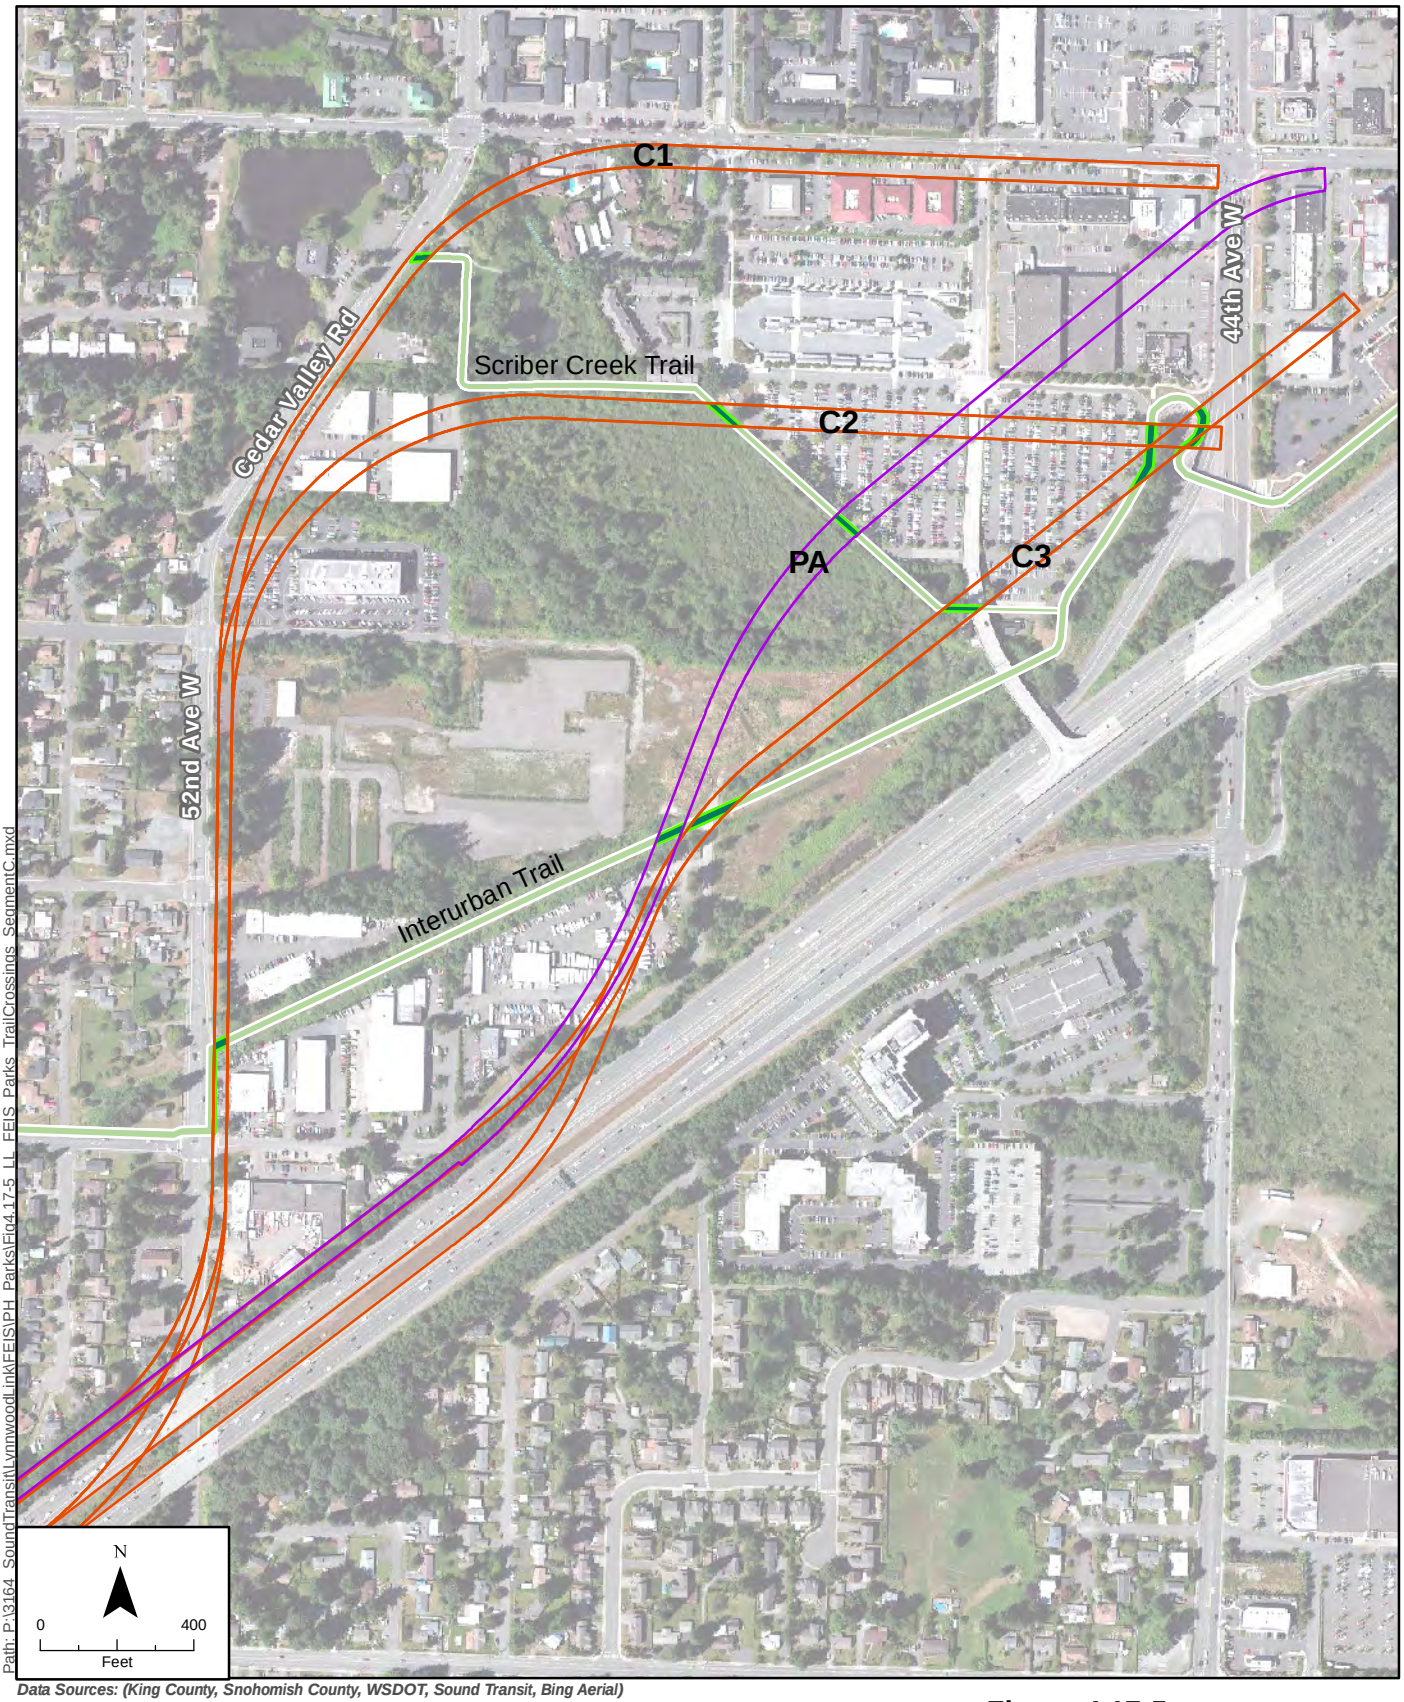

Figure 4.17-5
Segment C Trail Overcrossings

Alternative Footprint
Preferred Alternative
Potential Trail Overcrossing
Trail

Under Alternatives C1 and C2, the guideway would cross over the trail just east of 52nd Avenue West. The elevated tracks would also be located directly east of the trail for approximately half a block extending north from 208th Street SW. The light rail facility would be prominent for trail users; however, the trail is already in a visually complex urban setting in this location and the light rail facility would have a negligible impact on its use and enjoyment.

Under Alternative C2, the tail tracks would extend above the trail near 202nd Street SW as the trail slopes upward to the 44th Avenue West overcrossing.

Under Alternative C3, the elevated guideway would be similar to the Preferred Alternative but cross the trail about 50 feet to the south (see Viewpoint 43 in Appendix G). After crossing the trail, it would then travel northeast, roughly parallel to the trail for about 400 feet, until it crosses the trail again at the ramp leading to the 44th Avenue West overcrossing. An existing set of power line poles alongside the trail would be relocated. The light rail guideway would alter the quality of the views from the trail, but would not affect the use of the trail for recreation or commuting purposes.

Scriber Creek Park

The Preferred Alternative would cross to the Lynnwood Transit Center about 1,000 feet southeast of Scriber Creek Park. Elevated tracks would be visible in the distance, but would be partly screened by vegetation and would be difficult to distinguish from I-5 and the existing HOV direct access ramps, which characterize the more distant views.

Under Alternative C1, an elevated portion of the light rail route would pass above the Scriber Creek Park's entrance road and parking lot. Support columns would be located within the park property, and would directly affect approximately 0.42 acre of the park. The elevated guideway would be a prominent feature of the parking area, crossing directly overhead and changing the experience of the parking lot, which is currently buffered from the surrounding street and neighborhoods by established vegetation. The light rail facility would be visible from the short nature trail and picnic areas in the park but would not be as prominent as it would be from the parking area, and would not restrict recreational activities inside the park. While mitigation or other design measures could reduce impacts, Alternative C1 would still modify the character of the park by introducing larger-scale transportation infrastructure within the park. Public comments on the Draft EIS consistently described the natural setting of the park as a key part of its character. Figure 4.17-6 shows the area within the park anticipated to be used for the project right-of-way. Also, see Viewpoints 43 and 44 in Appendix G.

Path: P:\3164_SoundTransit\LynnwoodLink\FEIS\PH_Parks\Fig4.17-5_LL_FEIS_Park_Detail_ScriberCreek.mxd

Data Sources: (King County, Snohomish County, WSDOT, Sound Transit, Bing Aerial)

Potentially Affected Park and Recreation Facility
Potential Impact
Potentially Impacted Taxlot

Figure 4.17-6
Scriber Creek Potential Impacts

Under Alternative C2, an elevated guideway would pass over a wetland area adjacent to and south of the park and be visible from the segment of Scriber Creek Trail located in this area of the park, as shown in Figure 4.17-4 and Viewpoints 41 and 42 in Appendix G. Although the park would not experience direct property impacts, the light rail would be a prominent part of the view from the trail and would change the experience of this area of the park, which is focused on the natural wetland area. Enjoyment of some activities in the park, including wildlife watching and enjoyment of the natural environment of the adjacent wetland, could be diminished by the proximity of the elevated structure.

The project includes noise walls to mitigate noise impacts at nearby residences, which would also minimize noise increases in the park. Support columns, the elevated guideway, and the presence of passing trains would change the natural character of the wetland view from the park. Without mitigation, Alternative C2 would reduce the natural character of the park setting and user experience.

Alternative C3 would be about 1,100 feet southeast of the park. While the elevated light rail guideway would be visible from a park trail at the southeast edge of the park, it would be a distant view, similar to that of the Preferred Alternative.

Scriber Creek Trail

Each Segment C alternative includes an overcrossing of the Scriber Creek Trail, and effects would be similar to those described above for the Interurban Trail. The overcrossing would change the visual character of the trail in that location but not affect trail use.

With the Preferred Alternative, the elevated light rail guideway would cross over the Scriber Creek Trail on the southwest side of the park-and-ride. Views of the wetlands associated with Scriber Creek would not be obstructed.

Under Alternative C1, the light rail would cross the trail inside Scriber Creek Park where the trail is adjacent to the park's parking area, near 52nd Avenue West.

Under Alternative C2, the light rail would cross the trail as it follows the edge of the Lynnwood Park-and-Ride near 48th Avenue West. The elevated guideway would be adjacent to the trail for approximately 500 feet, including the portion of the trail on the southern boundary of Scriber Creek Park and its extension to 48th Avenue West. This section of the trail is alongside the Scriber Creek wetland.

Under Alternative C3, the location and character of the overcrossing would be farther south, closer to the HOV ramp to I-5, but its effects would be similar to that of the Preferred Alternative.

4.17.3 Construction Impacts

For parks and trails near construction activities, access could be affected by detours and street or lane closures, and by increased congestion caused by construction traffic. Visual impacts, light, glare, dust, and noise could also affect users in some of the parks and trails, although most of these impacts would affect small portions of the parks closest to the light rail facilities being constructed. Visual and noise impacts would be temporary and would not inhibit park use. The parks and recreational facilities with direct physical impacts from one or more of the alternatives (Ridgecrest Park, Shoreline Park and Stadium, and Scriber Creek Park) could have areas that are temporarily affected to allow construction access, staging, utility relocation, or other construction activities.

All alternatives would require temporary trail closures and detours. In Segment A, the Preferred Alternative and other alternatives would close a bridge that is related to the planned Interurban Trail to Burke-Gilman Trail connector, because WSDOT's existing pedestrian bridge crossing I-5 at NE 195th Street would be rebuilt. A detour to either NE 185th Street or NE 205th Street/Ballinger Way NE would be available during construction.

All alternatives would cross the Interurban Trail near the Lynnwood Transit Center. Work above or adjacent to the trail would involve short-term delays or longer, but temporary closures and detours would occur depending on the work involved.

The Preferred Alternative and Alternatives C2 and C3 would temporarily close a segment of the Scriber Creek Trail adjacent to the park-and-ride during construction, but detours would maintain connections to Scriber Creek Park and the Interurban Trail.

Tables 4.17-3 through 4.17-5 summarize the construction impacts for all light rail alternatives by segment.

4.17.4 Indirect and Secondary Impacts

The Lynnwood Link Extension could improve access to parks and recreational facilities. The facilities may experience increased congestion and unplanned parking, requiring cities in the affected areas to restrict parking to park and recreational users.

In Segment A, the Shoreline Park and Shoreline Stadium could be affected by unauthorized transit patron parking as well as increased roadway congestion under all alternatives. Although there are no current plans for redevelopment of the complex, which is school district property, the light rail station could increase the potential for redevelopment.

Table 4.17-3. Potential Construction Impacts, Segment A

Park Facility	Preferred Alternative	Alternative A1	Alternative A3	Alternative A5	Alternative A7	Alternative A10	Alternative A11
Jackson Park Golf Course	Noise and minor visual impacts from construction of facility along 5th Avenue NE, and from construction of NE 145th Street Station.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.
Ridgecrest Park	Light rail facility and a relocated underground sewer line would be located on western part of the park, replacing existing buffer; park would have noise and visual impacts during construction.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.
Shoreline Park and Stadium	Noise and visual impacts during construction. Parking restrictions to stadium. Short-term closures of parts of the track and field areas. An option with a parking garage would temporarily close the parking area, but alternative parking locations would be available.	Same as the Preferred Alternative.	No impacts.	No impacts.	No impacts.	No impacts.	No impacts.
Interurban Trail to Burke-Gilman Trail Connector (planned)	Temporary closure for replacement of NE 195th Street pedestrian bridge.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.

Table 4.17-4. Potential Construction Impacts, Segment B

Park Facility	Preferred Alternative	Alternative B1	Alternative B2A	Alternative B4
North City Park	Noise and screened views of construction activities.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.
Veterans Memorial Park	Alteration of transit center sidewalks connecting to a park trail, but the park would remain accessible.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	No impacts.

Table 4.17-5. Potential Construction Impacts, Segment C

Park Facility	Preferred Alternative	Alternative C1	Alternative C2	Alternative C3
Interurban Trail	Short-term closures with detours during construction.	Same as the Preferred Alternative.	Same as the Preferred Alternative.	Same as the Preferred Alternative.
Scriber Creek Park	Minor visual impacts on the wetland boardwalk area of the park.	Short-term partial closure of the park during construction. Visual and noise impacts.	Noise and visual impacts during construction activities.	Same as the Preferred Alternative.
Scriber Creek Trail	Detour around temporary closure of the section of the trail on sidewalks connecting Scriber Creek Park and the Interurban Trail.	Detour during a short-term closure of trail entrance to Scriber Creek Park.	Short-term closure during construction of elevated guideway.	Same as the Preferred Alternative.

At Northacres Park, light rail alternatives that include a light rail station at NE 130th Street (Alternatives A5, A7, A10, and A11) would have potential indirect effects on the park. The light rail station would improve access to the park, which could increase use of park facilities. The park may also be used as a pedestrian or bicycle route for neighborhood residents using the light rail facility. Its parking area could also be used for parking by light rail users, reducing the capacity for park users.

For Twin Ponds Park, the light rail alternatives that include a light rail station at NE 155th Street (Alternatives A5 and A7) would have effects similar to those described above for Northacres Park.

In Segment B, Veterans Memorial Park could benefit from higher levels of use due to increased development in the areas targeted by the City of Mountlake Terrace for transit-oriented development. Apart from the Lynnwood Link Extension, an improved pedestrian connection could be developed by others between the Mountlake Terrace Town Center and the station. This could increase the number of users in the park. The Veterans Memorial Park trail also could experience increased use from commuters accessing the station area. This effect would occur with all Segment B alternatives.

In Segment C, Scriber Creek Park and Scriber Creek Trail could have increased use due to high levels of development in the station area. Several properties adjacent to the park and trail could be developed to higher levels. The Interurban Trail also could experience increased use from commuters accessing the station area.

4.17.5 Cumulative Impacts

The proposed OMSF, if sited in Lynnwood, would be adjacent to the southwest corner of Scriber Creek Park and the Scriber Creek Trail. While the light rail facility would not occupy park property, it would be adjacent to a corner of Scriber Creek Park and would require lead track guideways over the Interurban Trail to connect to the light rail alternatives. Part of the parcels that currently buffer the park and trails could also be developed. The light rail facility could be visible from some locations in the park but would be clearly visible from portions of the Interurban Trail. The Edmonds School District has a master plan for a support services building and bus storage facility on its property. The Lynnwood site alternative for the OMSF would overlap with the Edmonds School District property. Either project or potentially both projects would cumulatively increase the view impacts experienced by trail users, but overall impacts would remain minor.

No major additional changes to parks or recreational resources by other projects or actions are anticipated. The No Build Alternative and the light rail alternatives assume continued population and employment growth through 2040, which would likely increase the use of parks and recreational facilities throughout the project area.

4.17.6 Potential Mitigation Measures

For all of the affected resources, Sound Transit would work closely with the owning or managing jurisdictions to design and implement measures and construction plans that minimize potential long-term and construction effects. Many of the mitigation measures identified in this EIS for other resources (visual and aesthetics, air quality, water quality, neighborhoods, noise and vibration, and transportation) would also reduce the potential effects on affected resources and their users. Similarly, where park property would be needed for the proposed project, Sound Transit would work with the agency that has jurisdiction to provide compensation, consistent with the procedures outlined in Section 4.1, Acquisitions, Displacements, and Relocations. Potential mitigation measures for the affected resources include:

- **Northacres Park** (Preferred Alternative 130th Street Station Option; Alternatives A5, A7, A10, and A11). Signage would limit potential parking impacts due to unauthorized parking by transit patrons.
- **Twin Ponds Park** (Alternatives A5 and A7). Signage would limit potential parking impacts due to unauthorized parking by transit patrons.
- **Ridgecrest Park** (all alternatives). Sound Transit would coordinate with the City of Shoreline to provide landscaping and restoration of the affected area, and place a barrier between the light rail facility and the park to function like the existing berm in buffering I-5 noise and views of I-5. The project would also design and rebuild 1st Avenue NE from NE 159th Street to NE 161st Street in coordination with the City, and transfer replacement property at the south end of the park, or other property as agreed to with the City, consistent with the requirements of Forward Thrust. The replacement land would be developed to a level comparable to the displaced park area, and the design process would include outreach in the adjacent neighborhood to inform roadway and park design, in coordination with the City.
- **Shoreline Park and Stadium** (Preferred Alternative and Alternative A1). Sound Transit would restore affected areas after construction, and would coordinate access improvements and construction activities with the Shoreline School District.

  For the Preferred Alternative NE 185th Street Station Option, Sound Transit would also enter into an agreement with the School District to develop the garage and establish a shared-use agreement for using the garage for stadium events or casual recreation.
- **Trails**. For all temporary trail closures or reroutes associated with construction, Sound Transit would coordinate with appropriate local jurisdictions to develop detours, and to provide public information and

detour routes with signage during construction to allow for continued connections.

- **Scriber Creek Park**. For Alternative C1, Sound Transit would need to address Section 4(f) requirements that have not yet been satisfied (see Section 4.18, Section 4(f) and Section 6(f) Evaluation). Sound Transit would coordinate with the City of Lynnwood and Snohomish County to develop landscaping and site improvements to offset the impact of guideway encroachments; options could also include expanding the park or improving trail connections. Any necessary property acquisition would be coordinated with both the City and the County, in accordance with original agreements funding the park. For Alternative C2, Sound Transit would either provide landscaping and trail improvements to reduce the visual impacts and related changes to the park's setting or it would implement other mitigation as agreed to with the City of Lynnwood.

For mitigation for construction impacts that do not involve physical changes to a park or recreational facility, Sound Transit would coordinate with appropriate jurisdictions and facility operators to minimize impacts. Mitigation for construction period impacts would include outreach to the public to provide information on temporary closures or detours; on-site signage describing the duration and type of temporary impacts; detour signage; temporary ADA improvements (for example, temporary curb ramps for detour routes that do not currently include curb ramps for existing sidewalks); and similar strategies to ensure the continued use and enjoyment of affected park facilities.

4.18 Section 4(f) and Section 6(f) Evaluation

This section addresses a federal law known as Section 4(f), which protects parks, recreation areas, historic and cultural resources, and wildlife and waterfowl refuges, and another law known as Section 6(f), which restricts the conversion of lands previously purchased with money from the Land and Water Conservation Fund (LWCF).

4.18.1 Section 4(f)

The U.S. Department of Transportation Act of 1966, Section 4(f), generally prohibits U.S. Department of Transportation (USDOT) agencies (including the FTA) from approving projects that would use land from:

> …a significant publicly-owned park, recreation area or wildlife and waterfowl refuge or any significant historic site, unless there is no feasible and prudent alternative to the use of land from the property and the action includes all possible planning to minimize harm to the property resulting from the use.

A *use* is generally defined as a transportation activity that permanently or temporarily acquires land from a Section 4(f) property, or that substantially impairs the important activities, features, or attributes that qualify the property as a Section 4(f) resource.

Section 4(f) applies to significant publicly owned parks and recreation areas that are open to the public; publicly owned wildlife and waterfowl refuges; and historic sites of national, state, or local significance. The USDOT regulations for Section 4(f) define historic properties as those listed in or eligible for the NRHP.

The Section 4(f) study area for this project is based on the APE used for cultural, archaeological, and historic resources (see Section 4.16, Cultural, Archaeological, and Historic Resources) and the parks and recreational resources analysis (see Section 4.17, Parks and Recreational Resources). This evaluation also takes into account the areas of effect and analyses from other environmental investigations, including acquisitions, displacements, and relocations; transportation; land use; noise and vibration; and visual and aesthetic resources.

4.18.2 "Uses" of Section 4(f) Resources

Under Section 4(f), a use can be permanent, temporary, or constructive.

Permanent use would acquire or incorporate all or part of a Section 4(f) property as part of the transportation facility.

Temporary use occurs when the project temporarily occupies any portion of the resource (typically during construction), and it substantially impairs the resources. A temporary occupancy can avoid being a Section 4(f) "use" if:

- The project would occupy the property less than the time needed for the construction of the project, and there will be no change in ownership;
- There are minimal changes to the Section 4(f) resource;
- There are no permanent adverse physical changes or interference with protected activities, features, or attributes of the resource;
- The land is restored to the same or better condition; and
- The federal, state, or local officials with jurisdiction over the resource and the authority over the land agree in writing that the use is not adverse.

Constructive, or indirect, use can occur when the project is near the Section 4(f) resource and has effects that substantially impair the protected activities, features, or attributes of a property. For example, a park property that is primarily a scenic viewpoint could have a constructive use if a transportation project blocks its views.

Conditions for Approval of a Use for a Section 4(f) Property

The FTA can approve a transportation use of a Section 4(f) property only if:

- The use of the property meets the requirements for a regulatory exception established under Section 4(f). For instance, a temporary occupancy can be allowed if it meets the requirements described above.

or:

- The use will have a *de minimis* impact on the property.

or:

- There is no feasible and prudent *avoidance* alternative to using the property; and
- The program or project includes all possible planning to minimize harm to the property resulting from the use.

De minimis impacts cannot "adversely affect the activities, features, and attributes" of a Section 4(f) resource. A *de minimis* impact finding can take into account any mitigation or enhancement measures that would be implemented, including design measures to avoid or reduce impacts. Before FTA can make this finding, it must send a written notice to notify the official with jurisdiction over the resource, and there must be an opportunity for public notice and comment (the Draft EIS comment period served this purpose for the Lynnwood Link Extension).

For public parks or recreation properties, a *de minimis* impact finding requires written concurrence from the agency with jurisdiction over the property, such as a city or county parks department. For historic and archaeological sites, a *de minimis* impact is allowed if FTA has determined "no adverse effect" in compliance with Section 106 of the NHPA (see Section 4.16). Prior to making a *de minimis* finding, FTA must send a written notice to the SHPO. If the SHPO concurs or does not object, FTA may proceed with a *de minimis* finding.

When FTA has made a *de minimis* determination, the project is not required to analyze avoidance alternatives for that Section 4(f) property.

Avoidance Alternatives and Least Harm Analysis

When a project's Section 4(f) impact would be greater than *de minimis*, FTA must consider whether there are feasible and prudent alternatives that would avoid the impact. As defined in the Section 4(f) regulation, an alternative is feasible if it can be built as a matter of sound engineering judgment. An alternative is prudent if:

- It meets the project purpose and need and does not compromise the project to a degree that makes it unreasonable to proceed in light of its stated purpose and need; and
- It does not cause extraordinary operational or safety problems; and

- It causes no other unique problems or severe economic or environmental impacts; and
- It would not cause extraordinary community disruption; and
- It does not have construction costs of an extraordinary magnitude; and
- There are no other factors that collectively have adverse impacts that present unique problems or reach extraordinary magnitudes.

If FTA finds that an alternative is not feasible and prudent, that alternative is removed from consideration as a way to avoid a Section 4(f) use. If there are no prudent and feasible alternatives that can avoid all Section 4(f) resources, then FTA must determine which alternative results in the least overall harm, after considering the following factors:

i. The ability to mitigate adverse impacts to each Section 4(f) property (including mitigation measures that result in benefits to the property);
ii. The relative severity of the remaining harm, after mitigation, to the protected activities, attributes, or features of the Section 4(f) property;
iii. The relative significance of each Section 4(f) property;
iv. The views of the official(s) with jurisdiction over each Section 4(f) property;
v. The degree to which each alternative meets the purpose and need for the project;
vi. After reasonable mitigation, the magnitude of any adverse impacts to resources not protected by Section 4(f); and
vii. Substantial differences in costs among the alternatives.

4.18.3 Section 6(f) Resources

The LWCF Act provides funds for acquiring or developing parks and recreation areas. Section 6(f) of the LWCF prohibits conversion of LWCF properties to a non-recreational purpose, without the approval of the U.S. Department of the Interior's National Park Service.

Sound Transit reviewed the records of grants under the LWCF, which are maintained by the Washington State Recreation and Conservation Office. There are two properties in the study area developed with LWCF funds: Twin Ponds Park in Shoreline and Jack Long Park in Mountlake Terrace. Neither property would be directly converted to a non-recreational use; the potential for indirect impacts (such as the possibility of transit users using the parks for unauthorized parking) is discussed in Section 4.18.5.

4.18.4 Section 4(f) Resources

Sound Transit's Section 4(f) analysis considered potential impacts on significant publicly owned parks, recreation areas, and NRHP-eligible historic properties in a

study area that extended 200 feet from any potential project feature. Sound Transit also reviewed existing public agency records and plans, performed field inspections, and coordinated with the agencies that own or have jurisdiction over the resources. The Section 4(f) analysis reflects Sound Transit's and FTA's research and coordination for Section 106 of the NHPA, as described in Section 4.16, and the parks and recreational analysis discussed in Section 4.17. These efforts helped Sound Transit and FTA identify the important features, qualities, and characteristics of potential Section 4(f) resources.

Sound Transit did not find any public wildlife and waterfowl refuges in the study area. Historic properties and parks and recreation properties were the only Section 4(f) resources found within the study area. The parks, recreation, or NRHP-eligible historic resources within the study area that qualify as Section 4(f) resources are shown on Figures 4.18-1a and 4.18-1b.

Historic Resources

Sound Transit conducted a historic resources field survey considering every property within 200 feet of any of the alternatives. The survey documented every property built on or before 1970, although the standard age threshold for NRHP eligibility is 50 years. Over 600 properties were surveyed. Four historic resources have been determined eligible for listing in the NRHP.

Table 4.18-1 lists the historic resources in the study area.

Table 4.18-1. Historic Properties

Address	Description	Construction Date	Historic Status	Section 4(f) Resource?
11200 1st Avenue NE, Seattle (Segment A)	Northgate Plaza Apartments	1951	Eligible NRHP Criterion C	Yes
11725 1st Avenue NE, Seattle (Segment A)	Northgate Elementary School	1956	Eligible NRHP Criterion C	Yes
132 NE 155th Street, Shoreline (Segment A)	Log House	1920	Eligible NRHP Criterion C	Yes
13130 5th Avenue NE, Seattle (Segment A)	Parsonage	c. 1920	Eligible NRHP Criterion C	Yes

Field surveys, records reviews, and contacts with tribes in the study area and the SHPO revealed no significant archaeological resources or traditional cultural properties in the study area.

For more detail on individual historic resources in the study area and the project's Section 106 research and consultation efforts, see Section 4.16 and the *Cultural, Archaeological, and Historic Resources Technical Report.*

Parks and Recreational Resources

Table 4.18-2 lists parks and recreational resources in the study area, and identifies the resources qualifying as Section 4(f) or Section 6(f) properties. Section 4.17 has more detail about these resources.

Table 4.18-2. Parks and Recreational Properties Reviewed for Section 4(f) and Section 6(f) Eligibility

Park Facility and Owner or Jurisdiction	Size	Recreational Uses	Section 4(f) Resource?	Section 6(f) Resource?
Segment A: Seattle to Shoreline				
Jackson Park Golf Course, City of Seattle	161 acres	Golf, walking trail	Yes	No
Northacres Park, City of Seattle	21 acres	Baseball, softball, soccer, nature trails, off-leash dog area, children's playground	Yes	No
Twin Ponds Park, City of Shoreline	22 acres	Soccer, tennis, nature viewing, trails, playground	Yes	Yes
Ridgecrest Park, City of Shoreline	3.8 acres	Baseball diamond, handball, open grass	Yes	No
Shoreline Stadium, Shoreline Public Schools	40 acres	Football/soccer/track and field stadium with adjacent parking area	Yes	No
Segment B: Shoreline to Mountlake Terrace				
Interurban Connector Trail, City of Shoreline	(planned)	Planned signed bicycle and trail route connecting Interurban and Burke-Gilman trails, crossing I-5	No. Planned trail on city streets and WSDOT-owned facilities is considered a transportation facility.	No.
North City Park, City of Shoreline	4 acres	Forest trails, plus adjacent school has open public playgrounds and fields	Yes	No
Veterans Memorial Park, City of Mountlake Terrace	10 acres	Forested walking trails, gazebo, and picnicking	Yes	No
Jack Long Park, City of Mountlake Terrace	3 acres	Nature trails, picnicking, horseshoes	Yes	Yes
Segment C: Mountlake Terrace to Lynnwood				
Interurban Trail, Snohomish County PUD, City of Lynnwood	15 miles	Walking, running, bicycling, skating	Yes	No
Scriber Creek Trail, City of Lynnwood	1.5 miles	Walking, running, nature viewing	Yes	No
Scriber Creek Park, City of Lynnwood	4.7 acres	Nature park with parking, picnicking area, short loop nature trail in the north section of the park and Scriber Creek Trail section to the south	Yes	No

4.18.5 Potential Impacts on Section 4(f) and Section 6(f) Resources

Sound Transit reviewed all locations where Section 4(f) or Section 6(f) properties could be affected by light rail alternatives. Table 4.18-3 summarizes the potential impacts. Unaffected properties in the study area are not listed. For Section 6(f) resources, Sound Transit's analysis concluded there would be no potential for a direct or indirect conversion of any part of Twin Ponds Park or Jack Long Park, satisfying Section 6(f) requirements.

The Draft EIS included a preliminary Section 4(f) evaluation, as well as a listing of potential *de minimis* findings FTA was considering. The public review period for the Draft EIS also served as a public notice and comment opportunity for *de minimis* findings for the alternatives studied in the Draft EIS.

For this Section 4(f) evaluation, Sound Transit and FTA have coordinated with the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood, as well as with the Snohomish County PUD and the Shoreline School District, which are the resource owners or managing jurisdictions for parks and recreational facilities in the project area. Through the Section 106 process, Sound Transit and FTA have also consulted with the SHPO and tribes on cultural and historic resources.

The Section 4(f) evaluation identifies potential uses of Section 4(f) resources, along with mitigation and avoidance measures. The evaluation considers public comments on the Draft EIS, and reflects Sound Transit and FTA coordination with the agencies with jurisdiction as they developed measures to minimize and mitigate impacts. The impacts include acquisition and conversion of properties to a transportation use, as well as proximity impacts that could affect the property (which federal regulations refer to as a "constructive use"). Where FTA has found no Section 4(f) use, it means there are no impacts that would adversely affect the features, attributes, or activities qualifying the properties as Section 4(f) resources.

Table 4.18-3. Section 4(f) Impacts

Section 4(f) Resource	Alternatives	Section 4(f) Use Determination
PARK AND RECREATION PROPERTIES		
Jackson Park Golf Course	Preferred Alternative and all other Segment A alternatives	No Section 4(f) use.
Ridgecrest Park, City of Shoreline	Preferred Alternative and all other Segment A alternatives	*De minimis.* Light rail facility would be located on the west edge of the park, removing a berm and trees that provide an existing visual buffer. The park would experience property and visual impacts but current park functions and activities would not be substantially changed. In addition to restoring areas affected by construction, including providing a barrier to replace an existing berm, Sound Transit would

Table 4.18-3. Section 4(f) Impacts

Section 4(f) Resource	Alternatives	Section 4(f) Use Determination
		provide replacement property to the south of the park to compensate for parkland converted to transportation use, with features and design details to be developed during final design with the City of Shoreline. Shoreline has signed a letter of concurrence.
Northacres Park, City of Seattle	Preferred Alternative with NE 130th Street Option; Alternatives A5, A7, A10, and A11	No Section 4(f) use. Unauthorized parking by transit users would be prohibited.
Twin Ponds Park, City of Shoreline	Alternatives A5, A7, and A11	No Section 4(f) use. Unauthorized parking by transit users would be prohibited.
Shoreline Stadium, Shoreline School District	Preferred Alternative, Alternative A1	*De minimis*. With the Preferred Alternative and Alternative A1, the garage between 5th Avenue NE and I-5 would require a minor right-of-way acquisition for a roadway realignment and new retaining wall, affecting part of the larger parcel containing the stadium, and affecting several parking spaces for the stadium. Sound Transit would restore affected areas and make facility improvements defined in coordination with the Shoreline School District during final design. The District has signed a letter of concurrence.
	Preferred Alternative with Shoreline Stadium Parking Garage Option	Potential *de minimis* only if Shoreline School District concurs. With this option for a shared-use garage on the stadium parking lot, Sound Transit would build a garage on District property, with spaces to be available for stadium users, and replacement parking supplied off site during construction. Sound Transit would provide landscaping, access improvements, restoration of other affected areas, and coordinated planning with the District during final design and construction. FTA has determined that the impact would qualify as *de minimis* if the District concurs. However, the Shoreline School District has not yet concurred, and the option could not be selected for further development without future written agreement by the District.
North City Park, City of Shoreline	Preferred Alternative and all other Segment B alternatives	No Section 4(f) use.
Veterans Memorial Park, Mountlake Terrace	Segment B Preferred Alternative, B1 and B2A	No Section 4(f) use. Alternative B1 has an option for a parking garage on the existing surface lot adjacent to the park. There are no direct impacts to the park, and potential indirect impacts would not cause a constructive use of park property.

Table 4.18-3. Section 4(f) Impacts

Section 4(f) Resource	Alternatives	Section 4(f) Use Determination
Jack Long Park, City of Mountlake Terrace	Alternatives B1 and B4	No Section 4(f) use.
Interurban Trail, Snohomish County PUD, City of Lynnwood	Preferred Alternative	No Section 4(f) use. No direct or constructive long-term 4(f) uses. Temporary construction closures meet the criteria for temporary occupancy. The City of Lynnwood has agreed in writing that the project meets Section 4(f) exceptions for temporary occupancy during construction. Detour routes to be provided during short-term construction closures.
	All other Segment C alternatives	No Section 4(f) use, presuming written agreement with the City of Lynnwood. (Sound Transit requested written agreement specifically for the Preferred Alternative.)
Scriber Creek Park, City of Lynnwood	Preferred Alternative	No Section 4(f) use.
	Alternative C1	Section 4(f) use. The alternative would occupy part of the park with columns and would remove trees and vegetation.
	Alternative C2	No Section 4(f) use. There is no direct use, and mitigation would reduce visual and setting impacts to levels that would not impair the park's essential functions, attributes, and activities.
	Alternative C3	No Section 4(f) use.
Scriber Creek Trail, City of Lynnwood	Preferred Alternative	No Section 4(f) use. The City of Lynnwood has agreed in writing that the project meets Section 4(f) exceptions for temporary occupancy during construction. Detour routes would be provided during short-term construction closures.
	Alternatives C2 and C3	No Section 4(f) use, presuming written agreement with the City of Lynnwood. (Sound Transit requested written agreement specifically for the Preferred Alternative.)
HISTORIC PROPERTIES		
Northgate Plaza Apartments	All Segment A alternatives	No Section 4(f) use.
Log House	Alternatives A5 and A7	No Section 4(f) use.
Northgate Elementary School	Alternatives A1, A5, and A10	No Section 4(f) use.
Parsonage	All Segment A alternatives	No Section 4(f) use.

Segment A

Northgate Plaza Apartments (Historic)

All Segment A Alternatives, including the Preferred Alternative, would place the light rail guideway between the Northgate Plaza Apartments and I-5, which would alter some views to and from the apartments. No alternative would physically alter the building or the property or adversely affect the property's historic qualities. While the guideway would be visible adjacent to I-5, it would not impair the building's historic qualities, and would not rise to the level of a constructive use.

Log House (Historic)

Alternatives A5 and A7 include a NE 155th Street Station several properties away, and a park-and-ride structure would be across an arterial from the historic log house. There would be no physical impacts, and the development of nearby areas for light rail would not substantially impair its historic characteristics, which do not depend on its setting.

Northgate Elementary School (Historic)

While the Preferred Alternative would have no effect, several at-grade/elevated alternatives (A1, A5, and A10) would reconstruct the NE 117th Street bridge over I-5, which is adjacent to the Northgate Elementary School. The reconstruction of the bridge would not alter the historic characteristics of the school building. There would be no Section 4(f) use of the property by any alternative.

Parsonage (Historic)

None of the alternatives would require any land from the parsonage building. Alternatives A1, A5, and A10 would have no effects on the parsonage, and the elevated alternatives (A3, A7, and A11) would install noise walls along the guideway to avoid noise impacts. None of the alternatives would alter the historic characteristics of the parsonage, and there would be no Section 4(f) use.

Jackson Park Golf Course

None of the light rail alternatives would acquire any part of the Jackson Park Golf Course property, and no other impacts would rise to the level of a Section 4(f) use. All alternatives would be visible from the golf course, and the elevated alternatives (A3, A5, A7, and A11) would have visual impacts, as noted in Section 4.5, Visual and Aesthetic Resources. The change in views would not impair the ongoing recreational activities, features, and attributes of the golf course.

Ridgecrest Park

All alternatives would acquire about 0.30 acre of Ridgecrest Park property along its west side, adjacent to a parking area and a baseball diamond. They would cut into a berm and remove mature cottonwoods that buffer the park from I-5, and they would

also alter the parking area and southern entrance during construction. Viewpoints 19 and 20 in Appendix G, Visual Simulations and Illustrations, show a visual simulation of this potential change to the park.

The affected area is at the edge of the park and does not alter the recreational activities or features of the park. This is an active-use, recreational park that is not considered noise-sensitive, and it would not have noise impacts under FTA criteria even if it were a noise-sensitive property. For the Preferred Alternative, Sound Transit would replace the acquired park property with additional property to the south of the park, which it would develop for the City as parkland in conjunction with a 1st Avenue NE realignment. Design details and features for the replacement park property would be consistent with features of property acquired for the project, and defined in coordination with the City and public outreach to adjacent neighborhoods during final design. Other measures to restore and enhance park features include re-landscaping affected areas, and placing a wall or barrier along the guideway's eastern side to provide a safety and visual buffer between the park and the light rail facility and I-5. The barrier, which could also be combined with residential noise walls required for the project, would also help shield the park from I-5 noise. The City of Shoreline concurs with the *de minimis* finding (see Appendix D, Section 4(f)/Section 6(f) Correspondence).

Shoreline Stadium

The Preferred Alternative and Alternative A1 would acquire about 0.18 acre of a parcel encompassing the stadium, a parking area, and adjacent facilities. It would be needed for a realignment of 5th Avenue NE (see Figure 4.18-1) to accommodate a parking garage on the west side of I-5 for a station at NE 185th Street. All the other Segment A alternatives place both the parking and the station on the east side of I-5, avoiding the Section 4(f) use. Also, an option for the Preferred Alternative would develop a shared use garage on the existing surface parking area south of the stadium.

For the Preferred Alternative and Alternative A1, the acquisition of land needed for the roadway realignment and a retaining wall would affect the edge of a parking lot serving the stadium and also a corner of the area adjacent to the track. Several parking spaces could be displaced, and some buffering landscape elements would be removed. An edge of a spur to the track also would be affected. In consultation with the Shoreline School District, Sound Transit has developed measures to offset these impacts, which include providing compensation for the acquired property, replacing parking spaces or redesigning the parking lot to replace lost parking, and coordinating final design and construction with the District to minimize effects on track and field activities or operations.

Considering the limited amount of land involved, as well as Sound Transit's mitigation measures and other commitments, FTA has determined the Preferred Alternative and Alternative A1 would have a *de minimis* impact. The Shoreline School District has concurred (see Appendix D).

For the optional garage on the stadium's surface parking lot, there would be no change to the stadium itself or the track and field facility. The new park-and-ride garage would be available to stadium users, subject to the terms of an agreement that Sound Transit and the School District would develop in exchange for the right to place the park-and-ride garage on District property. Sound Transit would develop design and construction details for the garage in coordination with the District. During construction of the garage, the current surface parking lot with about 72 spaces would be temporarily closed, but the stadium would remain open. For major events at the stadium during the construction period, Sound Transit would provide replacement parking or work with the District to direct users to existing spaces within the Conference Center complex. Given the lack of impacts to the stadium facility itself, and with the commitments to maintain access and adequate parking supply during construction, FTA has preliminarily determined the impact would qualify as *de minimis* if the District concurs, but for the option to be advanced, the District must agree in writing.

Northacres Park

Alternatives A5, A7, A10, and A11 would develop a NE 130th Street Station that would modify a street adjacent to Northacres Park. There would be no Section 4(f) use. Any potential for unauthorized use of the park's parking facilities would be managed by parking restrictions.

Twin Ponds Park

Alternatives A5, A7, and A11 would develop a NE 155th Street Station on the other side of the freeway. Any potential for unauthorized use of the park's parking facilities would be managed by parking restrictions. There would be no impacts on Twin Ponds Park and no Section 4(f) use.

Segment B

North City Park

All alternatives would remove part of a forested area on WSDOT land adjacent to North City Park, but no parkland would be acquired. Trees on the park property would not be disturbed and a visual buffer between the park and I-5 would be maintained. There would be no Section 4(f) use.

Veterans Memorial Park

Under the Preferred Alternative and Alternatives B1 and B2A, Sound Transit would develop a light rail station west of Veterans Memorial Park and within the current Mountlake Terrace Transit Center. The existing parking and traffic circulation at the transit center, immediately adjacent to the park, would be reconfigured. Alternative B1 has an option for a garage on the existing surface lot. No property within the park would be required by any of the alternatives. Construction activities would temporarily increase noise levels and visually alter areas adjacent to the park's western boundaries, but would not impair the important features and attributes of the park. Construction could also temporarily alter the transit center sidewalks connecting to a trail in the park, but the public would have several other ways to access the park. There would be no Section 4(f) use.

Jack Long Park

Alternatives B1 and B4 would be in the median of I-5, and the park is east of the freeway. The Preferred Alternative and Alternative B2A are to the west of I-5. There would be no effects and no Section 4(f) use.

Segment C

Interurban Trail

In Segment C, an elevated guideway would pass directly over short sections of the Interurban Trail for all alternatives (Viewpoint 43 in Appendix G). This would change the visual setting for part of the trail, but would not directly affect the essential activities, features, and attributes of the regional trail. Although the elevated guideway would be visually prominent to trail users, the trail is already in a variable urban setting with nearby roads, industrial properties, the freeway and its ramps, and other large infrastructure. The elevated guideway would require air rights; however, no piers or other appurtenances would be located on Section 4(f) property. Aerial structures passing over a Section 4(f) property are not considered a direct use.

The location of the light rail facility near the trail raises the possibility of indirect impacts, which are discussed below, but these impacts are not substantial enough to cause a constructive use of the property. Short-term closures of the trail would be necessary during construction, and would need to meet the criteria for temporary occupancy. The temporary occupancy analysis for the alternatives is also described below.

For the Preferred Alternative, the elevated guideway would cross over the Interurban Trail in an area where the trail has an open field and wetland area on one side and large industrial properties (including the Edmonds School District property) on the other. The alternative would then continue across Scriber Creek and the wetland area to a station on the southeast corner of the Lynnwood Transit Center. Existing

power poles beside the trail would be relocated and the transmission lines would be raised to provide clearance for the elevated light rail line. The light rail facility near a part of the trail would not substantially impair the trail's character, given other transportation facility crossings along the trail, and the light rail facility would not alter or impair trail activities.

During construction of the Preferred Alternative, the trail would need to be closed for the short term. Sound Transit would coordinate with the City of Lynnwood to develop a detour and provide signage and notices to users. There would be no physical change to the trail facility, which would be reopened in the same condition; ownership of the underlying property would remain the same; and replacement landscaping would be provided where vegetated areas might need to be cleared for construction. With these measures in place, the short-term construction impacts of the Preferred Alternative would qualify for a Section 4(f) exception for temporary occupancy, and no Section 4(f) use would occur. The City of Lynnwood has provided written concurrence for a temporary occupancy finding for the Preferred Alternative (see Appendix D).

For Alternatives C1 and C2, the light rail guideway would cross above the Interurban Trail at 52nd Avenue West. Some vegetation where the trail currently crosses the street would be removed, and the elevated guideway would pass overhead. The guideway would create shading and alter views at the existing arterial crossing, but this would not affect the trail's active recreational and trail travel activities.

Under Alternative C3, the elevated guideway would cross over the Interurban Trail, with similar effects as the Preferred Alternative. Tail tracks would also cross over the trail near 44th Avenue West. The presence of light rail facilities near sections of the trail would not be a notable change in the trail's character, and would not impair its activities.

As with the Preferred Alternative, the other alternatives would qualify for a temporary occupancy exception by providing detours and restoring the trail to the same or better condition; therefore, activities during construction would not involve a Section 4(f) use.

FTA did not request concurrence on temporary occupancy from the City of Lynnwood for the other alternatives. Written concurrence to a temporary occupancy determination would be required prior to the selection of alternatives other than the Preferred Alternative.

Scriber Creek Park

Preferred Alternative. The Preferred Alternative does not involve a Section 4(f) use of Scriber Creek Park because it does not physically alter the park or otherwise affect the protected activities, attributes, or features that qualify the park as a Section 4(f) resource. The Preferred Alternative would be about 1,000 feet from the

southern edge of the park, and any views of the guideway would be distant and intermittent. Construction work (such as cranes) may be noticeable from some areas of the park, but public activities in the park could continue without impairment.

Alternative C1. Under Alternative C1, an elevated guideway would pass above the entrance road and parking lot to Scriber Creek Park before curving to cross over a corner of the park and a portion of the creek. An elevated guideway would cross over 0.42 acre of the park, but a portion of the park property would be acquired for the structures that support the guideway (see Figure 4.17-4 in Section 4.17 for a diagram, and Viewpoints 38 and 39 in Appendix G). In addition to vegetation clearing that would include removing mature trees, the elevated guideway would affect views, light, and shade for part of the park. These impacts are described in more detail in Section 4.17.

Construction activities would also require a short-term closure of a portion of Scriber Creek Park. This would include all or part of the parking area and potentially the main entrance, but the trail entrance or an alternative entrance would be maintained to allow the park to remain open for normal public use.

The City of Lynnwood and Sound Transit have discussed mitigation measures to reduce and offset long-term and short-term impacts that Alternative C1 would have on the park. The measures include providing additional landscaping after construction, restoring affected natural areas to minimize impacts on the park's natural setting, and implementing potential enhancements such as trail improvements. However, following public comments on the Draft EIS, the City of Lynnwood has stated that the impacts would be adverse, and the City does not agree to a *de minimis* finding. Therefore, FTA has determined that a Section 4(f) use would occur with Alternative C1, and other prudent and feasible alternatives to avoid the use must be considered. Unless Alternative C1 were either modified to avoid the park property or to reduce impacts to a *de minimis* level (any occupation of the park requires agreement by the City of Lynnwood), FTA cannot approve a project featuring this alternative. The other Segment C alternatives would be feasible and prudent avoidance alternatives available to the Sound Transit Board.

Alternative C2. Under Alternative C2, no parkland would be acquired. The elevated guideway would pass over a non-park area adjacent to and south of Scriber Creek Park near the park's nature trail, which also forms part of the Scriber Creek Trail (see Appendix G, Viewpoints 41 and 42, for visual simulations). Section 4.17 describes the impacts on the park in more detail; impacts would include visual impacts and construction-related visual, noise, and dust impacts to park users.

The City of Lynnwood and Sound Transit have considered mitigation measures to help offset these impacts. Restoring cleared areas with natural plantings would maintain and enhance the park's natural setting. Landscaping and other improvements to other areas of the park would minimize impacts to park users. Other mitigation options include creating additional trail, park, or wetland natural improvements on other nearby properties that would be acquired for the light rail project. Alternative C2 would also require wetland mitigation, which would present additional opportunities to restore the wetlands in conjunction with measures to restore and enhance the park's natural setting. With such mitigation measures in place to help maintain the natural characteristics of the park and its boardwalk, FTA anticipates no constructive use of the park, as defined for Section 4(f).

No other impacts would impair the park to the level rising to a constructive use. A high level of ambient noise already exists at the park due to the nearby freeway, roadways, and adjacent light industrial properties. The light rail guideway would have noise barriers along the guideway to avoid noise impacts to nearby residences, which would also minimize the change in noise levels within the park.

Alternative C3. Under Alternative C3, Scriber Creek Park would not have any direct property or vegetation impacts. The light rail facility may be visible from parts of the wetland boardwalk, but only from a distance, and the intermittent views of the guideway would not impair the park's setting or any other important features, activities, or attributes. Construction work may be noticeable from the park, but public activities in the park could continue without impairment. There would be no Section 4(f) use.

Scriber Creek Trail

All alternatives would cross over part of the Scriber Creek Trail, but no trail property would be permanently acquired.

With all four alternatives, the trail would continue to maintain its essential function of connecting parks to a regional trail, and there would be no permanent direct or constructive use of the trail. Sound Transit would coordinate with the City of Lynnwood to provide a detour during a temporary closure of the trail for construction. The trail would be reopened in the same or better condition than today and replacement landscaping would also be provided. With these measures in place, the short-term construction impacts qualify for a temporary occupancy

exception, and there would be no Section 4(f) use of the trail with any of the alternatives. The City of Lynnwood has agreed in writing to this exception for the Preferred Alternative (see Appendix D).

For the other alternatives, Sound Transit would apply the same measures as the Preferred Alternative, written concurrence with a temporary occupancy exception would still be needed before any other alternative would be implemented.

4.18.6 Conclusions and Section 4(f) Findings

Section 4(f) regulations do not allow FTA to approve an alternative with a Section 4(f) use if there are prudent and feasible avoidance alternatives, unless there is a *de minimis* finding.

Preferred Alternative

The Preferred Alternative would acquire a portion of Ridgecrest Park adjacent to the freeway. Given the minor impacts to the park and Sound Transit's mitigation commitments, and the results of coordination with the City of Shoreline, FTA has determined the impacts would be *de minimis*. The City of Shoreline has signed a letter of concurrence.

The Preferred Alternative, with the mitigation commitments Sound Transit has identified, would have *de minimis* impacts to Shoreline Stadium. The Shoreline School District has concurred in writing with the *de minimis* finding. An option for the Preferred Alternative to place a parking garage on an existing surface lot is also anticipated to have *de minimis* impacts, with the mitigation measures and related commitments to maintain adequate parking supply for stadium activities during construction. The Shoreline School District has not yet agreed to a *de minimis* finding. The option could not be selected for further development without written agreement by the District.

The Preferred Alternative would cross over the Interurban Trail and the Scriber Creek Trail. The project would require air rights only, would not convert land from the trails, and would not substantially impair important activities, features, or attributes of the trails. During construction, Sound Transit would provide signage, detour routes, and construction mitigation measures to address the impacts of a trail closure during construction. These commitments and the written concurrence from the City of Lynnwood meet the requirements for Section 4(f) temporary occupancy exceptions for the trails; neither trail would have a Section 4(f) use.

Appendix D provides the letters of concurrence by the City of Shoreline and the Shoreline School District on the *de minimis* findings, as well as the letter of agreement signed by the City of Lynnwood regarding the temporary occupancy exceptions for the project.

Other Light Rail Alternatives

All of the Segment A alternatives would require a portion of Ridgecrest Park adjacent to the freeway. Given the minor impacts to the park and Sound Transit's mitigation commitments described for the Preferred Alternative, they would also have *de minimis* impacts. For the Shoreline Stadium, Alternative A1 would have the same *de minimis* impacts as the Preferred Alternative.

Alternative C1 involves a Section 4(f) use of Scriber Creek Park. It could not be implemented as part of the project unless it were redesigned to avoid the use of the park or mitigate any park impact to *de minimis* levels. The Preferred Alternative and Alternatives C2 and C3 all avoid the park and any other Section 4(f) uses. These alternatives would be reasonable and feasible avoidance alternatives to the Section 4(f) use of Scriber Creek Park.

In Segment C, Alternatives C1, C2, and C3 cross over the Interurban Trail and the Scriber Creek Trail. As with the Preferred Alternative, they would require air rights only, and would not convert land from the trails, or permanently impair the important activities, characteristics, or features of the trail. For construction, Sound Transit would provide signage, detours, and related construction mitigation measures to address the impacts of a trail closure during construction. These commitments meet the requirements for Section 4(f) temporary occupancy exceptions, but written concurrence from the City of Lynnwood would be needed.

5 EVALUATION OF ALTERNATIVES

This chapter begins by evaluating how well the Lynnwood Link Extension alternatives meet the project's Purpose and Need Statement. It then compares the environmental and transportation performance of the project alternatives, discusses their costs, and reviews other implementation issues.

5.1 Ability to Meet the Purpose and Need

The Purpose and Need Statement, presented in Chapter 1, is summarized in Table 5-1, which compares the No Build Alternative and light rail alternatives with the project's Purpose and Need. Each Purpose and Need objective is discussed further below.

Table 5-1. Consistency with Project Purpose and Need

Purpose and Need	No Build Alternative	Preferred Alternative	Other Light Rail Alternatives
Provide reliable, rapid, and efficient transit service with sufficient capacity to meet current and projected demand	No	Yes	Yes
Forecast year 2035 transit travel times on I-5 from Lynnwood to Northgate (AM peak period)	26 minutes	14 minutes	14 to 16 minutes
Forecast year 2035 transit travel times on I-5 from Northgate to Lynnwood (PM peak period)	24 minutes	14 minutes	14 to 16 minutes
Forecast year 2035 PM peak hour passenger load transit level of service at screenlines on I-5	LOS D–F	LOS A–C	LOS A–C
Create an alternative to travel on congested roadways	No	Yes	Yes
Support the region's adopted land use, transportation, and economic development plans	No	Yes	Yes
Extend the regional light rail system in support of the Sound Transit Long-Range Plan	No	Yes	Yes
Implement a financially feasible system that seeks to preserve and promote a healthy environment	No	Yes	Yes

Provide reliable, rapid, and efficient transit service with sufficient capacity to meet current and projected demand

All of the light rail alternatives would offer reliable, rapid, and efficient transit service with sufficient capacity to meet current and projected demand. They would be very reliable because they would operate outside of traffic. In contrast, under the No Build Alternative, bus service would be less reliable than today as traffic congestion increases on freeways and arterials in the project corridor.

Travel times to all regional destinations would be shorter with the light rail alternatives, with trips to Northgate and downtown Seattle 5 to 16 minutes faster

than the No Build Alternative depending on where a trip starts. The light rail alternatives also would expand the person-carrying capacity of the I-5 corridor and would reduce bus overcrowding as some riders shift from bus to light rail.

Create an alternative to travel on congested roadways

All of the light rail alternatives would bypass congested roadways by operating on an exclusive at-grade or elevated guideway. With light rail operating at least every 10 minutes for the majority of the day and offering faster travel times than bus service, travelers would have a more time-competitive and reliable alternative to driving on congested roadways.

Support the region's adopted land use, transportation, and economic development plans

To address future population and employment growth, all regional, state, and local land use and transportation plans include a goal of improving transit accessibility and encouraging transit use; in addition, economic development plans call for reducing congestion to increase mobility of goods and services. All of the light rail alternatives support these long-range planning goals, and they are generally consistent with the land use plans and policies of the jurisdictions served by the project. Local and regional plans anticipate growth in urban centers that are connected by high quality transit. In the project corridor, the major urban growth centers are at Lynnwood and Northgate, which would be connected by light rail. Other station areas included in local jurisdictions' transit-supporting plans or policies include the NE 145th Street Station (Preferred Alternative and Alternatives A1, A3, A10, and A11) and NE 185th Street Station (all light rail alternatives) in Shoreline; the Mountlake Terrace Transit Center or Freeway Station in Segment B; and the 220th Street SW Station (an option for the Preferred Alternative and part of Alternative B2A) in Mountlake Terrace.

Light rail construction and operation would directly support economic development goals by creating jobs. Moreover, light rail can encourage future private development and investment near stations if supportive land use designations are in place, which would result in further economic benefits and advance the region's economic development plans.

Extend the regional light rail system in support of the Sound Transit Long-Range Plan

Sound Transit's Long-Range Plan calls for extending regional transit north to Everett. Any of the light rail alternatives would help implement the Long-Range Plan.

Implement a financially feasible system that seeks to preserve and promote a healthy environment

All of the light rail alternatives have project construction and operating costs similar to those considered in the financial plan developed as part of the ST2 program. Compared to the No Build Alternative's all-bus system, the light rail alternatives would be more efficient and financially feasible to operate, particularly as the demand for transit service increases. The transit system with the No Build Alternative would also become increasingly expensive to operate given increased congestion and travel times, which would be in addition to the service hours needed to meet projected travel demand. The light rail alternatives would create environmental benefits through air quality and greenhouse gas improvements, cleanup of previously contaminated sites, reduced noise, and improved stormwater management. They would also best support regional plans to manage growth and reduce the environmental problems associated with sprawl.

5.2 Comparison of Ridership, Environmental Impacts, and Benefits of Light Rail Alternatives

This section summarizes the ridership, environmental impacts, and benefits that differentiate the light rail alternatives. While this discussion focuses on their major differences, a complete summary of all environmental issues is provided in the Summary to this Final EIS.

5.2.1 Segment A: Seattle to Shoreline

Table 5-2 displays the key measures that differentiate the seven alternatives being considered in Segment A, including cost, transportation, and environmental performance. The alternatives represent two basic types of choices:

- Would it be better to have the alternatives at-grade wherever possible, with limited elevated sections, or would it be better to be mostly elevated?
- Should there be two or three stations, and where should they be placed?

As Table 5-2 shows, all Segment A alternatives would have a similar number of residential displacements due to property acquisitions. While all of the alternatives seek to minimize property acquisitions by using WSDOT right-of-way as much as possible, in some locations, there is not sufficient room to accommodate any of the alternatives without requiring other property. The primary differences in right-of-way needs are at the stations, although the elevated alternatives (A3, A7, and A11) would be able to avoid impacts in some areas. There would be similar numbers of properties affected by the difference in choices for stations with park-and-rides at NE 145th Street (Preferred Alternative, A1, A3, A10, and A11) and NE 155th Street

Table 5-2. Comparison of Segment A Alternatives

	Alternative	Preferred Alternative	A1	A3	A5	A7	A10	A11
	Stations	Two: NE 145th and NE 185th Streets	Two: NE 145th and NE 185th Streets	Two: NE 145th and NE 185th Streets	Three: NE 130th, NE 155th, and NE 185th Streets	Three: NE 130th, NE 155th, and NE 185th Streets	Three: NE 130th, NE 145th, and NE 185th Streets	Three: NE 130th, NE 145th, and NE 185th Streets
	Profile	Mixed At-Grade and Elevated	Mixed At-Grade and Elevated	Mostly Elevated	Mixed At-Grade and Elevated	Mostly Elevated	Mixed At-Grade and Elevated	Mostly Elevated
Category[a]	Measure							
Capital Cost Range[b]	2014 dollars (in millions)	$730 to $840	$760 to $880	$790 to $910	$740 to $850	$830 to $950	$750 to $860	$850 to $970
Ridership	2035 daily boardings (net)[c]	12,600 (13,000[d])	12,600	9,500	13,000	10,900	10,900	10,900

Table 5-2. Comparison of Segment A Alternatives

	Alternative	Preferred Alternative	A1	A3	A5	A7	A10	A11
	Stations	Two: NE 145th and NE 185th Streets	Two: NE 145th and NE 185th Streets	Two: NE 145th and NE 185th Streets	Three: NE 130th, NE 155th, and NE 185th Streets	Three: NE 130th, NE 155th, and NE 185th Streets	Three: NE 130th, NE 145th, and NE 185th Streets	Three: NE 130th, NE 145th, and NE 185th Streets
	Profile	Mixed At-Grade and Elevated	Mixed At-Grade and Elevated	Mostly Elevated	Mixed At-Grade and Elevated	Mostly Elevated	Mixed At-Grade and Elevated	Mostly Elevated
Category[a]	Measure							
	Estimated WSDOT right-of-way needed (acres)	19	26	20	20	19	25	20
Visual and Aesthetic Resources	Low-medium-high impact	Medium	Medium	High	Medium	High	Medium	High
Ecosystem Resources	Wetland/buffer acres affected	0.9 / 0.3	0.9 / 0.3	0.9 / 0.3	0.9 / 0.8	0.9 / 0.8	0.9 / 0.3	0.9 / 0.3
	Acres of forest vegetation removed	2	2	1	2	1	2	2
Noise	Number of properties affected before/after mitigation[f]	306 (309[d])/ 0	234 / 0	476 / 0	303 / 0	493 / 0	283 / 0	476 / 0
Vibration	Number of properties affected before/after mitigation	27 / 0	9 / 0	8 / 0	16 / 0	9 / 0	14 / 0	8 / 0
Parks and Recreational Resources	Resources directly affected	Ridgecrest Park, Shoreline Stadium	Ridgecrest Park, Shoreline Stadium	Ridgecrest Park	Ridgecrest Park	Ridgecrest Park	Ridgecrest Park	Ridgecrest Park

[a] Only categories with notable impacts or differences among alternatives are shown; Chapters 3 and 4 include the full results for all environmental topics.

[b] Range reflects contingencies for a conceptual level design. Figures rounded to the nearest $10 million.

[c] The net boardings reflect ridership at all the segment stations, minus the drop in ridership that would occur at the Northgate Station; the more sizeable drop is with a station located at NE 130th Street, which overlaps more with the Northgate Station ridership area than a station at NE 145th Street.

[d] Parentheses show when the 130th Street Station Option for the Preferred Alternative is included.

[e] Includes on-street and off-street parking. Does not include park-and-ride spaces.

[f] Includes park-and-ride noise impacts.

(A5 and A7). The NE 185th Street Station options would have different property impacts, depending on whether the parking is in a multistory garage on the west side of the freeway (Preferred Alternative and A1), on the east side with surface lots (A5 and A10), or in a parking structure to the east (A3, A7, and A11).

Transportation impacts would primarily occur at the station sites where some intersections would have increased delays, but Sound Transit would use mitigation measures to reduce delays to conditions similar to the No Build Alternative or better. Several of the alternatives have stations or alignments that would rebuild I-5 ramps at NE 130th Street or NE 145th Street, requiring FHWA and WSDOT approvals; these changes would not affect the performance of ramps or adjacent areas of the freeway.

All Segment A alternatives would require noise walls, barriers, and other mitigation measures to alleviate noise impacts at properties along the corridor. These measures would satisfactorily mitigate noise impacts to levels below FTA criteria. Similarly, all alternatives include design measures to reduce vibration to be below FTA's impact threshold.

Impacts on water resources and ecosystems would be relatively similar; the mostly elevated alternatives (A3, A7, and A11) would have more opportunities to avoid impacts through design.

Impacts on parks and recreation facilities would be generally similar among all Segment A alternatives, with all alternatives requiring an edge of Ridgecrest Park in Shoreline. The mostly elevated alternatives (A3, A7, and A11) would have more impacts on views from the Jackson Park Golf Course. The Preferred Alternative and Alternative A1 include a roadway realignment that would affect a small part of the Shoreline Stadium parking lot, and the Preferred Alternative also has an option to develop a garage on the stadium's lot.

Overall, the mostly elevated alternatives (A3, A7, and A11) have higher costs but lower impacts compared with the mostly at-grade alternatives (including the Preferred Alternative), except for having higher visual impacts.

Among the station pairing choices, alternatives featuring a NE 130th Street Station as part of a three-station configuration in Segment A (A5, A10, and A11, and an option for the Preferred Alternative) rather than two stations (Preferred Alternative, A1, and A3) would have more access points but longer travel times and higher costs. Three stations could add about 400 daily boardings in Segment A because some users in north Seattle would find the NE 130th Street Station more convenient to use than the Northgate Station. While this is an increase in project ridership, it would not increase overall Link system ridership. Any three-station pairing would have about the same ridership and effects as any two-station combinations.

There are also tradeoffs between having a station at NE 145th Street or at NE 155th Street. The NE 145th Street Station alternatives (Preferred Alternative, A1, A3, A10, and A11) would displace residential properties, require street or interchange modifications, and place a multistory parking garage near residences. However, the station would serve several populous neighborhoods in Seattle and Shoreline, and it would have convenient I-5 access. The NE 155th Street Station (A5 and A7) would also displace residences, and add a multistory garage in a mostly residential area, but would lack I-5 access adjacent to the station. The City of Shoreline's planning policies identify stations at NE 145th Street and NE 185th Street, and the City has conducted station planning at those locations, including plans for higher density development at the NE 185th Street Station area. The City's policies do not anticipate a station at NE 155th Street, which would also need to be paired with a second station to allow light rail to serve Seattle neighborhoods.

The NE 130th Street Station (A3, A7, A10, and A11) would not appreciably increase environmental impacts or ridership compared with alternatives that do not include this station; it would mostly attract riders who would otherwise use the NE 145th Street Station or Northgate Station. While the NE 130th Street Station would increase costs, it could be paired with either a NE 145th Street Station or NE 155th Street Station with little difference in other effects.

The NE 185th Street Station would have similar ridership for all options. Costs and impacts tend to be the differentiating factors. At-grade alternatives (Preferred Alternative, A1, A5, and A10) would have more street and/or bridge reconstruction, while the elevated alternatives would have more visually prominent guideways and stations. The siting and configuration for parking elements is generally interchangeable among the alternatives, but the choices for structures or surface lots, as well as their siting, would determine which properties would be acquired. All of the alternatives would affect some residential properties; however, the alternatives with parking to the east of I-5 (A3, A5, A7, A10, and A11) would impact more residences.

5.2.2 Segment B: Shoreline to Mountlake Terrace

Table 5-3 displays the key measures that differentiate the four Segment B alternatives. These alternatives vary in their station location at the Mountlake Terrace Transit Center; whether they continue north in the I-5 median, or cross to the west side of the freeway; and whether they offer a station at 220th Street SW. The Preferred Alternative and B2A cross to the west of the freeway, affecting more properties, while Alternatives B1 and B4 stay in the median.

Table 5-3. Comparison of Segment B Alternatives

	Alternative	Preferred Alternative	B1	B2A	B4
	Stations	One: Mountlake Terrace Transit Center	One: Mountlake Terrace Transit Center	Two: Mountlake Terrace Transit Center and 220th Street SW	One: Mountlake Terrace Freeway Station
	Alignment	I-5 East Side to I-5 West Side	I-5 East Side to I-5 Median	I-5 East Side to I-5 West Side	I-5 East Side to I-5 Median
Category[a]	Measure				
Capital Cost[b]	2014 dollars (in millions)	$450 to $510	$390 to $450	$530 to $610	$360 to $410
Ridership	2035 daily boardings (net)[c]	5,100 (5,300)[d]	5,100	5,100	4,300
Station Area Transit-Oriented Development	Qualitative rating of potential under existing conditions (limited-moderate-strong)	Mountlake Terrace Transit Center: moderate-strong	Mountlake Terrace Transit Center: moderate-strong	Mountlake Terrace Transit Center: moderate-strong 220th Street SW: moderate	Mountlake Terrace Freeway Station: moderate
Property	Number of parcels affected	15 (21)[d]	5	18	6
	Number of residences displaced	3 (8)[d]	0	5	0
	Estimated WSDOT right-of-way needed (acres)	17	14	16	15
Transportation	Number of parking spaces removed	0	0	11	0
	I-5 bridges rebuilt	NE 195th Street	NE 195th Street	NE 195th Street	NE 195th Street
Ecosystem Resources	Wetland/buffer acres affected	0.8 / 1.6 (0.5 / 1.6)[d]	Less than 0.1 / 0.9	1.6 / 1.3	0.2 / 0.7
	Acres of forest vegetation removed	11 (11)[d]	5	11	3
Visual and Aesthetic Resources	Qualitative rating (low-medium-high impact)	High	Low	High	Low
Noise	Number of properties affected before/after mitigation[e]	217 (202)[d] / 0	122 / 0	192 / 0	110 / 0

[a] Only categories with notable impacts or differences among alternatives are shown; Chapters 3 and 4 include full results.

[b] Range reflects contingencies for a conceptual level design. Figures rounded to the nearest $10 million.

[c] Net boardings within the segment, less any reduction in ridership that could occur in other segments with an additional station.

[d] The number in parenthesis is the Preferred Alternative with the optional station at 220th Street SW.

[e] Includes park-and-ride noise impacts.

The Preferred Alternative and B2A would have higher impacts on visual quality along I-5 from about 233rd Street SW to 220th Street SW. Existing dense vegetation would be cleared on the lower portion of the hillside on the west side of I-5, which would change the visual character of this area. Alternatives B1 and B4 would have lower visual impacts because more of their alignments would be in the I-5 median, although Alternative B4 would have a prominent pedestrian bridge over I-5. The median alignment for Alternatives B1 and B4 also would result in fewer noise impacts.

The vegetation removal mentioned above, where the Preferred Alternative and B2A alignments travel along the hillside west of I-5, would eliminate about 11 acres of forest cover compared to 5 acres with Alternative B1 and 3 acres with Alternative B4. Likewise, the Preferred Alternative and B2A would affect the most wetlands and wetland buffer because they would cross a large portion of the second largest wetland in the study area. Also, Alternative B2A and the Preferred Alternative with the option for a 220th Street SW station would create the most impervious surface and would require more mitigation measures to protect water resources.

Transportation impacts would not differentiate the alternatives in Segment B except during construction, when Alternative B4 would need to close the bus ramps at the current freeway transit stop for the Mountlake Terrace Transit Center. This would affect transit service to the transit center for several years.

The Segment B alternatives would have different ridership depending on whether a station is sited at the Mountlake Terrace Transit Center (Preferred Alternative, B1, and B2A) or its nearby freeway transit stop (Alternative B4); a freeway station would take longer for riders to access, which would reduce ridership. Alternative B2A and an option for the Preferred Alternative have an additional station at 220th Street SW, which could encourage transit-oriented development in this area, but the project's overall ridership would not notably increase. Although the added station would attract some riders, many of them would be riders switching from the Mountlake Terrace Transit Station and Lynnwood to the 220th Street SW Station. The longer travel time to stop at an added station would slightly lower overall ridership as well.

The Preferred Alternative and Alternatives B1 and B2A would best support potential transit-oriented developments in Mountlake Terrace's planned town center because their station would be east of I-5, at the existing park-and-ride with an entrance south of 236th Street SW. This would be closer to the planned town center than the Alternative B4 freeway station.

5.2.3 Segment C: Mountlake Terrace to Lynnwood

Table 5-4 displays the key measures that differentiate the performance of the four Segment C alternatives, including environmental impacts and property acquisition.

Alternative C1 would affect the most properties because it would displace up to 77 residences and 31 businesses in a condominium complex and two business

parks. In contrast, the Preferred Alternative would displace nine businesses, Alternative C3 would displace one business, and Alternative C2 would displace three businesses, with no residential impacts.

Alternatives C1 and C2 would have higher visual impacts because of the elevated guideway near residential properties and Scriber Creek Park, while the Preferred Alternative and Alternative C3 would have lower visual impacts.

Alternative C2 would cross the Scriber Creek wetland complex and affect the largest amount of stream and wetland buffer area. Alternative C1 would cross north of the wetlands over Scriber Creek Park. The Preferred Alternative would cross the southern end of the Scriber Creek wetland complex and would have less impact than Alternative C2, but more than Alternative C3.

Alternative C1 would have columns and a section of the elevated guideway within Scriber Creek Park along Cedar Valley Road. FTA has determined that converting part of the park to a transportation use would not be a minor impact, and a federal regulation known as Section 4(f) would require Sound Transit to choose other alternatives to avoid the use of parkland, unless Alternative C1 were redesigned to avoid the use of the park or Sound Transit mitigated the park impact to a *de minimis* level. Alternative C2 would not be in the park but the guideway and columns adjacent to the park would have visual impacts, primarily from the Scriber Creek Trail. The Preferred Alternative and Alternative C3 would not affect the park.

While all of the Segment C alternatives would serve the same area and have similar opportunities to support transit-oriented developments, the station site choices would provide different opportunities for developing the area over time. The Preferred Alternative would acquire four commercial properties to the north and east of the Lynnwood Transit Center and change those existing land uses; however, it would avoid cutting across property that the City of Lynnwood has identified for high-density development on the east side of 44th Avenue West.

The Preferred Alternative would have a plaza connecting to the intersection of 200th Street SW/Alderwood Mall Boulevard/44th Avenue West on the edge of the designated town center of Lynnwood, although the Alternative C1 station at 200th Street SW would be closest to the designated town center for Lynnwood. Alternative C1 would have the fewest impacts on the existing transit center and park-and-ride during construction. The Preferred Alternative and Alternatives C2 and C3 would temporarily reduce the current parking capacity at the transit center for the construction of a park-and-ride garage. Alternative C3 also has the option to relocate the existing transit center at the same time as the light rail is built, or the transit center could be relocated later, potentially as part of future transit-oriented development plans. However, Alternative C3 has a tail track that cuts across a large parcel that would otherwise be available for future transit-oriented development.

Table 5-4. Comparison of Segment C Alternatives

	Alternative	Preferred Alternative	C1	C2	C3
	Station	At park-and-ride	200th Street SW	At transit center	At park-and-ride
Category[a]	Measure				
Capital Cost[b]	2014 dollars (in millions)	$340 to $380	$330 to $380	$300 to $340	$300 to $390
Ridership	2035 daily boardings (net)[c]	17,900 (17,200[d])	17,600 to 17,900	17,600 to 17,900	17,600 to 17,900
Station Area Transit-Oriented Development	Qualitative rating of potential under existing conditions (limited-moderate-strong)	Lynnwood Park-and-Ride: moderate-strong	200th Street SW Station: moderate-strong	Lynnwood Transit Center: moderate-strong	Lynnwood Park-and-Ride: moderate-strong
Property	Number of parcels affected	18	31	29	15
	Number of residences displaced	0	77	1	0
	Businesses and institutions displaced	9	31	3	1
	Estimated WSDOT right-of-way needed (acres)	2	1	1	3
Transportation	Realigned streets	---	---	---	208th Street SW
	Number of parking spaces removed	27	8	4	0
	Number of intersections requiring mitigation	3(4[f])	3	3	3
Ecosystem Resources	Wetland/buffer acres affected	0.7 / 1.0	Less than 0.1 – 0.2 / 0.7 - 1.1	0.9-1.1 / 0.6 – 1.1	0.2 – 0.3/ 1.0 - 1.7
	Acres of forest vegetation removed	2	1	1	1-2
Visual and Aesthetic Resources	Qualitative rating (low-medium-high impact)	Medium	High	High	Medium
Noise	Number of properties affected before/after mitigation[e]	115 / 0	226–234 / 0	148–151 / 0	29–79 / 0
Vibration	Number of properties affected before/after mitigation	0 / 0	1-2 / 0	1-2 / 0	0 / 0
Parks and Recreational Resources	Resources affected	Interurban Trail, Scriber Creek Trail	Interurban Trail, Scriber Creek Park, Scriber Creek Trail	Interurban Trail, Scriber Creek Trail	Interurban Trail, Scriber Creek Trail
Section 4(f)	Resources involving a Section 4(f) use	None	Scriber Creek Park	None	None

[a] Only categories with noteworthy information, impacts or differences among alternatives are shown; Chapters 3 and 4 include full results.

[b] Range reflects contingencies for a conceptual level design. Figures rounded to the nearest $10 million.

[c] Ridership range reflects total boardings at this station, but adjusted to reflect ridership changes caused by additional station(s) in Segment A or B and their effect on ridership in this segment.

[d] Preferred Alternative, with optional stations in Segments A and B.

[e] Includes park-and-ride noise impacts.

[f] Includes option for added parking.

In other respects, including transportation performance, accessibility, and overall transit-oriented development, the Segment C alternatives would have similar effects.

5.3 Other Considerations

This section identifies other issues Sound Transit considered while planning and evaluating the benefits and impacts of the Lynnwood Link Extension.

5.3.1 Costs and Funding

Tables 5-2 through 5-4 list estimated capital costs of the alternatives. With seven alternatives in Segment A, four in Segment B, and four in Segment C, there are many possible segment combinations that could be linked to create the full 8.5-mile extension from Northgate to Lynnwood, with total costs ranging from $1.4 billion to $2.0 billion, depending on the alternatives selected in each segment. The Preferred Alternative would have total costs of $1.5 to $1.7 billion.

These estimates capture the cost differences of the essential features of alternatives for the purpose of comparison. The project cost estimates include:

- Construction costs for facilities, including the trackway/guideway, stations, and anticipated mitigation requirements
- Contingencies that address the varying levels of uncertainty and construction risk that have been identified for alternatives
- Right-of-way acquisition costs, including temporary construction easements
- Costs for design, permitting, agency administration, and program management

Because the project is still in conceptual planning, these estimates include substantial contingencies that recognize the uncertainty around some key factors that affect cost, such as WSDOT/FHWA design requirements, construction methods, mitigation measures, and market factors.

All of the light rail alternatives are estimated to cost about $16 million per year to operate and maintain, varying by several hundred thousand dollars depending on how many stations are included. Major operating costs include labor and benefits, electric power, insurance, and parts and equipment to run and maintain the trains, guideway, systems, and stations.

Project costs and revenues available to cover those costs were major considerations for the Sound Transit Board when it identified a Preferred Alternative for the Final EIS, which included four stations out of a possible six. However, the Board also requested further study of two stations as options for the Preferred Alternative. One of the purposes of the project is to support the implementation of the Sound Transit Long-Range Plan. The Long-Range Plan emphasizes cost-effective and efficient

transportation solutions, and it calls for a financially feasible system that is affordable to build, run, and use.

Sound Transit's financial plan currently includes $1.322 billion for this project (as indicated in Sound Transit's 2013 Transportation Improvement Program). Additional funding or cost reductions (including those that may be found through advanced design to reduce risk assumptions and related contingencies) would be needed for all of the alternatives.

Cost Tradeoffs

As noted, there are relatively small differences in operating costs among the alternatives. Capital cost differences are more pronounced; major cost tradeoffs among alternatives are summarized below.

Segment A: Seattle to Shoreline

A major cost driver in Segment A is the amount of guideway that is elevated, which is more expensive than at-grade. The Preferred Alternative and Alternatives A1, A5, and A10 place more of the guideway and at least one of their stations at-grade; however, they would require rebuilding three or four bridges that cross I-5. Alternatives A3, A7, and A11 elevate more of the guideway to cross over bridges to avoid the impacts of rebuilding them. The mostly elevated alternatives are $30 million to $80 million more expensive than the more at-grade alternatives because the cost of the elevated guideways and stations is higher than the cost of rebuilding the bridges.

The number of stations also affects costs. The Preferred Alternative and Alternatives A1 and A3 include two stations, while Alternatives A5, A7, A10, and A11 include three. The Preferred Alternative also has an option to add a third station at NE 130th Street. Including a third station adds $30 million to $50 million to the overall cost.

Segment B: Shoreline to Mountlake Terrace

There are several cost tradeoffs among the alternatives in Segment B. Converting the Mountlake Terrace Freeway Station for light rail use in Alternative B4 would cost $20 million to $30 million less than building a new elevated station in the Mountlake Terrace Transit Center in the Preferred Alternative and Alternatives B1 and B2A. North of 236th Street SW, crossing all the way over I-5 and then running on mostly elevated structures along the west side of the freeway (Preferred Alternative and B2A) would cost about $40 million more than crossing only to the median and then running at-grade in the median to Lynnwood (B1 and B4). Finally, adding a station near 220th Street SW in Alternative B2A would cost approximately $50 million or more, and an option to add a station for the Preferred Alternative would be similar.

Segment C: Mountlake Terrace to Lynnwood

The cost ranges in Segment C reflect the length of elevated guideway, property acquisition costs, and the cost for modifying existing transit facilities. All alternatives in this segment are elevated and each includes an elevated station near the existing Lynnwood Transit Center. The cost of the Preferred Alternative would be similar to Alternative C1. They both have longer guideways and more property acquisitions than the other two alternatives, costing up to $30 million more than Alternatives C2 and C3. Alternative C2, which has less guideway and less property acquisition, is the least expensive of the alternatives.

Funding

Sound Transit funds its facilities, services, and programs through a combination of revenue sources, including voter-approved sales, motor vehicle excise and rental car taxes, state and federal grants, passenger fares, and bond proceeds. The Lynnwood Link Extension is one project in the overall $17.8 billion ST2 system expansion program approved by voters in 2008. Since that approval, the recession has required Sound Transit to lower the revenue forecast through 2023 by 30 percent. Sound Transit has responded to the reduced revenue by taking steps to control costs and realign the ST2 program to ensure that the majority of the ST2 program, including the Lynnwood Link Extension, can be delivered by 2023. However, financial challenges remain. Sound Transit's financial plan has assumed that the agency would secure at least $600 million in funding from FTA's nationally competitive Capital Investment and Grant Program. This funding will be required to build any of the Lynnwood Link Extension alternatives. Sound Transit believes this project will compete well nationally. The agency has secured similar size grants in the past, receiving $500 million to help fund the initial segment of Central Link and another $813 million to help fund the University Link project.

5.3.2 Commitment of Resources

If built, the Lynnwood Link Extension would have irreversible and irretrievable commitments of property and natural resources.

For this project, private properties with residential and commercial uses would be converted to transit use. The use of the WSDOT right-of-way for the project would also be a commitment of resources that could affect the costs and impacts of future projects in the corridor, including potential projects involving environmental improvements, such as stormwater management or habitat restoration. While WSDOT and Sound Transit have been collaborating to develop this project in a way that maintains WSDOT's flexibility to make future improvements, the project would ultimately need to secure FHWA's approval to use highway lands, considering factors such as safety, transportation and environmental performance, maintenance, and potential future improvement needs. FHWA must approve the detailed design

plans for the project, which would include permanent facilities as well as construction traffic plans.

The conversion of public or private lands to light rail use would permanently alter visual quality and character along the project corridor. This would result in some visual impacts that would not be mitigated by replacement vegetation and landscaping that must mature to be effective. The project would affect wetlands, wildlife habitat, aquatic resources, and highway beautification areas to varying degrees, depending on the alternative built. Mitigation measures would be employed, but some of these resources would be irretrievably altered.

Building the project also would irretrievably commit resources such as fuel and construction materials (e.g., aggregate for concrete, wood for forms and frames, and steel for rebar).

5.3.3 Benefits and Disadvantages of Delaying Project Implementation

As required under SEPA (WAC 197-11-440), Sound Transit has evaluated the benefits and disadvantages of delaying the project, compared with moving forward with it as planned.

If Sound Transit delays construction, this would temporarily avoid the long-term and construction-related environmental consequences associated with the project. Other long-term impacts such as visual impacts also would be delayed. Delays in acquiring properties could be seen as a benefit because property owners could reside on their property longer, but this could also create burdens on property owners or tenants, particularly if the project delays the acquisition and relocation processes. Delay in acquiring property also could make the acquisitions more expensive for Sound Transit.

The primary disadvantage of delaying the project would be the failure to address the growing transportation needs of the corridor communities and the region. Sound Transit and PSRC transportation plans, as well as the long-range planning, growth management, and economic development plans of the project corridor communities (see Section 4.2, Land Use) emphasize the need for a transportation alternative in the face of growing congestion along this major corridor.

A substantial delay in implementing the Lynnwood Link Extension would impair the region's ability to accommodate its projected growth in travel demand, population, and employment. The current high levels of congestion and unreliability for travelers in the I-5 corridor would worsen because travel demand is expected to continue growing. Increasing congestion would continue to degrade bus transit service. Increased traffic congestion could affect future economic development in the region because it could increase the cost of doing business, including costs for lost productivity and wasted

fuel. Increased business costs would make the project corridor communities comparatively less attractive as places to live or do business.

Finally, delays in addressing this transportation problem could change planned development patterns, leading to less dense development and lost opportunity to create transit-supported communities. This could hamper economic growth, worsen environmental conditions, and negatively affect the regional quality of life.

5.3.4 Areas of Controversy and Issues to be Resolved

Public and agency comments suggest limited project-related controversy in most areas. However, during the Draft EIS public review and comment period, Sound Transit and FTA received several hundred comments about potential impacts to the Seattle Latvian Evangelical Lutheran Church, which would have been relocated by some of the Segment A alternatives. The church, individuals, community organizations, and representatives of Latvia asked Sound Transit to explore additional options to avoid impacting the church. Following issuance of the Draft EIS and public comments, Sound Transit developed designs to realign a section of 3rd Avenue NE, which would maintain access to the church and avoid the need to relocate the church or its community hall.

Also in Segment A, two of the alternatives (A5 and A7) would include a station at NE 155th Street, which the City of Shoreline opposed in its comment letter during environmental scoping.

The Edmonds School District also has concerns about potential impacts to District properties. One of the Segment B alternatives (the 220th Street Station option for the Preferred Alternative), would affect the former Melody Hill School site. The District has plans to sell the site for other development. In Segment C, Alternatives C2, C3, and the Preferred Alternative would cross a District property that is to be developed as a bus base and district operations center. The District's comment letter on the Draft EIS stated concerns about any alternatives that would conflict with the development plans for the property, but also supported a City of Lynnwood proposal to modify Alternative C3. The Preferred Alternative now features several elements of that proposal, as refined by Sound Transit in coordination with the City and the District.

Public comments on the Draft EIS also highlighted impacts to Scriber Creek Park in Segment C, which many commenters and the City of Lynnwood described as particularly valued for its natural characteristics. Alternative C1 was the most criticized, followed by Alternative C2. FTA has determined that a Section 4(f) use would occur with Alternative C1 due to its impacts on Scriber Creek Park, and therefore other alternatives that avoid the use must be considered instead. The EIS includes proposed measures to mitigate impacts should Alternative C2 be selected. The Preferred Alternative and Alternative C3 would not impact Scriber Creek Park.

Alternatives C1 and C2's acquisition and relocation impacts to businesses and/or residents were also frequent topics in public comments on the project.

The City of Lynnwood and the Edmonds School District opposed the Lynnwood site alternative for Sound Transit's OMSF, which is a separate project that would support light rail operations and maintenance needs for the ST2 program of projects, including the Lynnwood Link Extension and the East Link Extension. In July 2014, Sound Transit identified a site in Bellevue as the Preferred Alternative for evaluation in the Final EIS, along with other alternatives. A final decision on the OMSF site will be made after the Final EIS is issued for that project in summer 2015.

Issues yet to be resolved relate to agreements that Sound Transit must secure from WSDOT and FHWA to use parts of the I-5 right-of-way permanently as well as during construction. In addition to needing approvals for the use of the right-of-way, Sound Transit would need approvals for modifying any I-5 interchange or other parts of the freeway, such as shoulders or existing noise walls; for constructing staging and access; for implementing any lane closures affecting the interstate highway; and for conducting any modifications that could affect highway operations or safety. Most of these approvals would occur during final design. Sound Transit has coordinated with FHWA and WSDOT to develop conceptual engineering definitions for the alternatives, but as final design progresses, FHWA or WSDOT could request modifications or place other restrictions on the project. Sound Transit has worked successfully with WSDOT and FHWA to obtain approvals for right-of-way use for other Sound Transit projects, but it would affect the project costs, construction impacts, and work schedule if Sound Transit is not able to use the right-of-way as anticipated in the current design of the alternatives.

As noted above in Section 5.3.1, project funding also remains an issue to be resolved. Sound Transit is proposing the project as a candidate for FTA's New Starts grants program. Recent legislation has changed some of the requirements for the program and its long-term funding levels are not known.

Potential stations at NE 130th Street, NE 155th Street, and 220th Street SW were not evaluated in the ST2 planning process, which analyzed ridership and cost for each station, and are not currently included in the ST2 Plan. Consistency with the ST2 Plan would need to be further evaluated before any of these stations could be added to the Lynnwood Link Extension.

6 PUBLIC INVOLVEMENT AND AGENCY COORDINATION

Public involvement and agency coordination activities are important components of the NEPA/SEPA environmental process.

Sound Transit and the FTA are providing ongoing opportunities for all those interested in the Lynnwood Link Extension to be involved, get information, ask questions, and give comments. Sound Transit and FTA have a formal Coordination Plan with specific elements for agency and tribal outreach and public involvement. The Coordination Plan is summarized in this chapter and the project's public involvement, agency, and tribal coordination activities are further defined.

The public involvement and agency coordination effort for what is now the Lynnwood Link Extension began in October 2010, when FTA and Sound Transit began early scoping for the North Corridor Alternatives Analysis. They issued public notices in the Federal Register and SEPA Register, advertisements and legal notices in local newspapers, postcard mailings, and email messages. They held three public meetings (one each in Seattle, Shoreline, and Lynnwood) and one agency meeting during the early scoping period. FTA and Sound Transit requested the public to submit suggestions about the transportation problems of the project corridor and to propose a broad range of potential transit solutions. See the *Alternatives Analysis Report and SEPA Addendum* (September 2011), in Appendix K, Supporting Documents, for more information about the Alternatives Analysis, which led to the alternatives evaluated in this Final EIS, and its public involvement and agency coordination. The scoping phase for the Draft EIS for the Lynnwood Link Extension started September 30, 2011, as discussed in Section 6.2.1.

6.1 Coordination Plan

The public involvement, agency coordination, and tribal coordination efforts outlined in the project's Coordination Plan cover activities from the Alternatives Analysis process through the Final EIS. These efforts also comprise agency and tribal coordination and outreach that Sound Transit formally initiated when the project began environmental scoping for the Draft EIS. This process has continued through the release of the Draft EIS, the subsequent public comment period, and the development of the Final EIS. The Coordination Plan provides a structured approach to public outreach for the project team throughout the EIS process.

The Coordination Plan also includes strategies for outreach to traditionally hard-to-reach populations, such as minority, low-income, and low-English proficiency populations. The plan aims to identify and involve minority and low-income populations that the project could benefit or affect adversely. Sound Transit and FTA recognize it is important to try to reach all people potentially affected by the project.

6.2 Public Outreach Activities and Methods

The project's outreach activities have continued throughout the environmental review process, which culminates with the release of the Final EIS, Sound Transit Board's selection of the project to be built, and FTA's issuance of a Record of Decision. Some activities have occurred at specific project milestones, such as the publication of the Draft EIS, while other types of activities have been conducted on an ongoing basis, such as targeted community outreach. The following subsections summarize the outreach activities and methods used or planned during the project's environmental process. A detailed list of all the public outreach activities conducted to date, including public meetings and hearings, is provided in Appendix L, Public Involvement and Agency Coordination.

6.2.1 Scoping

Sound Transit and FTA conducted early scoping for an Alternatives Analysis beginning in October 2010. Following the release of the Alternatives Analysis report, Sound Transit conducted formal public scoping. Scoping supports the environmental review process requirements of NEPA and SEPA. The scoping process began with the public notice of the intent to prepare an EIS in the Federal Register on September 29, 2011, and in the SEPA Register on September 30, 2011. The formal notices were accompanied by advertisements and other public notices and outreach materials. Scoping notice postcards were sent to 103,000 addresses, and emails were sent to 1,000 email addresses. During the scoping period, Sound Transit and FTA asked the public to comment on the proposed Purpose and Need Statement, the environmental issues to be evaluated in the Draft EIS, and alternatives to be considered for evaluation in the Draft EIS.

To provide project information to the public during scoping, Sound Transit produced the following documents and made them available on the project Web site (http://www.soundtransit.org/lle) and at public meetings (all are part of Appendix K):

- *Scoping Information Report:* This summary of the environmental scoping effort provides a planning history of the project, the results of the Alternatives Analysis, the draft Purpose and Need Statement, the range of alternatives being considered for study in the Draft EIS, the potential environmental topics to be reviewed in the Draft EIS, and the project schedule.
- *Coordination Plan*: This plan is a summary of the efforts to engage the public, agencies, and tribes throughout the environmental review process. This plan was then finalized after the public scoping period ended, and was updated following the release of the Draft EIS.
- *Alternatives Analysis Report and SEPA Addendum*: This is a summary document and complete technical report describing the initial study Sound Transit

conducted to define the most promising alternatives for further review in the Draft EIS, along with alternatives to be dropped from further consideration.

During the 30-day scoping period, Sound Transit and FTA held public meetings in Seattle, Shoreline, and Lynnwood, and an agency meeting in Shoreline. They received 69 comment submittals from individuals, 14 from jurisdictions and agencies, and three from organizations. The comments received during scoping were provided to the Sound Transit Board for consideration before the Board identified the alternatives for analysis in the EIS. The *Environmental Scoping Summary Report* (Sound Transit 2011f) summarizes all the comments received during scoping. Table 6-1 provides further details on the scoping meetings (including early scoping).

Table 6-1. Public, Agency, and Tribal Scoping Meetings

Scoping Meetings	Dates	Number of Attendees
Public	October 7, 12, and 14, 2010	200 people
Agency and Tribal	October 14, 2010	9 agencies
Public	October 11, 13, and 18, 2011	185 people
Agency and Tribal	October 11, 2011	13 agencies

The majority of the comments Sound Transit and FTA received were positive. All the jurisdictions, agencies, and organizations that provided written comments either supported the proposed project or offered advice on the project's next steps into the environmental process. None were opposed.

Seven of the agencies and jurisdictions specifically indicated support for an I-5 alternative, as did all of the organizations that commented. Several agencies voiced concerns about an SR 99 alternative's impacts, costs, ridership, or ability to meet other purpose and need objectives. Most of the individual public comments supported the proposed project or one or more of the light rail alternatives. Several agencies suggested additional sites or options, including stations at NE 130th Street, NE 155th Street, and 200th Street SW. Three of the individual public commenters were opposed to the proposed project, including one who preferred bus rapid transit instead of light rail. The other comments varied, but included suggestions about environmental or land use factors, and the purpose and need for the project. A number of commenters asked Sound Transit to move ahead quickly to build the project.

6.2.2 Tech Talk

Tech Talk was an informal, lunch-hour outreach activity during the scoping period on October 7, 2011, and during the Draft EIS comment period on September 13, 2013. Project managers provided information about the project and answered questions online. Participants accessed the broadcast by going to video.soundtransit.org. The videos of the broadcasts are on the project Web site.

6.2.3 Public Meetings, Open Houses, Briefings, and Workshops

In addition to scoping meetings, Sound Transit has held public meetings, open houses, and workshops to present project information and solicit comments from the public. The format typically included time for the public to view project information and to speak with project team members one-on-one. Appendix L lists all public meetings and briefings for the project to date. Sound Transit has continued to hold these public events as the project progressed through the EIS process.

Sound Transit also regularly provides briefings to neighborhood associations, organizations, and businesses located within the project vicinity to provide project information and to answer questions. Briefings typically include a presentation by project staff and an opportunity for questions and answers.

6.2.4 Community Events

Sound Transit representatives have attended various community events planned by other organizations to reach community members who might not otherwise seek out information about the Lynnwood Link Extension. These events, which included street and community fairs and festivals such as Cinco de Mayo celebrations in corridor communities and nearby towns, proved to be an effective way for Sound Transit to reach new people interested in the project. With booths and staffed tables at the events, Sound Transit representatives talked to the public about the project, helped them sign up for the project mailing list, and informed them of other ways to be involved. Sound Transit reached several thousand people in this way, beginning with outreach during the project's early planning, continuing on through public scoping, and throughout the development and release of the Draft and Final EIS documents.

In 2011, in support of early scoping and the Alternatives Analysis, Sound Transit attended eight events, engaging more than 1,100 community members; in 2012, the year EIS scoping and EIS alternatives were being identified, Sound Transit attended eight events, engaging more than 830 people in the community; in 2013, the year the Draft EIS was released, Sound Transit attended six events, engaging nearly 650 community members. In 2014, as the Final EIS and additional engineering studies were being completed, Sound Transit attended seven events, engaging nearly 700 people. Appendix L lists the community events that Sound Transit has attended.

6.2.5 Drop-in Sessions

In March 2012, Sound Transit held 10 drop-in sessions along the project corridor in Seattle, Shoreline, Mountlake Terrace, Edmonds, and Lynnwood at various public locations, such as community centers, grocery stores, and libraries. These sessions were advertised by postcards inviting people to drop in at the locations to talk to

staff, learn more about the project, and provide additional feedback prior to the Sound Transit Board identifying the alternatives included in the Draft EIS. Sound Transit staff members spoke with approximately 450 people during these sessions.

In June 2014, Sound Transit held four drop-in sessions along the project corridor at the Northgate Community Center in Seattle and the public libraries of Shoreline, Mountlake Terrace, and Lynnwood. These sessions were advertised by postcards, inviting people to drop in at the locations to talk to staff and learn more about the project, including the Preferred Alternative considered in this Final EIS. Sound Transit staff members spoke with approximately 250 people during these sessions.

6.2.6 Project Web Site

The project has a Web site (www.soundtransit.org/lle) that provides current project information, including project maps, schedule, and project-related documents, which Sound Transit updates regularly. The Web site is also a document archive and includes a video animation of the Preferred Alternative, which has been viewed often by Web site visitors.

6.2.7 News Media

At times, Sound Transit uses local newspapers to inform, educate, and involve the public. News releases and advertisements for public meetings are sent to newspapers in the project vicinity.

6.2.8 Fact Sheets, Brochures, and Newsletters

Fact sheets and brochures are often distributed at public meetings, workshops, and community events. The purpose of the fact sheets and brochures is to concisely provide project updates. Newsletters were mailed and emailed in April 2011 (emailed only), June 2012, March 2013, January 2014, and June 2014 to provide project information and updates. In addition, annual project updates were sent to email subscribers.

6.2.9 Email Subscription List

Sound Transit maintains an email subscription list of people who have expressed interest in the project, or who have requested project information, and provides periodic project updates and e-newsletters to subscribers. At the close of September 2014, there were 3,318 subscribers to the email subscription list.

6.2.10 Kiosks

Sound Transit rotates three project information kiosks throughout the corridor with updated project information for residents and environmental justice populations (see Section 6.2.13 Environmental Justice Coordination), typically at public libraries, community centers, or community colleges within the project corridor. They were first displayed in December 2012, and will continue to be displayed up to final

design, at which point Sound Transit will evaluate whether kiosks are still an effective way to provide the community with project updates. The kiosks have displayed the early planning area; announced public meetings, hearings, and comment periods; advertised the availability of the Draft EIS; and provided information about the Preferred Alternative. They are always stocked with the most recent newsletter. To increase exposure, they are relocated based on the number of project information sheets that were taken by the public. They include a short statement in several different languages inviting non-English speaking community members to contact Sound Transit for more information. Languages include Vietnamese, Tagalog, Spanish, Korean, Chinese, and Amharic.

6.2.11 Fieldwork Outreach

Sound Transit provided advance notice to property owners and residents prior to geotechnical work, vibration and noise testing, and topographical surveys during the spring and early summer of 2014. Recognizing that some of this work would be out of the ordinary in residential areas when large equipment is in operation with potential noise and vibration effects, the purpose of the outreach was to:

- Alert potentially affected residents and businesses, especially property owners who had already signed Right of Entry agreements
- Inform the public where they can find additional information
- Reduce surprises associated with this work
- Comply with permitting agencies' notification requirements (as applicable)

Sound Transit notified the public about upcoming field work through telephone calls to known property owners and hand-distributed flyers. They also placed fieldwork activity information in other project-related materials, including a spring newsletter, information kiosks, e-updates, and the project Web site.

6.2.12 Property Owner Outreach

Starting in 2013, Sound Transit used the following ways to reach out to property owners who could have some or all of their property acquired:

- Before the Draft EIS, Sound Transit mailed notification letters to property owners letting them know their property could be affected. The letters invited potentially affected property owners to contact Sound Transit staff to set up a meeting to learn more about the potential effects. The first set of notification letters was mailed in June 2013, the month before publication of the Draft EIS. Subsequent mailings occurred in February and March 2014, following further design modifications to the Preferred Alternative.
- Sound Transit met with potentially affected property owners in person, at their request. A group meeting included residents of Cedar Creek Condominiums and Northgate West Condominiums. Sound Transit also

met several times with representatives of the Seattle Latvian Evangelical Lutheran Church, including once with the greater church community.

- Sound Transit consulted individuals by telephone at their request, including potentially affected property owners, and non-affected property owners concerned that their properties would be acquired.
- Sound Transit added potentially affected property owners to the project's mailing list to receive the Winter 2014 newsletter and the announcement of the Sound Transit Board's recommendation of the Preferred Alternative. An electronic version of the newsletter was also sent to the email recipients on the subscription list. Throughout the notification process and individual meetings, property owners have submitted their email addresses and signed up to the project's email subscription list for project updates.
- Sound Transit contacted property owners for right-of-entry approval prior to geotechnical work, vibration and noise testing, and topographical surveys (see Section 6.2.11, Fieldwork Outreach). Sound Transit will continue to communicate with potentially affected property owners as it refines the design of the proposed alternatives. It will update property owners after key milestones, such as the Sound Transit Board's selection of the project to be built, and the completion of final designs.

6.2.13 Environmental Justice Coordination

At the start of project outreach activities in late 2010 and again in 2011 and 2013, Sound Transit worked to better understand demographic and community characteristics in the corridor, with a particular focus on low-income and minority populations. Stakeholder interviews helped the agency identify community organizations in the project corridor that were likely to represent or provide services to minority and low-income individuals. The resulting environmental justice population outreach activities conducted for the project are summarized in Section 4.4, Social Impacts, Community Facilities, and Neighborhoods, and Appendix C, Environmental Justice Analysis. Some examples of Sound Transit's targeted outreach are:

- Publication of the environmental scoping notices in *La Raza*, *Korean Daily*, *Seattle Chinese Times*, *Russian World Newspaper*, *Seattle Chinese Post*, and *tu Decides*.
- Project staff attendance at Cinco de Mayo festival events to hand out project materials translated into Spanish and a Spanish interpreter present to translate.
- Project posters distributed to several organizations that serve minority and low-income populations in the project corridor.

Sound Transit's environmental justice outreach activities to date are summarized in Table L-1 in Appendix L.

6.3 Agency Coordination

In addition to the public meetings and hearings to which agencies are invited, Sound Transit coordinates with agencies via periodic meetings designed to gather input. These meetings are either policy- or technical-related, depending on the topic of discussion. The participating and cooperating agencies with which Sound Transit has been coordinating for the proposed project are listed in Table 6-2.

Table 6-2. Participating and Cooperating Agencies

Cooperating Agencies[a]	Participating Agencies[b]
Federal Highway Administration	U.S. Department of Interior
Washington State Department of Transportation	U.S. Fish and Wildlife Service
U.S. Army Corps of Engineers	U.S. Environmental Protection Agency
City of Edmonds	National Oceanic and Atmospheric Administration
City of Lynnwood	Homeland Security/Transportation Security Administration
City of Mountlake Terrace	Advisory Council on Historic Preservation
City of Seattle	Federal Emergency Management Agency
City of Shoreline	Federal Railroad Administration
King County	National Park Service
Snohomish County	Seattle City Light
	Snohomish County Public Utility District
	Washington Department of Archaeology and Historic Preservation
	Washington Department of Fish and Wildlife
	Washington State Department of Ecology
	Puget Sound Regional Council
	Puget Sound Clean Air Agency
	Community Transit
	Everett Transit
	City of Mill Creek

[a] A cooperating agency is any federal agency, other than a lead agency, that has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposed project or project alternative (40 CFR 1508.5).

[b] A participating agency is any agency with an interest in the project (23 USC 139(d)).

Sound Transit has been coordinating project planning with many of the agencies since the Alternatives Analysis. For several years, FHWA and WSDOT have been involved in the development and review of alternatives affecting I-5 or the use of I-5 right-of-way, and they have participated in technical reviews of the preliminary Draft and Final EIS documents. Local jurisdictions and other cooperating agencies have been similarly involved since the project's inception.

6.4 Tribal Coordination

Sound Transit contacted the following federally recognized tribes that have treaty rights, cultural resources, or other interests in the project area:

- Muckleshoot Indian Tribe
- Snoqualmie Tribe
- Stillaguamish Tribe of Indians

- Suquamish Tribe
- Tulalip Tribes
- Yakama Nation

FTA initiated government-to-government consultation with the affected tribes and invited them to become participating agencies. FTA and Sound Transit will continue to consult with the tribes regarding potential natural and cultural resources impacts. In compliance with the Historic Preservation Act, Sound Transit also contacted the Duwamish and Snohomish tribes, which are not federally recognized but have interests in cultural resources in the region.

6.5 Draft EIS Comment Period

Sound Transit published the Notice of Availability of the Draft EIS in the Federal Register and SEPA Register. The public comment period for the Draft EIS ran from July 26, 2013 to September 23, 2013 and included four public open houses and public hearings:

- August 14, 2013 — Nile Shrine Golf Center, Mountlake Terrace
- August 20, 2013 — Northgate Community Center, Seattle
- August 21, 2013 — Embassy Suites, Lynnwood
- August 22, 2013 — Shoreline Conference Center, Shoreline

In addition to the Federal Register and SEPA Register notices, Sound Transit advertised the comment period through mailed postcards, emails, community calendar postings, and online and print display advertisements.

Sound Transit collected written comments on the Draft EIS via mail, email, comment forms, and court reporter transcriptions of oral comments made during public hearings. Sound Transit received 634 comment documents (written, email, and hearing transcripts) during the comment period from agencies, tribes, and public. They were reviewed by Sound Transit and FTA, and considered during development of this Final EIS.

Chapter 7, Draft EIS Comments and Responses, discusses the public outreach and involvement process leading up to the release of the Draft EIS and summarizes the comments received. Appendix P, Draft EIS Public Comments and Responses, provides Sound Transit's and FTA's response to each substantive comment received.

Preferred Alternative

Based on information in the Draft EIS, and comments from the public, agencies, and tribes, the Sound Transit Board, in Motion M2013-96, identified a Preferred Alternative in November 2013 for evaluation in the Final EIS. Motion M2013-96 also directed Sound Transit to further evaluate potential modifications and options

for the Preferred Alternative and other alternatives, as described in Chapter 2, Alternatives Considered. Sound Transit conducted further public outreach and communication about the Preferred Alternative. This outreach included emails to those on the project email list, social media, a newsletter, updates on the project Web site, drop-in meetings, and booths or kiosks in community centers and gathering places in the corridor where staff, handouts, and displays provided updates.

6.6 Final EIS, Sound Transit Board Action, and the Federal Record of Decision

The Final EIS is one of the final steps in the NEPA and SEPA process before FTA and Sound Transit decide whether to take further action on the project. This Final EIS was released with a notice of availability published in the Federal Register, advertised in the *Seattle Times* and other publications, and with written notice to all parties that commented during scoping or in the review of the Draft EIS. Distribution of the Final EIS in written and electronic form mirrors the distribution used for the Draft EIS.

The Sound Transit Board, following the Final EIS release, will select the project to be built. After the Board takes action, FTA is anticipated to issue a Record of Decision in accordance with NEPA. At that point, Sound Transit would move forward with securing federal funding, completing final design, obtaining permits, starting construction, and then moving into operations. Other federal, state, and local agencies, such as FHWA, WSDOT, the U.S. Army Corps of Engineers, and the corridor cities will also be asked to take action on permits and approvals and may rely on this Final EIS to support their decisions. See pages iv-v of the Summary for a list of approvals that the project is expected to need.

7 DRAFT EIS COMMENTS AND RESPONSES

This chapter summarizes the agency, tribe, and public comments Sound Transit and FTA received during the 60-day public comment and review period following the release of the Draft EIS for the Lynnwood Link Extension on July 26, 2013.

A Draft EIS Public Comment Summary Report was prepared for the Sound Transit Board and FTA following the public comment period, and posted on the project Web site. Based on its review of the Draft EIS, and comments received from the public, agencies, and tribes, the Sound Transit Board identified a Preferred Alternative for evaluation in this Final EIS, along with other alternatives. All of the comments received are in Appendix P, Draft EIS Public Comments and Responses.

7.1 Overview of the Draft EIS Comments

Sound Transit and FTA received 634 comment submittals from the public (individuals), agencies, tribes, businesses, and organizations. The comment tallies in Table 7-1 include the spoken comments made at the public hearings, as well as written comments. Some of the written comments came in the form of petitions, including one that had been posted online and endorsed by more than 1,800 people.

The two most common topics were the impacts to the Seattle Latvian Evangelical Lutheran Church and Community Center in Seattle in Segment A, and to Scriber Creek Park in Lynnwood in Segment C.

Most of the other comments focused on a preference for one or more of the light rail alternatives or station locations, but many people also had specific comments on potential environmental issues discussed in the Draft EIS. These topics notably concerned acquisitions, displacements, and relocations; ecosystem resources; transportation; noise and vibration; visual and aesthetic resources; social impacts, community facilities, and neighborhoods; and parks and recreational resources.

Table 7-1 shows the number of comments Sound Transit and FTA received by commenter type during the comment period.

Table 7-1. Comment Submittals Received by Commenter Type

Commenter Type	Number
Federal Agency	5
Tribe	1
State or Regional Agency	4
Local Agency	15
Businesses	8
Organizations or Groups	46
Individual	555

7.2 Comments from Agencies and Tribes

Three federal agencies provided brief comments on the project but generally did not endorse specific alternatives. Four state agencies commented, including WSDOT. The local agencies, including all cities along the corridor, wrote to support the light rail extension and indicated preferences for specific alternatives. They also had comments about areas of environmental concerns and mitigation. Table 7-2 lists the agencies and tribes that provided comments to Sound Transit and FTA.

Table 7-2. List of Agencies and Tribes Providing Comments

Federal Agencies	Local Agencies and Jurisdictions
U.S. Army Corps of Engineers	Alderwood Water & Wastewater District
U.S. Department of Interior	Community Transit
U.S. Environmental Protection Agency	Edmonds School District
Other Governments	King County Department of Transportation
Ambassador of the Republic of Latvia	City of Lake Forest Park
Tribes	City of Lynnwood
Muckleshoot Indian Tribe	City of Mountlake Terrace
State Agencies	City of Seattle
Department of Archaeology and Historic Preservation (DAHP)	City of Shoreline
University of Washington's Department of Scandinavian Studies	City of Shoreline Fire Department
Washington State Department of Ecology	Puget Sound Regional Council (PSRC)
Washington State Department of Transportation	

7.2.1 Federal Agencies

The letter from the U.S. Army Corps of Engineers had no comments on the Draft EIS, but noted potential wetland impacts that would require its involvement during the project's permitting phases.

The U.S. Department of Interior sent a letter indicating no major comments, but subsequently amended the letter to note that two park properties, Twin Ponds Park in Shoreline and Jack Long Park in Mountlake Terrace, were developed with Land and Water Conservation Funds, and should be protected from transportation impacts. It noted that the NE 155th Street Station option with Alternative A5 (and Alternative A7) has the potential to affect Twin Ponds Park if transit users parked there for commuting purposes.

The EPA wrote in support of the overall project and its potential to provide environmental benefits, but expressed concerns about alternative alignments in Segments B and C that would affect aquatic or wetland resources or park properties. It asked for further information to be developed for the Final EIS, but also stated it had no major objections to any of the Segment A alternatives, or to Alternatives B1, B4, or C3. EPA recommended that the Final EIS include:

- A 404(b)(1) comparative alternatives analysis of wetlands impacts, particularly for Segments B and C
- More detail on Alternatives C1 and C2 construction and operation impacts to Scriber Creek Park and the Scriber Creek wetland complex
- Identification and listing of land purchase funding sources as well as use restrictions applied to parks and natural areas that would be affected by the proposed project
- Effects on ecological connectivity, including restoration options
- More detail on cumulative impacts to Scriber Creek Park and wetlands from the Lynnwood alternative for the OMSF
- Information about parking supply during construction

7.2.2 Tribes

The Muckleshoot Indian Tribe thanked Sound Transit and FTA for addressing its previous concerns, and added the following comments:

- Prefer Alternative C1 because it would have the fewest impacts on Scriber Creek and Swamp Creek tributary, associated wetlands and floodplain, and thus fewer impacts to salmon and salmon habitat
- Include Muckleshoot Indian Tribe Fisheries Division on state-owned culvert replacement projects (due to recent federal court decisions related to tribal involvement for such projects)
- Prefer enhanced treatment methods for stormwater water quality treatment to maximize removal of heavy metals and oils that may otherwise adversely affect salmon

7.2.3 State Agencies

WSDOT submitted a comment letter thanking Sound Transit for the cooperative planning to date. It noted the importance of keeping WSDOT's freeway management systems operational throughout construction (CCTV, Variable Message Signs, data station, ramp meters, etc.). WSDOT emphasized the need for effective multimodal access to stations. It also cited visual impacts as a key concern, and that WSDOT believed some areas had higher visual impacts than the Draft EIS stated. It asked Sound Transit to further explore mitigation measures and minimize the loss of vegetation, particularly large trees.

DAHP submitted a comment letter concurring with the Draft EIS preliminary finding that the project would have no adverse effect to historic resources.

Ecology wrote in support of alternatives that avoid and minimize impacts to wetlands and streams in the project corridor, such as Alternative C1 or C3, which reduce impacts to the Scriber Creek wetland complex. Ecology also submitted technical comments on the ecosystems and water resources sections of the Draft EIS.

The University of Washington's Department of Scandinavian Studies submitted a letter to express concern for the future of the Latvian Community Center (located at the Seattle Latvian Evangelical Lutheran Church), stating that the Department uses the Latvian Community Center to hold activities and events.

7.2.4 Regional and Local Agencies and Jurisdictions

PSRC wrote a letter concurring with the Draft EIS findings that the project would generally be consistent with regional planning documents. PSRC asked Sound Transit to provide more comparative detail on the transit-oriented development potential of various station alternatives. PSRC also asked Sound Transit to include station access data by mode and to show how those different modes contribute to potential ridership.

The letter from the King County Department of Transportation focused largely on Segment A alternatives. It emphasized station access issues, including the need for connecting transit service and nonmotorized travel options, combined with transit-oriented development in lieu of park-and-rides. Additionally, the King County Department of Transportation suggested the EIS acknowledge future tolling and other transportation demand strategies.

The letter from King County specifically supported Alternative A10 or A11, which include stations at NE 130th Street and NE 145th Street. It favors the NE 130th Street Station because it would capitalize on the strong ridership projections, provide more efficient local bus connections, and provide good nonmotorized access. It also supported a NE 145th Street Station, but asked for further study of lower parking capacity there because of congestion problems, with potentially more spaces at

NE 185th Street. King County also suggested a non-median station at Mountlake Terrace (with suggested design modifications) to allow continued transit use of the existing freeway stop by Sound Transit and Community Transit during light rail construction. King County also provided comments from its paratransit service division focusing on ADA-accessible facilities.

The City of Seattle supported the Alternative A1 alignment, but they preferred a station at NE 130th Street as shown on Alternative A5/A10 (Option 1), with no parking at NE 130th Street. The preference for the A1 alignment included specific comments on the following topics:

- Reducing impacts to the Seattle Latvian Evangelical Lutheran Church by maintaining its right-of-way access
- Reconstructing NE 130th Street off-ramp to address a high accident location
- Retaining trees on the east side of 1st Avenue NE between 113th Street and 115th Street
- Retaining strong existing
- connections and opportunities to provide improved bicycle and pedestrian facilities if 1st Avenue NE and the 117th Street bridge are reconstructed
- Including sidewalks and a bicycle lane on the west side of 5th Avenue NE between NE 130th Street and NE 145th Street

The City of Seattle's comments on the NE 130th Street Station (Alternative A5/A10, Option 1) suggested the station would expand access to the regional transit system. This station would have an average weekday ridership of 3,200 compared to 2,200 average weekday riders at the NE 145th Street Station, and would provide a unique opportunity for bus, bicycle, and pedestrian access.

The City of Mountlake Terrace supported the light rail project and noted the City's support for transit-oriented development. Although the City stated Alternative B1 was acceptable, the City prefers Alternatives B2 and B2A because they would provide the greatest opportunity for transit-oriented development. The City does not favor Alternative B4 because it is least supportive of transit-oriented development.

The City of Shoreline wrote a detailed comment letter that expressed excitement about the extension of light rail to Shoreline. The City identified NE 145th Street (Option 2) and NE 185th Street (Option 1) as the best locations for stations; the letter also provided details on the planning the City is doing in support of these stations. The City also noted that the NE 155th Street Station was not preferred because it would have higher impacts and less effective access. The City recommended a mostly at-grade alignment, and stated its interest in continuing to work with Sound Transit on project planning and design, especially in station areas

to ensure effective multimodal access. A letter attachment detailed further technical comments on the Draft EIS, including transportation-related issues at the station sites, as well as visual, ecosystem, land use, public safety and security, and utility impacts and issues.

The City of Lynnwood supported bringing light rail to the Lynnwood Transit Center, and proposed an alternative configuration, "C3 Modified," which it preferred over the alternatives in the Draft EIS. Alternative C3 Modified would be between Alternatives C2 and C3. The following are the City's key comments:

- Traffic impacts will be worse than presented in the Draft EIS
- A separate analysis is needed for the OMSF as an independent project
- The expectation that 80 percent of riders will arrive by bus is optimistic
- Alternative C3 could limit future development potential in areas slated for the highest density development in the Lynnwood regional growth center, particularly the City Center block located east of 44th Avenue West.

The City of Lake Forest Park wrote in support of light rail on the east side of I-5 in Segments A and B, and supported stations at NE 145th Street and NE 185th Street.

The letter from the Edmonds School District supported either Alternative B2 or B2A. The letter also supported the City of Lynnwood's C3 Modified alternative. The Edmonds School District asked to participate in the engineering and planning process for the Segment C alternatives because these alternatives would affect their property.

The letter from the Alderwood Water & Wastewater District requested that Sound Transit work with the District to ensure water supply is maintained in the vicinity of I-5 and the Interurban Trail.

The letter from the Shoreline Fire Department supported the NE 145th Street Station. The Fire Department is concerned that a NE 155th Street Station would interfere with its fire station operations.

Community Transit's letter supports the project. The agency expressed its intent to serve Link light rail stations in Snohomish County. The detailed comments focused on proposed mitigation measures to preserve mobility during construction, as well as system design elements that will enable effective bus-rail integration. Community Transit prefers Alternative C1 and Alternatives B1 and B2. Community Transit agrees with the comments provided by King County Metro's paratransit service, requesting that the station design maximize accessibility for all patrons.

7.3 Comments from Businesses

Sound Transit received eight comment letters from businesses within the project area:

- Cairncross & Hempelmann
- Cascade Trophy
- JC Auto Restoration
- Mayes Testing Engineers, Inc.
- Mike Raskin
- Mortgage Capital Associates
- Mullally Development Company
- Simon Property Group

Simon Property Group, the company that owns Northgate Mall, submitted a detailed letter from its attorneys outlining concerns about the cumulative effects of the Lynnwood Link Extension, Northgate Link Extension, and King County's plans for transit-oriented development south of the mall. The letter described concerns about mall traffic access, visibility of the mall for customers coming from I-5 and 1st Avenue NE, traffic on arterials and local streets near the mall, and parking—both parking for mall patrons and exacerbation of existing "hide and ride/park" problems.

The Mullally Development Company, owner of the Northgate Plaza Apartments, does not believe the Draft EIS fully takes into account the project's impacts on their property. They have concerns about the access to their property (they would like a more complete discussion of access during construction), and noise and vibration impacts. They prefer Alternative A1, and do not agree with the conclusion that the Northgate Plaza Apartments are eligible for listing on the NRHP.

Sound Transit received a letter from Cairncross & Hempelmann, a law firm representing several unnamed local, national, and international real estate developers constructing and/or planning transit-oriented development projects adjacent to future Sound Transit light rail stations. The law firm provided its assessment of the potential for transit-oriented development in the corridor by alternative, and supported Alternatives A3 (for its stations at NE 145th and NE 185th Streets), B1, B2, B2A, and C1.

Five businesses in Lynnwood provided comments. All strongly preferred Alternative C3, or an alternative that is not aligned along 52nd Avenue West, to avoid the business acquisitions that Alternative C1 would have. These businesses stated that relocation would be difficult. One of the businesses employs more than 100 employees.

7.4 Comments from Community Organizations

Sound Transit received comments from community organizations, including established organizations as well as less formal neighborhood groups. Most of these groups wrote in support of the project, but some had concerns about specific alternatives or issues. Table 7-3 lists the community organizations that commented.

Table 7-3. List of Community Organizations Providing Comments

Comments from Community Organizations		
145th-155th Street Station Citizens Committee	Latvian Association of the State of Washington	Seashore Transportation Forum
185th Station Citizen Committee	Latvian Evangelical Lutheran Church Abroad	Seattle Congregation of Estonian Evangelical Lutheran Church
American Latvian Association	Latvian Evangelical Lutheran Congregation of Seattle and Latvian Association of Washington	Seattle Estonian Society
American Latvian Association, Latvian Museum	Latvian Seniors Association	Seattle Latvian Community Center
American Latvian Youth Association	Latvian Sorority Gundega	Seattle Latvian Lutheran Church
Bellevue Sister Cities Association	Lettonia State of Washington Alumni Association	Seattle Latvian School
Cascade Bicycle Club	Mezotne Latvian Language Camp	Senior Services
Edmonton Latvian Society	Northgate West Condominiums	Sigulda
Estonian American National Council	North King County Mobility Coalition	Sound Cities Association
Feet First	Paramount Park Neighborhood Group	Thornton Creek Alliance
Fellowship of American Baltic Spouses	Parkwood Neighborhood Association	Thornton Creek Legal Defense Fund
Friends of Jackson Park Trail	Pilchuck Audubon Society	Transportation Choices
Futurewise	Ridgecrest Neighborhood Association	West Coast Latvian Song Festival
Honorary Consul of the Republic of Estonia		
Lithuanian-American Community—Washington State Chapter	Save Scriber Creek Park	World Federation of Free Latvians

About half of the written comments from organizations, as well as half the statements made at public hearings, were associated with the Seattle Latvian Evangelical Lutheran Church and its community center. These commenters urged Sound Transit to choose an alternative that would not affect the church or community center because it is an important and unique community resource. Twenty-three different organizations affiliated with Latvian heritage sent written comments, including the Honorary Consul of the Republic of Estonia in Seattle. Their comments consistently highlighted the importance of the Latvian Evangelical Lutheran Church and Community Center for the local and national Baltic community. Many of the comments described how these facilities have been used

for cultural activities and events for more than four decades, after being relocated in the 1970s. Some representative comments follow:

> "The center is of important cultural heritage and importance to Seattle-area Latvians and Balts. When the Latvian refugees were admitted to the United States after World War II, several hundred settled in the Seattle area."
>
> "The church and the center are the glue holding our organization (Latvian Sorority Gundega) and our community together, allowing it to grow while preserving Latvian ethnicity and culture."
>
> "I am very concerned that all of the proposed alternatives will severely impact the Latvian Church and Community Center and the activities of hundreds of families who consider it their 'ethnic home.'"

Organizations such as Futurewise, Sound Cities Association, Transportation Choices Coalition, North King County Mobility Coalition, and SeaShore Transportation Forum commented on transit-oriented development, mobility, and access issues. Most of these organizations preferred a station at NE 145th Street and were opposed to the NE 155th Street Station, typically citing access and transit-oriented development potential for their preferences. Most also supported the NE 185th Street Station, and Futurewise and Transportation Choices Coalition supported a station at NE 130th Street. They also supported Alternative B2A, citing its transit-oriented development potential.

Transportation Choices Coalition, Feet First, and the Cascade Bicycle Club emphasized the need for the project to provide multimodal benefits, including benefits to bicyclists and pedestrians, and urged Sound Transit to do more to provide facilities and infrastructure for these travel choices. Some of the suggestions included evaluating potential new bicycle and sidewalk facilities within a 3-mile radius of the proposed light rail stations, adding more stations, constructing more sidewalks and bicycle improvements instead of parking facilities, and siting the stations as far from I-5 as possible. Several parties questioned the need for parking garages when the region is encouraging denser communities that depend less on the automobile.

The North King County Mobility Coalition was concerned with ADA issues. The organization felt the Draft EIS focused primarily on the needs of able-bodied commuters, and it would like to see greater outreach to and input from special needs communities as the project continues.

Several community or neighborhood groups and associations located along the corridor wrote comments about specific alternatives and issues near them. Many of these groups were from neighborhoods in Segment A, and included the Ridgecrest Neighborhood Association, the Paramount Park Neighborhood Group, the Parkwood Neighborhood Association, and neighborhood groups near the NE 185th Street and NE 145th/NE 155th Street stations. Several of these groups discussed

trade-offs between the NE 145th Street and NE 155th Street Stations, but indicated that their members were not unified in a station preference. Others encouraged Sound Transit to develop stations that were in scale with the neighborhood and allowed good access from the neighborhoods. Congestion, parking, visual impacts, noise, and safety were common concerns.

The Save Scriber Creek Park group circulated a petition against Alternatives C1 and C2, and gathered approximately 1,800 signatures (their count). They stated Alternative C3 was the clear "winner" with their group.

The Thornton Creek Legal Defense Fund, Paramount Park Neighborhood group, Thornton Creek Alliance, and Friends of Jackson Park Trail wrote letters concerning impacts to Thornton Creek and other natural resources in the project area, water quality, parks, trails, and open spaces; several of the letters suggested areas where mitigation was needed.

7.5 Comments from Individuals

Sound Transit and FTA received 555 comment submittals from individuals, either in writing or recorded by court reporters at the open houses and public hearings. They covered a wide range of topics; the most common are presented here.

Segment A Alternatives

Of the Segment A alternatives, A1 was most often identified as the preferred route with A5 and A10 having the second greatest preference. Of the alternatives for station locations, more people favored the NE 130th Street Station, followed by preference for the NE 145th Street Station and the NE 155th Street Station. Of the options for the NE 185th Street Station, those who identified an option chose Option 1 (at-grade station east of I-5 with 500-stall parking garage to the west) over the other two options.

Segment B Alternatives

Of the Segment B alternatives, B2A was preferred by the most people. With this alternative, more people supported the 220th Street SW Station than opposed it.

Segment C Alternatives

Of the Segment C alternatives, the majority of responders preferred Alternative C3, with C1 the second most preferred. Those in support of Alternative C3 typically cited the need to preserve Scriber Creek Park, but many also noted acquisition and displacement impacts and stream and wetland impacts. The majority of those in favor of C1 provided their comments via a form letter with no explanation for their preference.

Acquisitions, Displacements, and Relocations

Most of the individual comments were related to acquisitions, displacements, and relocations, primarily regarding the Seattle Latvian Evangelical Lutheran Church. Comments related to other properties were less common, although several provided detailed descriptions of the impacts to specific properties. For instance, the owner of rooming houses south of the proposed NE 130th Street Station was concerned with acquisition of the properties and the effects it would have on investment and income. Similar comments came from businesses affected by Alternative C1 or C2.

Social Impacts, Community Facilities, and Neighborhoods

Comments on social impacts, community facilities, and neighborhoods focused largely on the Segment A alternatives, especially the Seattle Latvian Evangelical Lutheran Church, and on Segment C Alternatives C1 and C2. The largest number of comments were from members of this church and users of the community center. They described the importance of the Seattle Latvian Evangelical Lutheran Church and community center and stated concerns about not only the loss of these facilities, but also the potential effects of the loss of community.

Transportation

Transportation had the third greatest number of comments among environmental impact topics. The most common comments concerned pedestrian and bicycle amenities, parking, transit, and local streets and intersections. The main comments related to parking included on-street parking conflicts between local residents and commuters, insufficient parking, and too much parking (i.e., Sound Transit should not provide parking). Commenters also emphasized the need to integrate local transit with the light rail system and expressed concern over increased traffic in the vicinity of station locations and the potential effects on local streets and arterials.

Land Use and Economics

Most comments on land use and economics were related to transit-oriented development, including comments favoring specific stations that they felt could create transit-oriented development opportunities. Other commenters noted concerns about property values for single-family homeowners, or the need for mitigation during construction.

Visual and Aesthetic Resources

There were some concerns about impacts on visual and aesthetic resources. Most of these comments were from those living in single-family homes abutting the proposed alignments.

Noise and Vibration

Noise and vibration-related comments were mostly about the potential for noise, and included comments from single-family homeowners and representatives of the Seattle Latvian Evangelical Lutheran Church.

Ecosystem Resources

Most of the comments on ecosystem resources related to tree and vegetation removal, and impacts to streams and wetlands. Most expressed concerns about the impacts of Alternatives C1 and C2 on the ecosystem resources at Scriber Creek Park and associated wetlands.

Public Services, Safety, and Security

The few comments received on this topic were mostly about impacts to the fire station near the proposed NE 155th Street Station.

Cultural, Archaeological, and Historic Resources

There were few comments on this specific topic, although there were many comments noting the Seattle Latvian Evangelical Lutheran Church as an important cultural center for Latvians and those with Baltic heritage.

Parks and Recreational Resources

This topic received numerous comments. Most were related to the parks and open space in the vicinity of Alternatives C1 and C2, especially Scriber Creek Park.

Suggestions for Other Alternatives

Sound Transit received some comments recommending other alternatives or modifications to the alternatives presented in the Draft EIS. Chapter 2 describes how these suggestions were addressed in the Final EIS. The primary suggestions were:

- The City of Lynnwood suggested a modified Alternative C3 that would potentially allow greater redevelopment of the City Center property block east of 44th Avenue West; the modification would place a station and alignment generally midway between Alternatives C2 and C3. (The Edmonds School District supported this suggestion as well.)
- The Pilchuck Audubon Society asked Sound Transit to consider an alternative that would avoid the Scriber Creek area. It proposed extending the route farther along I-5 before shifting east to the Lynnwood Transit Center or continuing the route north to the Alderwood Mall.
- Futurewise asked Sound Transit to consider a new alternative in Segment C to allow for a station closer to the Lynnwood Transit Center.

Most other commenters did not suggest new alternatives, but many encouraged considering options to avoid affecting the Seattle Latvian Evangelical Lutheran Church, including a comment suggesting moving I-5 to the west. Others recommended options that would avoid properties in specific locations. Another suggested a station at 220th Street SW in the freeway median.

7.6 Responses to Common Comments

Appendix P of this Final EIS includes responses to each substantive comment received during the Draft EIS public comment period. It lists the commenter's name and comments, and provides Sound Transit's and FTA's responses. Table 7-4 shows some of the most common comments received and the responses. They have been summarized or paraphrased.

Table 7-4. General Responses to Draft EIS Common Comments

Common Theme	Common Response
Alternatives Considered	
Consider a modified Alternative C3.	In response to the City of Lynnwood's request for a modified Alternative C3 to better connect to the Lynnwood Transit Center, preserve re-developable land, and minimize wetland and stream impacts, Sound Transit, in collaboration with the City of Lynnwood, developed a modification of Alternative C3 for the Final EIS. The Final EIS calls this the Preferred Alternative.
Consider increasing the number of stations.	Sound Transit considered additional stations beyond those outlined in earlier planning studies and additional stations were added as a result of early EIS scoping comments. Opportunities for stations also need to coincide with east-west access points, which are limited. As a regional transit project with a purpose and need to connect major regional centers, the number of stations needs to be balanced with the prevailing surrounding densities (single-family residential in much of this corridor) and the increase in system-wide travel time that would result from adding stations.
Did Sound Transit consider routes away from I-5?	Alternative routes away from the I-5 corridor were considered during the Alternatives Analysis and early EIS planning based on input from the public during early scoping and EIS scoping. These routes included alignments along Lake City Way, 15th Avenue NE, and SR 99. Given the lack of available right-of-way in the largely developed areas outside of I-5, these other alignments would involve higher levels of impacts to traffic and the built environment (particularly neighborhoods), lower ridership, and higher costs. For more detail see Section 2.6 in Chapter 2.

Table 7-4. General Responses to Draft EIS Common Comments

Common Theme	Common Response
Transportation Impacts and Mitigation	
Multimodal access to the stations should be a high priority. Sound Transit should accommodate all modes, including buses, bicycles, pedestrians, and automobiles.	The project's purpose is to expand the light rail system in order to provide reliable, rapid, and efficient transit service that, among other benefits, connects to the regional multimodal transportation system. This system includes buses, bicycles, pedestrians, automobiles, paratransit, and persons with disabilities. Appendix F, Conceptual Plans, of the Final EIS illustrates the conceptual design of station features that accommodate these modes. Sound Transit has also adopted a system access policy to help guide access decisions throughout the region.
Suggestions to lower or increase the parking provided at stations.	The alternatives identify the number of park-and-ride spaces for station options as a planning estimate that serves as a conservative basis for impact analysis, cost estimating, and ridership forecasts. For the Final EIS, additional parking supply options were also considered at Mountlake Terrace Transit Center and the Lynnwood Transit Center. The estimates consider accessibility of the station area, overall ridership, conditions of the local roadway network, the desires of the local jurisdictions and surrounding community, and the likely demand for automobile access to the stations. The automobile demand is also analyzed from an overall corridor perspective and the distribution of spaces by station. Sound Transit balances the sizing and design of the parking facility at the station with the need for good multimodal connections in order to serve the needs of the region as well as local communities. The agency's system access policy will also guide final design details about parking spaces.
What are the proposed traffic mitigation and improvements in the neighborhoods surrounding the proposed stations?	The traffic impact mitigation measures are identified in the Final EIS in Chapter 3. Sound Transit updated them to reflect design refinements as well as additional traffic forecasts and analysis. In addition to mitigation, some elements of the project (such as new or modified roadways, sidewalks, and intersections) are described in Chapter 2, with conceptual designs illustrated in Appendix F.
Environmental Impacts and Mitigation	
4.1 Acquisitions, Displacements and Relocations; 4.4 Social Impacts, Community Facilities, and Neighborhoods	
Avoid displacement of the Seattle Latvian Evangelical Lutheran Church. The church is culturally important to the region's Latvian community, the larger Baltic community, and those interested in Scandinavian studies.	All Segment A alternatives now realign a section of 3rd Avenue NE to avoid displacing the church or the church hall (also called the cultural center).

Table 7-4. General Responses to Draft EIS Common Comments

Common Theme	Common Response
4.2 Land Use	
Consider transit-oriented development at station locations.	Sound Transit's policy is to support transit-oriented development around its light rail stations. However, conceptual plans for the stations (including parking garages) do not depict specific transit-oriented development details. Several stations are also on the I-5 right-of-way, where non-transportation uses are not allowed, although development could still occur on nearby properties. Sound Transit will consider opportunities to encourage transit-oriented development partnerships with others. Sound Transit will also coordinate with local jurisdictions and other property owners to consider opportunities to maximize transit-oriented development potential in station areas.
4.5 Visual and Aesthetic Resources	
Retain mature trees to improve aesthetics and to provide a visual separation for the residential areas surrounding the stations.	The Preferred Alternative has modifications to minimize tree removal in some locations, but in other locations removal is unavoidable. The project will include landscaping and aesthetic treatments where feasible, and WSDOT and the Cities also have tree replacement requirements that apply to the project. It may take 15 to 20 years for plant growth to fully screen large facilities, such as parking garages or the guideway, and replacing the mature evergreen trees could require 30 to 50 years of growth. Section 4.5.6 in Chapter 4 has more details.
4.7 Noise and Vibration	
Retain a tree buffer to minimize noise created by the light rail.	Dense, evergreen foliage, at least 100 feet deep and 20 feet high, has been shown to reduce noise from traffic by up to 3 dB; however, the project corridor is too narrow to maintain enough foliage to notably reduce noise levels. Buffers may still be used to help minimize visual impacts. Section 4.7 (Noise and Vibration) describes the mitigation measures Sound Transit would take to address noise impacts.
Noise pollution from I-5 is already an issue; please minimize additional noise that would result from the proposed light rail.	It is Sound Transit's policy to mitigate moderate to severe noise and vibration impacts caused by the project, as defined by FTA and FHWA criteria.
4.8 Ecosystem Resources	
Sound Transit's alternatives should protect wetlands and streams.	The alternatives were developed to protect or avoid impacts to wetlands and streams, especially high quality resources. In areas where impacts may still occur, Sound Transit has explored design refinements that could avoid or reduce impacts. In addition to complying with local, state, and federal environmental laws and regulations that emphasize avoidance and minimization, Sound Transit's policy, Executive Order No. 1, Establishing a Sustainability Initiative for Sound Transit (2007), states that Sound Transit's projects are to avoid impacts on environmentally sensitive resources to the maximum extent practicable and to provide adequate mitigation to ensure no net loss of ecosystem function and acreage as a result of agency projects. These values have been incorporated in the design of the alternatives for this project.

Table 7-4. General Responses to Draft EIS Common Comments

Common Theme	Common Response
4.9 Water Resources	
Incorporate low impact development into all alternatives to the maximum extent feasible.	Sound Transit requires all projects to consider low impact development methods, such as permeable pavement, as a first choice for stormwater treatment. Many such measures are already incorporated within the project's conceptual designs, and Sound Transit will continue to consider low impact development strategies as part of the final design.
4.14 Public Services, Safety and Security	
Avoid interference with Shoreline Fire Station No. 65 near proposed NE 155th Street Station.	Sections 4.14.2 and 4.14.5 in Chapter 4 describes measures Sound Transit could apply to manage traffic serving the station while maintaining effective access for the fire station. If this station is included in the project, Sound Transit would work closely with the City of Shoreline and the Fire Department to resolve potential conflicts with bus and vehicle traffic, and to maintain emergency response times and access during the construction period and light rail operation.
4.17 Parks and Recreational Resources	
Please avoid impacting Scriber Creek Park.	Alternatives C1 and C2 impact Scriber Creek Park. Alternative C1 crosses Scriber Creek Park, while Alternative C2 runs near (but outside) the southern border of the park. Section 4.17.6 in Chapter 4 includes proposed measures to mitigate impacts if these alternatives are selected; however, for Alternative C1, some impacts would be unavoidable. For this reason, FTA has determined that Alternative C1 would result in a Section 4(f) use of Scriber Creek Park; therefore, Sound Transit would need to pursue alternatives that would avoid the park. The Preferred Alternative and Alternative C3 would not impact Scriber Creek Park.

Appendix B

Glossary

APPENDIX B – GLOSSARY

Access Time. The time required to walk, bicycle, or drive from the origin of the trip (for example, from home) to a (boarding) transit stop, plus the waiting time based on the frequency of transit service, and/or the transfer time and the walking or driving time from the transit (de-boarding) stop to the destination. For automobile trips, it is the time required to walk to and from parking places, and delays within parking facilities, if any.

Accessibility. The ease by which an individual can reach desired activities in any location by use of the transportation system.

Air Pollutant. Smoke, dust, fumes, or odors in the ambient air that have the potential for harmful effects.

Alighting. Term describing the departure of passengers from a bus or transit vehicle.

Alignment. Horizontal geometric elements, which define the location of the light rail track or roadway.

Alluvium. An unconsolidated, terrestrial sediment composed of sorted or unsorted sand, gravel, and clay that have been deposited by water in streams, rivers, and creeks.

Annualized Capital Cost. A one-time capital cost converted into an annual value that incorporates both the depreciation on the capital item and the foregone interest on the money invested in the project.

Aquatic Resource. The physical elements of the aquatic environment, such as streams, rivers, lakes, and shorelands; as well as life forms such as aquatic plants and fish that live within the aquatic environment.

Aquifer. An underground layer of water-bearing permeable rock or unconsolidated materials (gravel, sand, or silt) from which groundwater can be extracted using a water well.

Area Source. A general classification of the origin of an air pollutant (e.g., park-and-ride lots are area sources of carbon monoxide emissions).

Arterial. A major thoroughfare used mainly for through traffic rather than access to adjacent property. Arterials generally have greater traffic-carrying capacity than collector or local streets and are designed for continuously moving traffic.

Artifact. Any portable object used and/or modified by civilization (particularly during prehistoric times).

At-Grade. Term used to express that a feature, such as a rail track or crosswalk, and a roadway meet at the same elevation.

At-Grade Crossing. Any intersection of two or more flows of traffic at the same elevation (possibly involving more than one mode of transportation), such as light rail/road crossings.

Attainment Area. An attainment area is an area considered to have air quality as good as or better than the national ambient air quality standards for specific pollutants as defined in the Clean Air Act.

Average Annual Megawatt. The average hourly demand for or supply of electricity measured in megawatts over a year.

Average Daily Traffic (ADT). The total volume of traffic during a given time period divided by the number of days in that time period, representative of average traffic in a 1-day time period.

Average Time (also, Exposure Time). The duration of exposure to a given concentration of an air contaminant, specified in the ambient air quality standards (e.g., the two national standards of 9 parts per million and 35 parts per million specify averaging times of 8 hours and 1 hour).

Average Wait Time. Average time spent by passengers at a station or bus stop waiting for transit service.

Average Weekday. A measurement of average conditions during one weekday, i.e., Monday through Friday.

A-Weighted Sound Level (dBA). To approximate the way humans interpret sound, a filter circuit with frequency characteristics similar to the human hearing system is built into sound measurement equipment. Measurements with this filter enacted are referred to as A-weighted sound levels, expressed in dBA (see Decibel).

Background Concentration. The pollutant level that would exist at a site in the absence of air pollution sources in the neighborhood of the site.

Baseline Energy Consumption. Energy consumption, usually for a no-build alternative, that is used as a reference against which energy consumption for a build alternative is compared.

Best Management Practices (BMPs). Approved physical, structural, and/or managerial practices that, when used singularly or in combination, prevent or reduce pollutant discharges.

Bioretention Facility. A shallow landscaped depression with an engineered soil mix designed to filter runoff from a small contributing area, which can be in the form of a swale or cell. It is commonly referred to as a rain garden.

Boarding. Term describing the arrival of passengers onto a bus or transit vehicle.

Boarding Trips. A trip on a transit line or group of lines where each boarding of a transit vehicle is considered the start of a new trip. Number of trips boarding (entering) transit vehicles, regardless of whether the trip involves a transfer from another transit vehicle. A fare may or may not be collected for each boarding trip, depending on whether a transfer is used.

British Thermal Unit (Btu). An energy unit equal to the quantity of heat required to raise the temperature of 1 pound of water 1 degree Fahrenheit.

Buffer. An area adjacent a critical area (e.g., wetland or stream) that functions to avoid loss or decline in ecological functions and values. In addition to preserving the ecological functions of a

wetland system, a buffer physically isolates a critical area from potential disturbance and harmful intrusion, and works to minimize risk to the public from loss of life, well-being, or property damage.

Capacity, Person. The maximum number of persons that can be carried past a given location during a given time period under specified operating conditions without unreasonable delay, hazard, or restriction (usually measured in terms of persons per hour).

Capacity, Roadway. The maximum hourly rate at which persons or vehicles can reasonably be expected to traverse a point or uniform section of a lane or roadway during a given time period under prevailing roadway and traffic conditions.

Capacity, Vehicle. The maximum number of vehicles that can be accommodated in a given time by a transit or highway facility.

Capital Costs. Non-recurring costs required to construct transit systems, including costs of right-of-way, facilities, rolling stock, power distribution, and the associated administrative and design costs, as well as financing charges during construction.

Carbon Monoxide (CO). A colorless, odorless, tasteless gas, and one of the U.S. Environmental Protection Agency's criteria air pollutants released from automobile exhaust.

Carpool. A group of passengers and drivers organized to use one automobile on a regular basis, riding together, for the same trip purpose (generally the work trip).

Census Tract. A census tract is a small subdivision of an urban area used by the U.S. Census Bureau to identify population and housing statistics. Census blocks are subdivisions of census tracts and are the smallest unit of census geography for which the Census Bureau collects data. The boundaries of census blocks are generally streets or other notable physical features and often correspond to a city block. A census block group is a combination of census blocks, typically encompassing two to four city blocks. The U.S. Census collects some information at the block level, some at the block group level, and some at the tract level.

Channelization. The use of traffic markings or islands to direct traffic into certain paths. For example, a "channelized" intersection directs portions of traffic into a left turn lane through the use of roadway islands or striping that separates the turn lane from traffic going straight.

Circulation. The free movement or passage of a vehicle, pedestrian, bicycle, or other transportation mode through a given area.

Concentration (also, level). A measure of the air pollutant in the ambient air, having the units of mass per volume.

Conformity (air quality). A process that ensures federal funding and approval goes to transportation activities consistent with federal air quality goals. The Federal Highway Administration and the Federal Transit Administration jointly determine that specific regions meet air quality standards.

Construction Staging Area. During construction, a site temporarily used for materials or equipment storage, assembly, or other temporary, construction-related activities.

Corridor. A general path from one point to another; the Lynnwood Link Extension study corridor begins in Northgate and travels north to Shoreline, Mountlake Terrace, and Lynnwood.

Criteria Air Pollutants. Those air pollutants that have been recognized by the U.S. Environmental Protection Agency as potentially harmful and for which standards have been set to protect the public health and welfare. The criteria air pollutants are carbon monoxide, sulfur dioxide, particulates, nitrogen dioxide, ozone, hydrocarbons, and lead.

Day Night Sound Level (Ldn). Ldn is a 24-hour equivalent continuous sound level (Leq), but with a 10-dB penalty assessed to noise events occurring at night. Nighttime is defined as 10 pm to 7 am. This strongly weights Ldn toward nighttime noise because most people are more easily annoyed by noise during the nighttime hours when background noise is lower and most people are sleeping.

dBA. The sound level obtained through the use of A-weighting characteristics specified by the American National Standards Institute (ANSI) Standard S1.4-1971. The unit of measure is the decibel (dB), commonly referred to as dBA when A-weighting is used. The "A" weighting scale closely resemble human response to noise.

Decibel. The unit used to measure the loudness of noise.

De Minimis Finding. De minimis is a Latin phrase meaning something of insignificance or negligible. De minimis impacts are defined as those elements that do not adversely affect the activities, features, and attributes of a Section 4(f) resource or property.

Dewatering. The temporary removal of ground or surface water from a construction area to allow construction to be done under dry conditions.

Displacement. A property acquisition that would require removing an existing use.

Disturbed Habitat. A habitat in which naturally occurring ecological processes and species interactions have been significantly disrupted by the direct or indirect results of human presence and activity.

Drop-Off Zone. A station that provides temporary loading and unloading facilities for automobiles and/or buses. The station may be combined with feeder bus stations, stations that provide lateral bus transportation service for riders to transfer to a light rail mode.

Ecologically Sensitive Area. An area, valued locally for its rare or sensitive habitat, existing in a relatively undisturbed, natural state and supporting indigenous species.

Elevated Guideway. A guideway that is positioned above the normal activity level (e.g., elevated structure for light rail to cross over a street).

Emission. Particulate, gaseous, noise, or electromagnetic byproducts of the transit system or vehicle.

Emission Control. Method by which emissions are governed in an effort to minimize pollutants and/or noise.

Emission Inventory. A listing by emission source of the amounts of air pollutants released into the atmosphere (generally, in tons or kilograms per day).

Emission Source. The origin of an air pollutant (e.g., automobiles and trucks are sources of carbon monoxide, hydrocarbons, and nitrogen oxides).

Emission Standards. A limitation on the release of an air contaminant into the ambient air (e.g., the federal government limits carbon monoxide, hydrocarbon, and oxides of nitrogen (NOx) emissions per mile of travel in new automobiles).

Endangered Species. According to the Endangered Species Act of 1973, an endangered species is any species in danger of extinction throughout all or a significant portion of its range, other than an insect determined by the Secretary of the Interior to constitute a pest whose protection under the provisions of this act would present an overwhelming and overriding risk to man.

Equivalent Level (Leq). Leq is a measure of sound energy over a period of time. It is referred to as the equivalent sound level because it is equivalent to the level of a steady sound which, over a referenced duration and location, has the same A-weighted sound (dBa) energy as the fluctuating sound.

Express Service. Transit service where a very limited number of stops is made.

Facility. The means by which a transportation mode is provided. For example, a sidewalk is a facility for pedestrians as a highway is a facility for vehicles.

Fixed Guideway. A public transportation facility using a separate right-of-way for the exclusive use of public transportation or a system of vehicles that can operate on its own guideway constructed for that purpose (e.g., commuter rail, light rail).

Forest or Woodland Habitat. In the Puget Sound lowlands, a habitat type generally dominated by Douglas fir, western red cedar, and western hemlock, frequently with a hardwood understory. The ground cover is generally lush. Birds and small mammals abound, and larger mammals are common in large stands.

Frequency, Vehicle. Time rate of vehicle arrivals at a station stop or along a transit line.

Full Acquisition. The full parcel would be acquired and the current use would be displaced. Full acquisitions include parcels that might not be fully needed for the project but would be affected to the extent that current uses would be substantially impaired (e.g., loss of parking or access).

General Purpose Lane. Term used to describe a traffic lane on a highway that can be used by all types of vehicles including single-occupant automobiles, carpools, trucks, and motorcycles.

Glacial Till. This type of soil typically consists of a diverse mix of gravelly sand with scattered cobbles and boulders in a clay/silt matrix. It is very dense and is locally referred to as "hardpan." The predominant glacial till encountered in the project area is Vashon-age glacial till.

Grade Separated. Parallel or crossing lines of traffic that are vertically or horizontally physically separated from each other and do not share a common intersection.

Greenhouse Gases (GHG). Greenhouse gases include carbon dioxide (CO_2), methane (CH_4), ozone (O_3), water vapor, nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF6). These gas emissions are collectively leading to the greenhouse effect, trapping the sun's solar rays and leading to an increase in Earth temperature.

Groundborne Noise. Noise that is transmitted through the ground, typically reported in decibels.

Groundborne Vibration. A small but rapidly fluctuating motion transmitted through the ground, typically reported as velocity or acceleration.

Guideway. Specifically designed way traversed by transit vehicles constrained to the way (see Elevated Guideway).

Habitat Function. Terrestrial plant communities, wetlands, and aquatic systems such as streams provide a variety of functions in the environment. For instance, depending on the condition and location of a wetland, wetland functions might include water quality improvement, groundwater recharge, nutrient and sediment filtering, and habitat for a variety of animals, as well as education and recreation opportunities for people—the habitat function is one of several functions potentially performed by wetlands. Similarly, terrestrial and aquatic systems each also may perform many functions. When they provide habitat for animals, they are said to be performing or providing a "habitat function."

Habitat Value. The value of a plant community's function as determined by the habitat's ability to support the needs of biological species. High-value habitats are those that support or may support threatened, endangered, and/or sensitive species as determined by federal, state, and local jurisdictions.

Hazardous Materials. Hazardous materials are materials, which, because of their chemical, physical, or biological nature, pose a potential risk to life, health, or property when released. Such materials include hazardous waste, dangerous waste, hazardous substances, and toxic substances.

Headway. The headway between vehicles in public transit systems is the amount of time (usually in minutes) that elapses between two vehicles passing the same point traveling in the same direction on a given route.

High-Capacity Transit. A system of public transportation services within an urbanized region operating principally on exclusive rights-of-way; examples include light rail transit or express buses on exclusive bus ways and their supporting services.

High-Occupancy Vehicle (HOV). Any passenger vehicle that meets or exceeds a certain predetermined minimum number of passengers, for example, more than two or three people per automobile. Typically includes carpools with two or more people, vanpools, and buses.

Hours of Service. The number of hours during the day between the start and end of service on a transit route, also known as the service span.

Indirect Energy. A term used to denote all energy inputs for the construction, operation, and maintenance of a system.

Indirect Source. An entity that does not directly emit pollutants but attracts emission sources such as automobiles and trucks. Shopping centers, stadiums, and highways are examples of indirect sources.

Integration with Other Modes. Method by which a transit system interfaces with other modes of transportation.

Interchange. The system of interconnecting ramps between two or more intersecting roadways or guideways that are grade separated.

Interim Terminus. A station where the project would operate until the next portion of the project can be built. The terminus would typically include a station with tail tracks extending beyond the station for layover of trains.

Kilowatt (kW). A unit of electrical energy.

Kilowatt-hour (kWh). One kilowatt of energy used over one hour.

Land Development Pattern. The use, types, and intensity of development. Land development patterns affect trip demand, average trip length, and, therefore, energy consumption.

Landscaped Habitat. A habitat in urban areas having limited native species. Vegetation generally consists of mowed lawns and exotic trees and bushes.

Ldn. The day/night average noise level.

Leq. The equivalent steady-state sound level that, in a specified time period, would contain the same acoustic energy as the varying sound level during the same period; considers volume capacity, travel speeds, and delay.

Leq(h). The hourly value of Leq.

Level of Service (LOS). A qualitative measure that represents the collective factors of travel under a particular volume condition. A measure of traffic congestion.

Light Rail Transit (also Light Rail). A mode of mass transportation comprising light rail vehicles, which travel on steel tracks and are powered by electricity from overhead wires. This mode is characterized by its ability to operate in at-grade and/or grade-separated environments.

Link. Sound Transit's light rail system.

Liquefaction. Conversion of soil into a fluid-like mass during an earthquake or other seismic event.

Load Factor. The average ratio of passengers to seats, during a specified period of operation of a public transit route.

Local Service. A type of transit operation involving frequent stops and consequent low speeds, the purpose of which is to deliver and pick up transit passengers as close to their destinations or origins as possible.

Locally Preferred Alternative. Following the publication of the Draft EIS, the Sound Transit Board identifies a preferred alternative consisting of routes and station preferences. This is known as

a "locally" preferred alternative because the Federal Transit Administration has not yet selected a preferred alternative.

Low Income. A person whose median household income is at or below the U.S. Department of Health and Human Services poverty guidelines.

Low Income Population. Any readily identifiable group of low-income persons who live in geographic proximity, and, if circumstances warrant, geographically dispersed/transient persons (such as migrant workers or Native Americans) who will be similarly affected by the project.

Maintenance Area. Maintenance areas are geographic areas with a history of non-attainment of National Ambient Air Quality Standards (NAAQS) but which now consistently meet NAAQS.

Median Alignment. In rail operations, a type of alignment where tracks are positioned in the median on the street, as opposed to being positioned on one side of the street.

Megawatt (MW). 1,000,000 watts.

Microgram per Cubic Meter ($\mu g/m^3$). A unit of concentration equal to one thousandth of a gram per cubic meter.

Minimum Turn Radius. Generally assumed to be the minimum horizontal turn radius (tightest curve).

Minority. A person who is:

- Black - A person having origins in any of the black racial groups of Africa;
- Hispanic or Latino - A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race;
- Asian - A person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent;
- American Indian or Alaskan Native - A person having origins in any of the original people of North or South America, including Central America, and who maintains cultural identification through tribal affiliation or community recognition; or
- Native Hawaiian or Other Pacific Islander - A person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands.

Minority Population. Any readily identifiable groups of minority persons who live in geographic proximity, and if circumstances warrant, geographically dispersed/transient persons (such as migrant workers or Native Americans) who will be similarly affected by the project.

Mobility. The ease of continuous movement along the transportation system.

Mode. A particular form or method of travel, such as pedestrian, bicycle, automobile, bus, or light rail.

Mode Share. The percentage of travelers that travel either by single-occupancy vehicle, high-occupancy vehicle, or transit modes on a given roadway facility.

Mode Split. Forecast of proportion of total person trips that would use each of the various modes of transportation that include transit and cars.

Model Toxics Control Act (MTCA). The Model Toxics Control Act Cleanup Regulation, WAC 173-340, implements the Model Toxics Control Act, RCW 70.105D, which addresses strict requirements for site discovery and reporting, site assessments, and site remediation. Most important, the regulation defines standard methods used to assess whether a site is contaminated or clean.

National Ambient Air Quality Standards (NAAQS). Federal limits on levels of atmospheric contamination necessary to protect the public from adverse effects on health (primary standards) and welfare (secondary standards).

National Historic Preservation Act of 1966 (NHRA). The Act that established the National Register of Historic Places and State Historic Preservation program and set forth guidelines and regulations for environmental review of projects involving federal funding.

National Register of Historic Places (NRHP). The official list of the nation's cultural resources determined to be worthy of preservation; the register is maintained by the National Park Service.

Network. A system of real or hypothetical interconnecting links that forms the configuration of transit routes and stops comprising the total system.

New Starts. A federal funding program administered by the Federal Transit Administration. Section 5309 New Starts funds are discretionary federal funds available for new fixed guideway systems and extensions to existing systems.

Noise Wall. A noise barrier (also called a sound wall) that is an exterior structure designed to protect inhabitants of sensitive land use areas from noise pollution. Noise walls are considered the most effective method of mitigating roadway, railway, and industrial noise sources.

Nonattainment Area. An area designated by the U.S. Environmental Protection Agency as currently violating the National Ambient Air Quality Standards, based on archival air quality data.

NO_x. Oxides of nitrogen (nitrogen oxide and nitrogen dioxide). The pollutants released during high-temperature combustion of fossil fuels such as diesel.

Off-Peak. Those periods of the day when demand for transit service is not at a maximum.

Operating Costs. Recurring costs incurred in operating transit systems, including wages and salaries, maintenance of facilities and equipment, fuel, supplies, employee benefits, insurance, taxes, and other administrative costs. Amortization of facilities and equipment is not included.

Operating Revenue. The gross income from operation of the transit system including fares, charter income, concessions, advertising, etc. Does not include interest from securities, non-recurring income from sale of capital assets, etc.

Operational Energy. The energy used for vehicle propulsion, facilities, and maintenance for a specified period, usually one year.

Originating Ride (or Trip). A one-way trip taken on a transit line or group of lines, where a transfer from one line to another is not considered to be the start of a new trip.

Overhead Catenary. The system of electrical transmission wires suspended over the track to supply power for the light rail vehicles.

Ozone. A gas consisting of three oxygen atoms formed in reactions of non-methane hydrocarbons and nitrogen oxides in the presence of sunlight. Ozone is one of the U.S. Environmental Protection Agency's criteria air pollutants.

Palustrine Wetland. Freshwater wetlands dominated by trees, shrubs, and emergent vegetation.

Park-and-Ride Lot. A lot that provides parking for patrons of a transit facility.

Parking Utilization. The number of parking spaces being utilized at a given location; it is calculated as the total number of parking spaces occupied divided by the total parking supply at a given location.

Partial Acquisition. Part of a parcel would be acquired, but the current use generally would not be displaced. In some instances, such as larger parcels that hold multiple uses, a business or residential unit on a parcel could be displaced, but most uses would remain.

Particulate Matter. A mixture of extremely small particles and liquid droplets that is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. U.S. Environmental Protection Agency is concerned about particles that are 10 micrometers in diameter or smaller because those are the particles that generally pass through the throat and nose and enter the lungs.

Passenger Load/Passenger Load LOS. The number of passengers on a transit unit (vehicle or train) at a specified point.

Patronage. The number of person-trips carried by a transit system over a specified time period.

Peak Hour. The hour of the day in which the maximum demand for service is experienced, accommodating the largest number of automobile or transit patrons.

Peak Particle Velocity (PPV). Specifications for allowable levels of vibration from blasting, pile driving, and other construction processes with the potential of causing building damage are almost always expressed in terms of peak particle velocity because this is thought to be well correlated with maximum stresses in buildings. Peak particle velocity is the instantaneous positive or negative peak in the vibration signal.

Peak Period. A time period or periods when travel activity is at its heaviest.

Pedestrian Level of Service (LOS). An overall measure of walking conditions on a route, path, or facility.

Person Demand. The number of persons that use a specific roadway or highway facility, thus creating a demand for usage of the facility; it is often compared to roadway capacity to determine the level of congestion.

Person Throughput. The amount of persons that can pass a point on a roadway or pass through an intersection over a specified period of time.

Person Trip. A trip from a point of origin to a destination made by a person by any travel mode. Within transit, transfers are not counted. That is, a person traveling from home to work on a bus with one transfer creates only one-person trip.

Point Source. A general classification of the origin of an air or water pollutant, usually characterized as smokestacks or outfalls.

Pollution-Generating Impervious Surface (PGIS). Impervious surfaces considered to be a significant source of pollutants in stormwater runoff. Such surfaces include those subject to vehicular use, industrial activities (as defined in Washington State Department of Ecology's Stormwater Management Manual), or storage of erodible or leachable materials, wastes, or chemicals, and which receive direct rainfall or the run-on or blow-in of rainfall.

Polychlorinated Biphenyls (PCBs). Hazardous environmental pollutants upon which the federal government has placed additional controls regulating disposal.

Potentially Affected Area. This is defined differently by each technical discipline. It includes the area that could be affected by the light rail alternatives.

Poverty-Level Household. As used for the 2000 U.S. Census data, the average poverty threshold for a family of four persons was $17,603 in 2000. The defined family poverty level threshold varied by total number of family members, number of children under 18 years, and number of persons over age 65. For a detailed discussion of the poverty definition, see U.S. Bureau of the Census, *Current Population Reports, Series P-60, No. 171, Poverty in the United States: 1988 and 1989.*

Preferred Alternative. Following publication of the Draft EIS, the Sound Transit Board identifies a Preferred Alternative, including route and station options. The Final EIS will further evaluate the Preferred Alternative as well as other alternatives.

Queue. A line of vehicles, bicycles, or persons waiting to be served by the system in which the flow rate from the front of the queue determines the average speed within the queue. Slowly moving vehicles or people joining the rear of the queue are usually considered part of the queue. The internal queue dynamics can involve starts and stops.

Recessional outwash. Sediment deposited by meltwater streams flowing away from a retreating glacier during the last episode of glaciation.

Reliability. How often transit service is provided as promised; affects waiting time, consistency of passenger arrivals from day to day, total trip time, and loading levels.

Right-of-Way. The corridor (horizontal and vertical space) owned by the transit agency for the transportation way.

Riparian Habitat. A habitat type associated with stream or river margins and characterized by dense vegetation consisting primarily of willow, alder, and cottonwood species, supporting a wide variety of waterfowl, songbirds, amphibians, and small mammals.

Route. The course followed by a transit vehicle as a part of the transit system.

Runoff. The rainwater that directly leaves an area in surface drainage, as opposed to the amount that seeps out as groundwater.

Screenline. A screenline is an imaginary line across a section of freeways or arterials. Screenlines are often used in traffic analyses to determine how much volume is entering or exiting a particular area.

Section 106. Section 106 of the National Historic Preservation Act of 1966 established a procedure to review the potential effects on cultural resources by projects that involve a federal action.

Section 4(f). Section 4(f) of the U.S. Department of Transportation Act restricts the United States Department of Transportation's approval of projects affecting the following properties: publicly owned land from a public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site.

Section 401. Section 401 of the Clean Water Act is a certification program administered by the Washington Department of Ecology under guidelines of the U.S. Environmental Protection Agency to ensure projects applying for a Section 404 permit comply with state water quality standards and other requirements of the state law.

Section 404. Section 404 of the Clean Water Act is a permit program administered by the U.S. Army Corps of Engineers under guidelines by the U.S. Environmental Protection Agency to protect the nation's waters from dredged and fill sources.

Section 6(f). Section 6(f) of the Land and Water Conservation Act of 1965 established restrictions on, and replacement requirements for, the use of land acquired with funds authorized under the Land and Water Conservation Fund Act.

Segment. Refers to the three geographic sections of the Lynnwood Link Extension (A, B, and C) in which the proposed alternatives reside, as defined in Chapter 2 of the EIS.

Sensitive Receptor (Auditory). A local area or site that supports activities easily disrupted by audio intrusions or distractions, such as a school, historic landmark, or residential neighborhood.

Sensitive View. A view that is identified by local jurisdictions as requiring protection.

Sensitivity Analysis. A "what-if" type of analysis to determine the sensitivity of the outcomes to changes in parameters; if a small change in a parameter results in relatively large changes in the outcomes, the outcomes are said to be sensitive to that parameter.

Service Frequency. The number of transit units (vehicles or trains) on a given route or line, moving in the same direction, that pass a given point within a specified interval of time, usually 1 hour.

Side-Track Alignment. In rail operations, a type of alignment where the tracks are positioned on one side of the street, as opposed to being positioned in the median of the street.

Signal Phasing. A group of three traffic-signal timed intervals (green, yellow, red) that are assigned to an independent traffic movement or combination of movements.

Social Interaction. Intra-neighborhood communication and circulation using street, sidewalk, and bikeway connections between residential areas and community facilities, retail businesses, and employment centers. Also includes verbal interaction and telecommunications facilities.

Sounder. Sound Transit's commuter rail system, which travels from Everett to Lakewood, through Seattle.

Sound Transit 2 (ST2). A package of high-capacity transit investments in the regional transit system, adopted by the Sound Transit Board in July 2008, which included light rail as the mode choice for the project corridor. ST2 includes a major expansion of the Link light rail system. ST2 would extend light rail from North Seattle into Snohomish County, across Lake Washington into East King County, and south of Sea-Tac International Airport to Federal Way.

Staging Area. Section of land near a construction site designated for equipment and truck storage, maintenance, and warm-up prior to engagement in construction activities.

State Implementation Plan (SIP). A plan required of each state by the Clean Air Act that describes how the state will attain and maintain the National Ambient Air Quality Standards.

Stormwater. Stormwater is rain and snow melt that runs off surfaces such as rooftops, paved streets, highways, and parking lots. As water runs off these surfaces, it can pick up pollution.

Stormwater Detention. The temporary storage of stormwater runoff and subsequent release at a slower rate.

Stormwater Treatment. Stormwater ponds and underground vaults are used to remove sediments and dissolved metals from stormwater. They collect sediments on the bottom of the pond or vault, where maintenance workers can clean them out on a regular basis.

Subarea. A unique portion of the Regional Transit Authority taxing district, one of five as defined in *Sound Move* (Snohomish County, North King County, East King County, South King County, and Pierce County).

Subduction Zone. An area where one crustal plate is descending below another. The Puget Sound area is close to a subduction zone, which is formed by the Juan de Fuca plate descending below the North American plate. This action can cause significant seismic activity.

Terminal. The terminating point of transportation routes with transfer facilities and, often, amenities for passenger convenience.

Terminus. A transit station located at the end of a transit (including light rail) line.

Threatened Species. According to the Endangered Species Act of 1973, any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

Title 23, Code of Federal Regulations, Part 771 (23 CFR Part 771) (Revised 1987). Federal Highway Administration and Federal Transit Administration regulations governing the preparation of environmental impact statements and related documents.

Total Maximum Daily Loads (TMDL). For 303(d)-listed water bodies, TMDLs are developed by the Washington State Department of Ecology for the pollutants that exceed water quality standards as a means for ultimately attaining the standards.

Till. A poorly sorted, gravel-like deposit of sediment that is left behind by a glacier, which does not show stratification. Till is sometimes called boulder clay because it is composed of clay, boulders of intermediate sizes, or a mixture of these.

Total Suspended Particulates (TSP). Air pollutants that consist of solid particles (dust, lead, salts, etc.) suspended in the atmosphere. TSP is a U.S. Environmental Protection Agency's criteria air pollutant.

Total Travel Time. The total elapsed time between the beginning and ending of a trip, including travel, terminal, and waiting time.

Traction Power Substation (TPSS). An electrical station that provides the power needed to drive the trains. The substations are housed in either standalone structures, or within transit stations, typically within or adjacent to the right-of-way. The substations would typically be built about 1.5 miles apart.

Transfer Ratio. The number of boarding trips divided by originating trips.

Transfer Time. The elapsed trip time required to change between modes (e.g., bus to light rail) or to transfer between routes of the same mode (e.g., bus to bus).

Transfer. The portion of a trip between two connecting transit lines, both of which are used for completion of the trip.

Transit. A transportation system principally for moving people in an urban area and made available to the public usually through paying a fare.

Transit Center. A station with shelters where a large number of transit vehicles and passengers can be brought together with safety and convenience.

Transit-Oriented Development. The Transportation Research Board provides several definitions of transit-oriented development that emphasize high-quality walking environments, mixed land uses, and high-density developments linked to transit. Generally, transit agencies agree that what constitutes a transit-oriented development is a pattern of dense, diverse, pedestrian-friendly land uses near transit nodes that, under the right conditions, translates into higher transit patronage.

Transit Service Reliability. Reliability is defined as the degree to which transit service can be counted on for consistent, on-time performance.

Transit Street Classification System. The City of Seattle's system for designating certain streets as being important for transit. This is part of the city's overall street classification system.

Transportation Corridor (also, Corridor). The group of travel movements (or travel flows) between two or more locations. A corridor might have components or subcorridors. A corridor

includes all facilities, transit and highway, that might be used to accommodate the specified travel movement.

Transportation Systems Management (TSM). Incorporates relatively low-cost approaches to improving mobility without constructing major new transportation facilities. TSM generally emphasizes smaller physical improvements and operational changes such as intersection improvements, minor widenings, traffic engineering actions, operational changes such as queue jumps or queue bypass lanes for buses, expanded bus service, transit centers, and improved transit access.

Travel Time (in vehicle). The time required to travel between two points, not including terminal or waiting time.

Trip. The one-way movement of one person between the origin and the destination, including transfers, and the walk distance to and from the means of transportation.

Trip Demand. The number and type (public or private origin and destination) of trips measured, calculated, or forecasted in a specified area having a given land development pattern. Trip demand also depends on prevailing economic, behavioral, and attitudinal conditions.

Trip Length. The number of miles per trip. This is usually an average number for a specified trip type, area, and analysis year.

Turn Pocket. Term used to describe a traffic lane that separates turning vehicles from through lanes. For example, a left-turn pocket is also commonly known as a left-turn lane.

Unity. In visual analysis, the visual coherence and compositional harmony of the landscape.

Use of Section 4(f) Land. According to regulations of the U.S. Department of Transportation, use of Section 4(f) land is defined as: (1) acquisition of title or easement to land, or (2) in unusual circumstances, serious indirect impacts, such as increase in noise, visual intrusion, or access obstruction.

Vehicle Hours of Travel (VHT). The total vehicle hours expended traveling on the roadway network in a specified area during a specified time period.

Vehicle Mile. The amount of travel equivalent to one vehicle traveling one mile.

Vehicle Miles of Travel (VMT). The total number of vehicle miles traveled within a specific geographic area over a given period of time.

Vehicle Occupancy. The number of persons per vehicle. Usually an average number for a specified trip type, area, and analysis year.

Vehicle Throughput. The number of vehicles, usually on a highway, that get through a screenline over a short time period such as an hour.

Vibration Velocity. Vibration velocity is the basic measure of groundborne vibration. It is a measure of the rate at which particles in the ground are oscillating relative to the equilibrium point.

Vibration Velocity Level. It is generally accepted that, over the frequency range important for groundborne vibration from transit systems, human response to vibration is best correlated to the root mean square (rms) vibration velocity. In this EIS, rms vibration velocity is always expressed as decibels relative to 1 micro-inch per second.

Viewer Sensitivity. The extent of the viewer's concern for a particular view or viewshed. Viewer sensitivity to the viewed environment is classified as low, average, or high.

View. A scene observed from a given vantage point.

Viewshed. An area of land, water, or other environmental element that is visible to the human eye from a fixed vantage point.

Visual Character. Refers to identifiable visual information, including visual elements and major environmental features.

Visual Encroachment. The imposition of an object, or objects, on a view such that the view is disrupted, obstructed, or otherwise modified from its original state.

Visual Quality. Refers to the evaluation of the visual experience to the public and is described in terms of vividness, intactness, and unity. *Vividness* refers to the way landscape components combine in distinctive and memorable visual patterns. *Intactness* refers to whether the natural and human-built visual patterns form a consistent landscape, or whether highly contrasting features intrude into the view. *Unity* refers to the visual coherence and compositional harmony of the landscape considered as a whole.Visual quality is an assessment of the visual character and is categorized as low, medium, or high, as follows:

> **Low Visual Quality.** Views that lack a dominant visual character in which there is a low level of fit between disparate elements. In some cases, these views appear disorganized with features that seem out of place, or are views with some compositional harmony but include eyesore elements that can dominate one's perception.
>
> **Medium Visual Quality**. Views with a unity or compositional harmony between elements of the landscape that produce a pleasing overall impression in which encroaching elements are minor and do not substantially alter the perception of the landscape as a unit. These views lack vivid, memorable features and are generally characterized as common or ordinary.
>
> **High Visual Quality.** Views with vivid, memorable, distinctive features in a landscape with compositional harmony or that fit between elements of the landscape that is free from encroaching elements.

Volume to Capacity (v/c) Ratio. The ratio of demand flow rate to capacity for a highway or arterial facility; a v/c ratio below 1.0 means that traffic volumes are below the capacity of the roadway, when identified as greater than 1.0, the traffic volume has theoretically exceeded the carrying capacity of the roadway.

Washington State Department of Ecology 303(d) List. The federal Clean Water Act (CWA), adopted in 1972, requires states to restore their waters to be "fishable and swimmable." The CWA established a process to identify and clean up polluted waters. Every 2 years, all states are required to prepare a list of water bodies that do not meet water quality standards. This list is called the 303(d) list because the process is described in Section 303(d) of the CWA.

Appendix C

Environmental Justice Analysis

APPENDIX C – ENVIRONMENTAL JUSTICE ANALYSIS

C.1. INTRODUCTION

This appendix describes the analysis and public outreach conducted to identify potential environmental justice issues related to the construction and operation of the Lynnwood Link Extension. Environmental justice has been addressed in compliance with Presidential Executive Order 12898, Federal Actions to Address Environmental Justice to Minority Populations and Low-Income Populations (February 11, 1994); the U.S. Department of Transportation (USDOT) Order 5610.2, Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (April 15, 1997); and the USDOT Order 5610.2(a) (May 2, 2012) updating the USDOT policy to consider environmental justice principles in all programs, policies, and activities. The environmental policies of the USDOT agencies, including the Federal Transit Administration (FTA), are summarized below. The agencies are to:

1. Avoid, minimize, and mitigate disproportionately high and adverse effects on minority and low-income populations.
2. Ensure full and fair opportunities for public involvement by members of minority and low-income populations during the planning and development (including the identification of potential effects, alternatives, and mitigation measures).
3. Prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations.

FTA environmental justice policy guidance (FTA Circular C 4703.1) defines a disproportionately high and adverse effect as one that:

- Is predominantly borne by a minority or low-income population, or
- Will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low-income population.

The USDOT Order also provides guidance that "In making determinations regarding disproportionately high and adverse effects on minority and low-income populations, mitigation and enhancement measures that will be implemented and all offsetting benefits to affected minority and low-income populations may be taken into account, as well as the design, comparative impacts, and the relevant number of similar existing system elements in non-minority and non-low-income areas" (USDOT 5610.2(a) Section 8(b)).

Under USDOT Order 5610.2(a), a minority person includes persons who meet the following criteria:

- Black or African American (a person having origins in any of the Black racial groups of Africa)
- Asian American (a person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent)
- American Indian and Alaskan Native (a person having origins in any of the original people of North and South America [including Central America], and who maintains cultural identification through tribal affiliation or community recognition)
- Native Hawaiian and Other Pacific Islander (a person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands)
- Hispanic or Latino (a person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race)

The USDOT Order 5610.2 and FTA Circular C 4703.1 further define a minority or low-income population as any readily identifiable group or groups of minority or low-income persons who live in geographic proximity, or if circumstances warrant, geographically dispersed or transient persons…who will be similarly affected by a proposed Department of Transportation project, policy, or activity.

A low-income person is identified as:

- A person whose median household income is at or below the Department of Health and Human Services poverty guidelines

The U.S. Census Bureau updates poverty thresholds each year for use by the Department of Health and Human Services using the change in the average annual Consumer Price Index for All Urban Consumers. As such, separate poverty guidelines do not exist for different regions, states, counties, or cities in the United States.

The Lynnwood Link Extension would traverse the cities of Seattle and Shoreline in King County, and Mountlake Terrace and Lynnwood in Snohomish County. As of 2010, nearly 126,000 residents and an estimated 60,000 jobs were located in census tracts within 0.5 mile of the project corridor, which is anchored by major regional commercial centers at Northgate and Lynnwood. With preparation of the Lynnwood Link Extension *Alternatives Analysis Report and SEPA Addendum* (Sound Transit 2011a), Sound Transit's research has shown that neighborhoods in the project corridor have higher percentages of minority persons than the Sound Transit service district for the urbanized Snohomish, King, and Pierce counties. The occurrence of low-income populations in the corridor is similar to the Sound Transit service district. These demographic characteristics are presented in the *Title VI*

Demographic and Service Profile Maps and Charts (Sound Transit 2013). Attachment C-1 briefly describes the 18 neighborhoods that are adjacent to the project corridor. Attachments C-2 through C-12 provide demographic characteristics of the study area, and Attachment C-13 describes station access to nearby community facilities.

The following sections are provided in the rest of this appendix:

Section C.2, Regulatory Framework

Section C.3, Methodology and Approach

Section C.4, Minority and Low-income Populations

Section C.5, Outreach to Minority and Low-income Populations

Section C.6, Environmental Justice Analysis

Section C.7, Conclusions

Section C.8, References

C.2. REGULATORY FRAMEWORK

The analysis of potential impacts on minority and low-income populations was prepared following the federal, state, and regional government regulations, policy, and guidance listed below:

Federal

- Title VI of the Civil Rights Act of 1964
- Age Discrimination Act of 1975
- Americans with Disabilities Act of 1990 (ADA)
- Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended
- Presidential Executive Order 12898—Federal Actions to Address Environmental Justice to Minority Populations and Low-Income Populations
- Presidential Executive Order 13166—Improving Access to Services for Persons with Limited English Proficiency
- U.S. Department of Transportation Order 5610.2—Order to Address Environmental Justice in Minority Populations and Low-Income Populations
- Title 42 United States Code (USC) Section 4601, Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended
- Title 49 of the Code of Federal Regulations (CFR) Part 21, Nondiscrimination in Federally Assisted Programs of the Department of Transportation, Effectuation of Title VI of the Civil Rights Act of 1964
- USDOT FTA, Circular FTA C 4702.1B, Title VI Requirements and Guidelines for Federal Transit Administration Recipients (October 1, 2012)
- USDOT FTA, Final Circular FTA C 4703.1, Environmental Justice Policy Guidance for FTA Recipients (August 15, 2012)
- Community Impact Assessment: A Quick Reference for Transportation, Publication No. FHWA-PD-96-036 (September 1996)

State of Washington

- Washington Relocation Assistance—Real Property Acquisition Policy Act of 1971, as amended
- Governor's Executive Order 93-07, Affirming Commitment to Diversity and Equity in the Service Delivery and in the Communities of the State

Sound Transit

- Sound Transit/Washington State Department of Transportation (WSDOT)/Federal Highway Administration (FHWA)/FTA Environmental Action Team Issue Paper No. 36, Implementing Environmental Justice Pursuant to Executive Order 12898 and the Department of Transportation Order to Address Environmental Justice in Minority Populations and Low-Income Populations (October 4, 2001)
- Sound Transit Resolution 98-20-1: A resolution of the Board of the Central Puget Sound Regional Transit Authority adopting revised Real Property Acquisition and Relocation Policies, Procedures and Guidelines and superseding Resolution 98-20 (Adopted November 14, 2002)

C.3. METHODOLOGY AND APPROACH

For the analysis of potential impacts, Sound Transit identified a study area that extends 0.5 mile from the project alternative alignments. This area includes neighborhoods adjacent to the project corridor, but their boundaries may extend beyond 0.5 mile from the alternatives. The 0.5-mile area of effect is consistent with the project's transportation analysis and it encompasses the study areas used for other environmental topics covered in the Final Environmental Impact Statement (Final EIS).

C.3.1 Data Sources

Sound Transit used existing reports and documentation to develop the discussion of the affected environment. Much of this information was obtained from local, state, and federal agency Web pages. The following is a list of the key data sources used in the analysis:

- U.S. Census Bureau 2010 decennial census data on racial and ethnic minority populations, household types, and age, as well as basic information about housing in adjacent neighborhoods and within 0.5 mile of the alternative alignments and stations
- U.S. Census Bureau 2006–2010 American Community Survey data on languages spoken at home, limited English proficiency, country of origin of persons born outside of the United States, transit-dependency, and low-income populations for adjacent neighborhoods and populations within 0.5 mile of the alternative alignments and stations
- Washington State Office of the Superintendent of Public Instruction demographic statistics, enrollment in transitional English language programs, and participation in the federal free or subsidized lunch program for elementary school attendance in areas located wholly or partially within 0.5 mile of the project corridor
- Information about existing and planned low-income housing projects within about 0.5 mile of the project corridor from study area public housing authorities (Seattle Housing Authority, King County Housing Authority, Senior Services of Snohomish County, and Snohomish County Housing Authority)
- Location of community facilities within about 0.5 mile of the project corridor from local government Web pages as well as other Internet sites
- Information about other baseline environmental conditions from project technical analysts for transportation; land use; economics; noise and vibration; air quality and greenhouse gases; visual and aesthetics; public services, safety, and security; and parks and recreational resources

- Conceptual horizontal and vertical alignment and engineering drawings for project alternative alignments and stations from the project design engineers

Based on the U.S. Census Bureau data, minority or low-income populations were identified within 0.5-mile buffer areas or within census geographies. For reference, the 2013 Sound Transit Title VI Demographic and Service Profile Maps and Charts document shows the Sound Transit district averages are 31.13 percent minority and 11.24 percent low income. The analysis also identified more localized areas where low-income or minority populations were present, based on a combination of census information, field evaluation and community outreach. This combination of sources reflects federal environmental justice guidance highlighting the need to consider impacts on minority and low-income populations, regardless of size.

As described in Section C.5, Outreach to Minority and Low-income Populations, Sound Transit also contacted agencies, groups, and individuals as part of the project's public involvement program, and received information on the project corridor neighborhoods, historic development, demographics, and community character and resources. This information helped to identify community values, needs, and key activity centers.

C.3.2 Impact Assessment and Potential Mitigation

In Chapter 5, Section E of FTA Circular C 4703.1 (August 15, 2012), FTA recommends National Environmental Policy Act (NEPA) environmental documents include the following in their environmental justice analysis:

A. A description of the low-income and minority populations within the study area affected by the project, if any, and a discussion of the method used to identify them.

B. A discussion of all adverse effects of the project both during and after construction that would affect the identified minority and low-income populations.A description of the project's mitigation and environmental enhancement actions that will avoid or minimize potential effects (e.g., relocation program that go beyond the Uniform Relocation Act and address adverse community effects such as separation or cohesion; measures to replace community resources removed by the project).

C. A discussion of the remaining effects, if any, and why further mitigation is not proposed.

D. A discussion of all positive effects for the identified minority and low-income populations, such as an improvement in transit service, mobility, or accessibility.

E. For projects that travel through predominately minority and low-income and predominately non-minority and non-low income areas, a comparison of mitigation and environmental enhancement actions that could affect these different populations.

The analysis of potential disproportionately high and adverse effects on minority and low-income populations considers the No Build Alternative and the light rail alternatives. Direct construction and long-term effects, indirect and secondary effects, and cumulative effects were examined for all elements of the environment. The analysis also examined project benefits accruing to minority and low-income populations, which may offset effects that could not be avoided or otherwise mitigated. The primary sources for this analysis were the technical reports and the Draft and Final EIS sections prepared for transportation and other environmental elements. The analysis also considered public comments Sound Transit and FTA received on the Draft EIS, as well as information Sound Transit received through its outreach and public involvement program, which included notices to potentially affected property owners.

The effects of each environmental element were reviewed to determine if the alternatives would result in adverse effects notwithstanding proposed mitigation measures. Project impacts that were effectively mitigated would not cause disproportionately high and adverse effects.

C.4. MINORITY AND LOW-INCOME POPULATIONS

This section describes the presence of racial and ethnic minority populations as well as low-income populations in the project corridor's adjacent neighborhoods and populations within 0.5 mile of the alternatives.

C.4.1 Study Area

The study area comprises 18 neighborhoods adjacent to the project corridor (Figure C-1). Except for the Hazelwood neighborhood, they are officially designated by local governments, primarily for planning purposes. Many also have active community councils or recognized neighborhood contacts. As shown in Figure C-1, ten neighborhoods in Seattle and Shoreline are adjacent to Segment A, eight neighborhoods are adjacent to Segment B, and three are adjacent to Segment C. An estimated 126,000 residents live in the project corridor based on 2010 census tracts within 0.5 mile of the project corridor. Attachment C-1 contains brief land use, character, and demographic statistics for each neighborhood.

C.4.2 Minority Populations

The study area population is racially and ethnically diverse. Attachments C-2 through C-7 present the demographic characteristics of neighborhoods in the study area, and Attachments C-7 through C-12 provide demographic data for populations within approximately 0.5 mile of the alternative alignments and stations. Figure C-2 shows the distribution of minorities within the project corridor based on the 2010 decennial census. The map is colored to show the geographic distribution of 2010 census blocks for different proportions of minorities.

Minorities (non-White and Hispanic persons) comprise 37 percent of the study area population. Some neighborhood elementary schools reflect even higher proportions of non-White and Hispanic groups; over 19 percent of students are enrolled in transitional bilingual programs, particularly Spanish, Chinese, Korean, Vietnamese, Tagalog, and several African languages (WOSPI 2012).

Sound Transit and FTA invited federally recognized tribes to be involved in the project, and to suggest areas or facilities of particular interest or concern. Section C.5.3 discusses tribal outreach. Census data for the corridor show Native Americans comprise about 1.6 percent of the population.

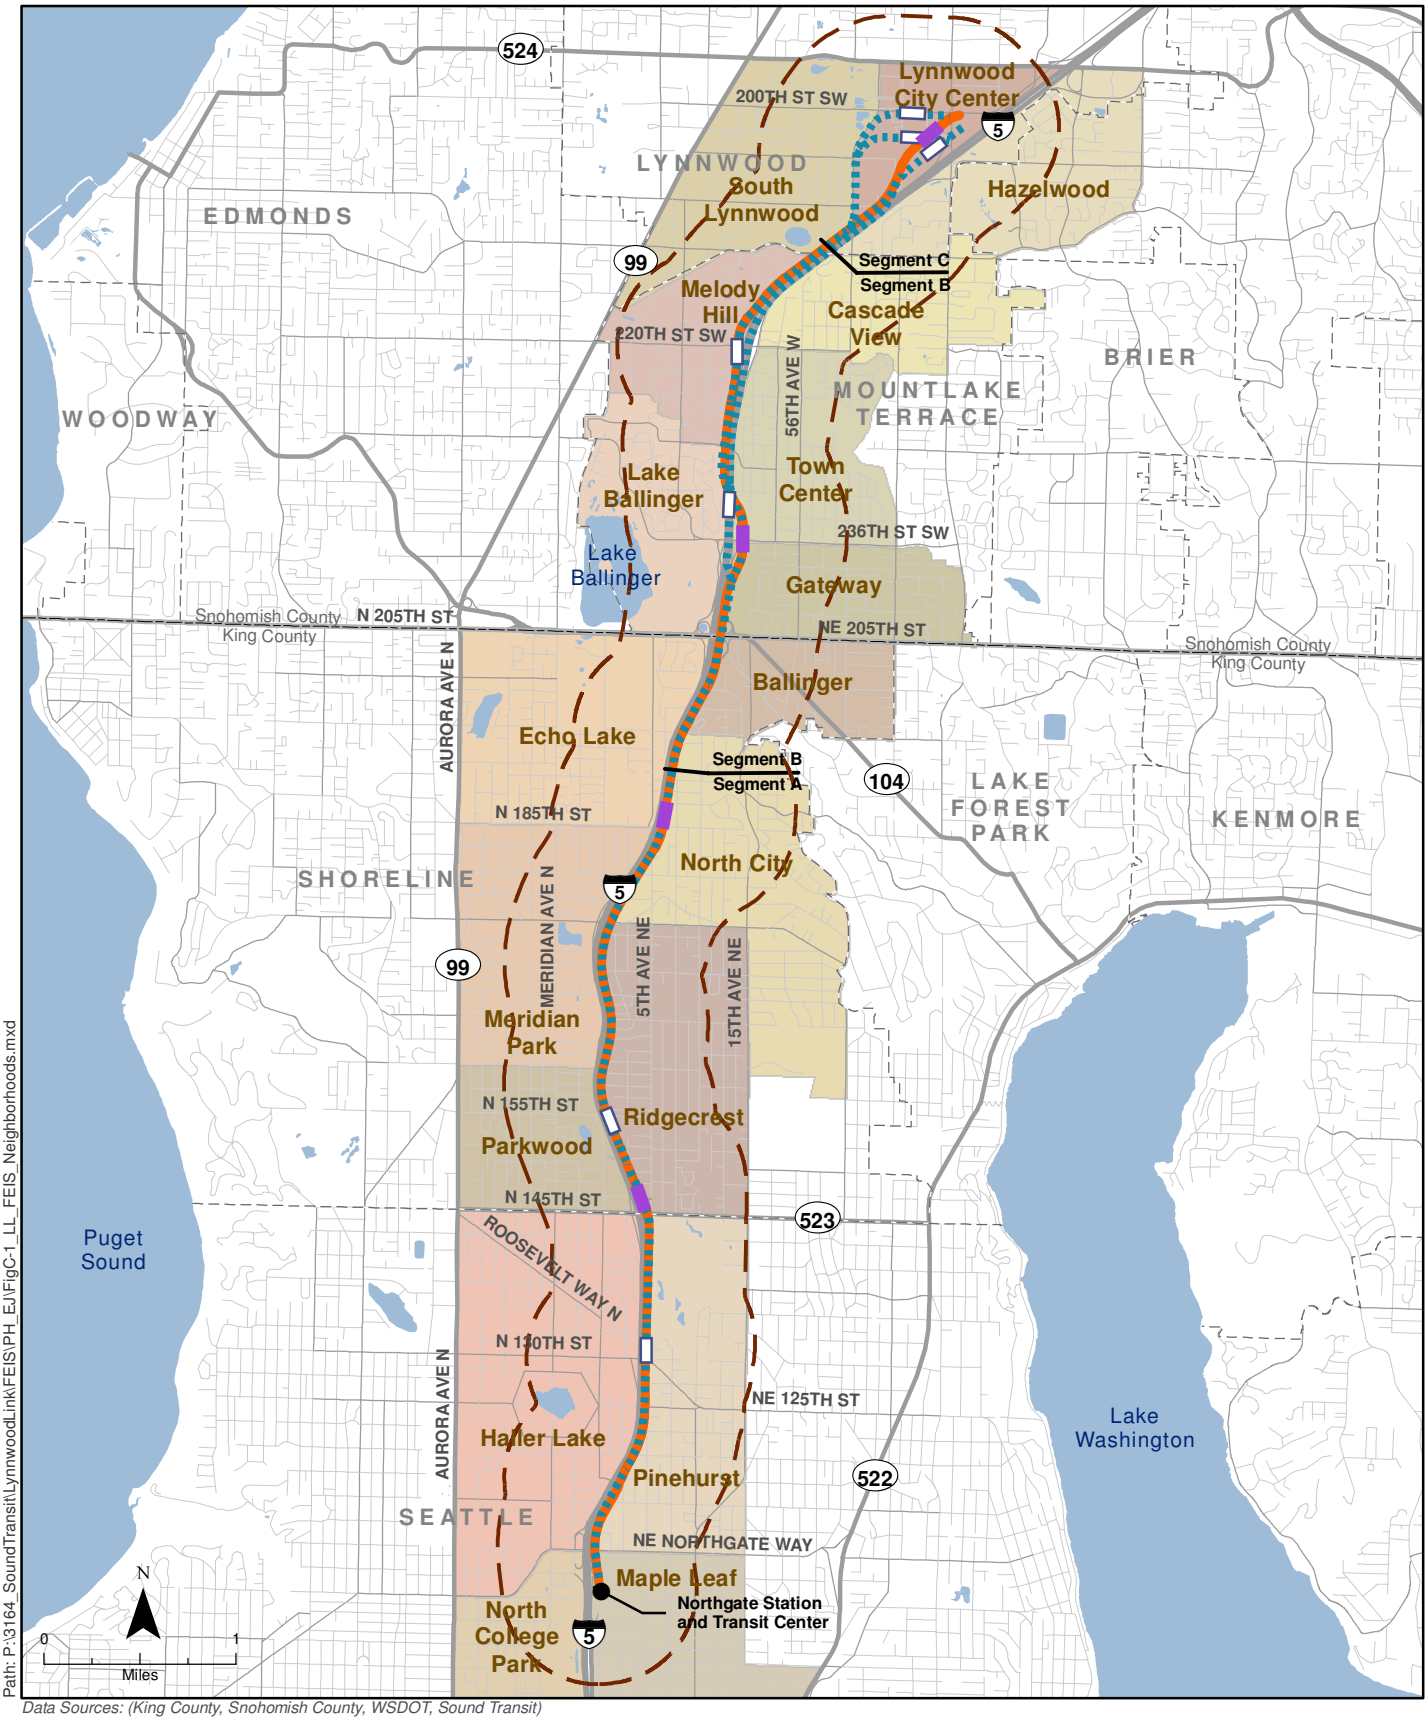

Figure C-1
Neighborhoods

Lynnwood Link Extension

The community facilities represent the racial, ethnic, and low-income populations residing in the project corridor neighborhoods. Examples include the Korean Catholic School, Berhane Hiwot Eritrean Church, Evangelical Chinese Church, Saint Mary's Coptic Orthodox Church (Egyptian), and the Vietnamese Alliance Church. These religious institutions serve families within the project corridor and the region. Some also function as ethnic cultural centers with co-located elementary schools and calendars of events that include recreational programs, craft and language classes, and folk dancing. Several of the Catholic churches have Spanish-language services and church schools with scholarship funds available for low-income students. Attachment C-13 lists community facilities close to proposed light rail transit stations.

The highest concentrations of minority populations are in the Lynnwood City Center and South Lynnwood neighborhoods, where minorities comprise more than 50 percent of the population in these neighborhoods (see Attachment C-2). Asians are by far the dominant non-White race in most neighborhoods. The proportion of populations of one other race alone or mixed race exceeding Asian populations occurs in only four neighborhoods. These racially diverse characteristics appear to be correlated with sizable Hispanic populations.[1]

In addition, Sound Transit recently conducted a Title VI analysis of the transit agency's service district (urbanized areas of Snohomish, King, and Pierce counties). Using 2010 decennial census data, this analysis determined that 31.13 percent of the district's population is minority (Sound Transit 2013).

[1] The reason for the high proportions of persons reporting in the census data that they are of some other race alone is because Hispanic persons often consider their Hispanic ethnicity a race.

C.4.3 Foreign-born and Limited English-proficient Populations

To help identify racial and ethnic minority populations, research was conducted to identify foreign-born and limited English-proficient populations. While not all such populations would be considered a minority group under the Executive Order for Environmental Justice, their communication needs were considered as the project's outreach staff developed the project's communication and public involvement plans. Foreign-born individuals comprise an estimated 21 percent of the population in census tracts adjacent to the project corridor (Census 2010b) and where data also indicate minority populations are present. Slightly more than half (54 percent) of these foreign-born individuals were born in Asian countries, mainly from China (14 percent), the Philippines (11 percent), Korea (8 percent), and Vietnam (7 percent). These population groups are sizable, each comprising over 1,000 individuals. An additional 20 percent are from Latin American countries, with nearly three-quarters from Mexico. African-born individuals, particularly from Ethiopia and Eritrea, comprise approximately 10 percent of the foreign-born population. These foreign-born individuals live throughout the study area.

About 75 percent of the study area population speaks only English, but an estimated 13 percent do not speak English very well (Attachment C-4). In some census tracts, larger proportions (exceeding 20 percent) have difficulty with English. For comparison, Sound Transit's recent Title VI analysis of the transit agency's service district determined that only 4.86 percent of the district's population either does not speak English or does not speak English well (Sound Transit 2013).

Of all persons who speak a foreign language, the largest proportion includes those who speak Spanish—an estimated 25 percent. Individual census tracts, however, have foreign-language-speaking populations exceeding 35 percent. Chinese is the most common of the Asian languages spoken, at 16 percent. Korean and Vietnamese represent 8 percent and 5 percent, respectively. An additional 10 percent speak an African language, particularly Ethiopian and Eritrean, based on statistics concerning the place of birth of foreign-born individuals. An estimated 9 percent speak Tagalog. The foreign languages in each of these six language groups are spoken by an estimated 1,000 or more persons.

Sound Transit also contacted public elementary schools to identify the three most common languages spoken by students enrolled in the school's Transitional Bilingual Program (Attachment C-12). In addition to the languages indicated above, the survey confirmed the students speak Russian, Ukrainian, and Somali.

C.4.4 Low-income Populations

Median household income (2009) was $56,300, although 11.3 percent of the study area population lives at or below the poverty level (Census 2010a, 2010b). For comparison, the recently completed Sound Transit Title VI analysis of the transit agency's service district determined that 11.24 percent of the district's population is low income (Sound Transit 2013).

Figure C-3 shows the geographic distribution of low-income populations in the study area based on 2010 census tract data. The highest densities of low-income persons are found east of I-5 at about NE 145th Street and west of I-5 between NE 205th Street and the Lynnwood City Center. Attachment C-7 lists poverty characteristics by corridor neighborhood. None of the census tracts in the corridor are predominantly low-income populations.

An additional analysis was conducted using finer-grained 2000 census block group data (Figure C-4) because the 2010 American Community Survey did not publish reliable income information at the census block group level. Figure C-4 shows the geographic distribution of different proportions of low-income populations. The older data retain value because low-income populations tend to live in clusters rather than spread broadly across the study area (Census 2011). Low-income populations are correlated geographically to the 2010 census tracts that also have higher levels of low-income populations. However, Figures C-2 and C-4 show only a loose correlation between the 2000 lower income block groups and the 2010 census blocks with more minority populations; the Lynnwood area is the only exception. Areas with higher percentages of low-income populations in 2000 block groups are generally the same as the 2010 census tracts. Areas with minority populations do not tend to greatly overlap with low-income areas, except in Lynnwood.

C.5. OUTREACH TO MINORITY AND LOW-INCOME POPULATIONS

With minorities and low-income persons in the study area, Sound Transit's public outreach program includes a targeted effort to engage these populations in the public decision-making process for the Lynnwood Link Extension. The following sections describe the targeted public involvement plan, project scoping, outreach program, and resulting Draft EIS comments from minority and low-income populations. Additional information is in the project's *Early Scoping Summary Report* (Sound Transit 2010), which was developed during the Alternatives Analysis phase of the project, and in the *Environmental Scoping Summary Report* (Sound Transit 2011c), which covered the project's public involvement activities at the initiation of the Draft EIS. Outreach to minority and low-income populations preceding the publication of the Draft EIS is described in Section C.5.3. A summary of comments on the Draft EIS is in Section C.5.4. A description of the targeted outreach to minority and low-income populations since the publication of the Draft EIS is in Sections C.5.5 and C.5.6. The Final EIS Appendix L, Public Involvement and Agency Coordination, has further detail.

C.5.1 Public Involvement Planning

In addition to the formal public meetings and outreach conducted during early scoping and environmental scoping, Sound Transit conducted over 30 stakeholder interviews with public and community service organizations at the start of the project outreach activities in late 2010. The stakeholders described a corridor that is diverse in terms of race, ethnicity, income, employment, language, culture, and knowledge and use of existing transit services. Stakeholders commented they had difficulties accessing some transit services (such as east-west, non-peak period, non-peak direction, and third-shift services). The stakeholders recommended several outreach tools and communication methods to engage community members, and they helped Sound Transit identify community organizations operating in the project corridor that are likely to represent minority and low-income individuals (Table C-1).

The *Public Involvement Plan* (Sound Transit 2011b) presents additional information on the stakeholder interviews and other outreach activities and techniques Sound Transit is using to engage the corridor's populations. Appendix D of the *Public Involvement Plan* is the *Plan for Involving Hard-to-Reach Populations*, which addresses targeted environmental justice outreach activities for minorities and low-income persons. These public involvement plan elements are considered "living" documents that will be updated as the project progresses and as those in the corridor learn more about the project and its potential impacts.

C.5.2 Project Scoping

C.5.2.1 Early Scoping

On September 27, 2010, the FTA and Sound Transit published an early public and agency scoping notice in the Federal Register to advise government agencies and members of the public that they intended to explore alternatives for improving transit service between Northgate and Lynnwood. The early scoping process was part of the Alternatives Analysis then required under Title 49 USC 5309. The *Early Scoping Summary Report* (Sound Transit 2010), published in December 2010, documents the public's comments, as well as Sound Transit's advertising, public notice, and outreach efforts.

C.5.2.2 Environmental Scoping

On September 29, 2011, Sound Transit and FTA published in the Federal Register a Notice of Intent (NOI) to prepare an EIS and initiate environmental scoping for a light rail project. The NOI invited public and agency comments on the scope of the EIS and announced the public scoping meetings. Sound Transit published the *Environmental Scoping Summary Report* (Sound Transit 2011c) in December 2011, which describes Sound Transit's outreach and the public and agency comments received during scoping. Notifications were published in the following publications: La Raza, Korean Daily, Seattle Chinese Times, Russian World Newspaper, Seattle Chinese Post, and tu Decides. Translated posters and comment forms were available in Korean, Russian, Chinese, and Spanish at the three mid-October scoping meetings.

C.5.3 Targeted Outreach Activities and Comments Prior to the Draft EIS

Since the start of the public outreach activities, Sound Transit has conducted special targeted outreach activities to engage minority and low-income populations. The following paragraphs describe these activities and the major themes of comments received.

Cinco de Mayo Festival Events

In May 2011 and 2012, the public involvement team attended the Familias Unidas Latina Resource Center and South Everett Neighborhood Center Cinco de Mayo festival events. The annual events attracted an estimated 300 to 500 attendees. With a sizable number of Spanish-speaking attendees, booth materials (fact sheet and e-newsletter) were translated into Spanish and a Spanish interpreter was present to answer questions. Most people commented that they were excited about the planned Northgate Station and light rail extension to Lynnwood. Specific comments, however, raised the following concerns: safety and security of transit users, earthquake preparedness, transit use by disabled persons, use of transit midday, noise impacts, and the importance of providing shelter at transit stations. People asked about the project routes, stations, and implementation schedule; project staff added names and contact information to the stakeholders list for future e-newsletter updates (English/Spanish versions). The translated materials were essential because approximately a quarter to half of the interactions were conducted in Spanish.

Ethnic Elders Resources Fair

On October 1, 2011, and September 29, 2012, the public involvement team attended the annual Ethnic Elders Resources Fair at the Everett Community College. Interpreters were available at the 2011 event, and a Spanish-speaking staff member assisted at the booth. The 2012 fair included workshops in Tagalog, Chinese, Vietnamese, Korean, Spanish, Russian, and English to accommodate the diverse elderly residents. Most booth visitors were identified as Korean, Vietnamese, or Russian; many spoke limited English but were aided by translators. The project team mostly fielded inquiries on how to get to and from various destinations using existing transit services.

Drop-in Meetings, Community Briefings, and Project Updates

Additional targeted outreach activities focused on going directly to centers, public venues and events within the communities to help reach individuals that might not be reached through other approaches, and to make it easier for all members of the community to participate in project planning and decision-making. Many of the informal comments on the project during meetings and community briefings in areas

with low-income or minority populations pertained to the final decision-making process, parking at the proposed stations, construction noise and traffic, and property acquisition. This included the following:

- In March 2012, the public involvement team organized drop-in meetings to be held in conjunction with community classes. One meeting was held at the Lynnwood Library at the same time as a Korean computing class; another meeting was held at the Mountlake Terrace Library concurrent with an English as a Second Language class.
- In December 2012, project posters were distributed to a number of organizations providing services to minority and low-income populations in the project corridor. Based on new corridor analysis, the number of languages used to translate printed matter increased from four (Spanish, Korean, Chinese, and Russian) to six (Spanish, Korean, Chinese, Traditional Vietnamese, Tagalog, and Amharic). These same languages were used in three traveling displays placed at various community centers during December 2012. The public involvement team also offered community briefing meetings to over 70 study area community organizations. These included ethnic, faith, neighborhood, and veterans groups; senior centers and public housing authorities; and social service agencies. Some community groups declined offers for briefings, but requested information by email such as copies of briefing meeting materials, newsletters, and links to the project Web site. Others asked to be contacted again in the future. Translations were provided for six foreign languages at some meetings.
- In April 2013, Sound Transit prepared a new project flier that was posted to the project's Web page, mailed to over 83,000 businesses and residents, and emailed to over 2,400 email subscribers. The flier noted the upcoming publication of the Draft EIS and announced the pending comment period and public hearings to be held during the summer of 2013, and included messages in six languages. The flier also stated that property owners who would be affected by potential acquisitions would receive a special letter in advance of the Draft EIS publication and provided with an opportunity to contact or meet with Sound Transit staff.
- Prior to Draft EIS publication, Sound Transit sent letters to all property owners that could be impacted by a full or partial acquisition by any of the alternatives. More than half of those affected contacted Sound Transit staff, and community outreach specialists as well as members of Sound Transit's real estate group worked directly with the potentially affected parties to review the impacts of various alternatives. Staff encouraged them to participate by

making public comments, and they explained the property acquisition process, including Sound Transit's relocation assistance program.

Tribal Outreach

As described in the *Lynnwood Link Extension Coordination Plan* (Sound Transit 2012), FTA and Sound Transit contacted the following federally recognized tribes during environmental scoping: Muckleshoot Indian Tribe, Snoqualmie Tribe, Suquamish Tribe, Tulalip Tribes, and the Yakama Nation. FTA invited these tribes to become participating agencies, but to date, tribal comments have only been received from the Muckleshoot Indian Tribe; the Tribe stated their concerns about impacts on fisheries, habitat, and water quality during scoping, and they also provided comments on an early agency review of the Draft EIS. Sound Transit and FTA met with the Muckleshoot Indian Tribe to further discuss ecosystem and fisheries issues and define additional coordination and analysis for the Draft EIS. In conjunction with the Section 106 process required under the National Historic Preservation Act, Sound Transit and FTA also contacted representatives from the Duwamish Tribe and the Snohomish Tribe, which are not federally recognized.

C.5.4 Publication of the Draft EIS and Comments

The Draft EIS was published July 26, 2013 and was followed by a 60-day comment period ending on September 23, 2013. Sound Transit held public meetings at transit and ADA-accessible public locations in each of the four cities in the project corridor. (See Chapter 6 for more detail on public involvement, and Chapter 7 for a summary of public comments.) Over 600 comment letters were received from government agencies, community organizations, and individuals. Many of the comments expressed a particular preference for one or more of the project alignment and/or station alternatives.

Senior Services, a non-profit agency supported by United Way of King County, submitted comment summaries from two transit planning events held in Shoreline—one for the Korean community (conducted in Korean, not English) and the other for persons of limited incomes, including many disabled persons. Key concerns for the transit facilities included linkage with bicycle and pedestrian trails, ADA-compliance, disabled parking, public safety, and traffic signals to aid vision- and hearing-impaired users. Recommendations for future transit-oriented development near the proposed stations included mixed density and affordable housing, coffee shops, a Korean grocery store, and recreation and fitness facilities.

In addition, the Muckleshoot Indian Tribe sent a comment letter concerning discussion of natural resource issues in the Draft EIS. The Tribe stated Alternative C1 would likely have the fewest impacts to salmon and salmon habitat, and would be preferred by the Tribe. The Tribe requested involvement in future

design efforts related to state-owned culvert replacement and mitigation design to address unavoidable impacts to streams, floodplains, wetlands, and buffers. The Tribe also requested stormwater water quality treatment methods to maximize the removal of heavy metals and oils that may adversely affect salmon.

C.5.5 Targeted Outreach After Publication of the Draft EIS

Sound Transit continued its outreach activities following the Draft EIS release and the subsequent public comment period. These efforts included further outreach to potentially impacted property owners; outreach accompanying fieldwork along the corridor; flyers and newsletters; booths at fairs and festivals throughout the communities; briefings at community group meetings; displays and kiosks at various community venues, with regularly updated project information; and four community drop-in events at libraries and community centers. The kiosks were first displayed in December 2012 and will continue to be displayed at least up to final design of the project.

Following the Sound Transit Board identification of the Preferred Alternative and its subsequent preliminary engineering, Sound Transit sent letters to all property owners newly identified as potentially affected by the refined alternatives. Similarly, with the release of the Final EIS, Sound Transit did an additional mailing to all potentially affected property owners for all of the alternatives evaluated in the Final EIS; this mirrored Sound Transit's mailings prior to the Draft EIS publication.

C.5.6 Publication of the Final EIS and Future Outreach

Public notices alerted the public to the availability of the Final EIS. The notices will be mailed to project area residents and businesses. Sound Transit also notified all commenters and sent a Final EIS Summary and CD to them. The Final EIS will be available for public review in a variety of formats and locations, including the Sound Transit offices and the project Web site (www.soundtransit.org/Projects-and-Plans/Lynnwood-Link-Extension). For additional information, see the Final EIS Fact Sheet.

Targeted outreach activities will continue after the publication of this Final EIS through project final design, construction, and start of operations.

C.6. ENVIRONMENTAL JUSTICE ANALYSIS

This section discusses anticipated adverse and beneficial effects on minority and low-income populations and neighborhoods.

C.6.1 Summary of Potential Impacts

The analysis of potential environmental impacts follows the methodology described in Section C.3.3, Environmental Justice Impacts. Table C-2 identifies potential adverse project effects on human health and the environment and describes impacts on minority and low-income populations. The proposed mitigation and enhancement measures listed in Table C-2 would reduce or minimize the effects on the population as a whole as well as minority and low-income populations. In addition, Table C-2 indicates offsetting benefits for minority and low-income populations. As shown in Table C-2, the project is not anticipated to result in high and adverse effects after mitigation. The impacts are expected to be similar in kind and magnitude as those that would be experienced by the general population living or working along the corridor. Sound Transit's mitigation commitments would avoid and minimize potential high and adverse environmental impacts.

Table C-2. Environmental Impacts, Potential Mitigation, and Benefits for Minority and Low-income Populations

Element of the Environment	Impacts	Impacts on Minority and Low-income Population(s)	Potential Design Measures, Mitigation and Enhancement	Benefit(s) to Minority and Low-income Population(s)
Transportation - Streets - Transit - Bicycle and Pedestrian	• For the Preferred Alternative and other alternatives, increased local street congestion, and increases in bicycle and pedestrian activity around transit stations, particularly with passenger drop-off/pick-up activity, nearby bus stops, and park-and-ride facilities at some transit stations. • Local and arterial intersections affected (below acceptable level of service [LOS]). • Existing on-street and off-street parking removed. • Spillover parking in neighborhoods near stations may occur. • Temporary construction impacts from reduced highway and local roadway capacity, truck traffic, loss of parking, road and nighttime closures, changes in bus routes, reduced capacity of transit park-and-ride bicycle and pedestrian facilities, and changes to property access. • Temporary closure of the existing pedestrian bridge over I-5 at NE 195th Street.	Same as for general populations in the affected neighborhoods.	• Reconfiguration of the northbound NE 130th Street off-ramp under the Preferred Alternative and Alternatives A1, A5, and A10 to improve highway operations; similar improvements for the NE 145th Street interchange. • Mitigation for congestion impacts on local and arterial street intersections includes improvements to No Build conditions or better. • Parking management strategies would be coordinated in station areas to minimize spillover parking in neighborhoods. • Bicycle and pedestrian improvements would be implemented at transit stations consistent with system access plans to accommodate projected increase in bicycle and pedestrian travel associated with the proposed project.	• Regional reduction in automobile travel; similar reduction in bus transit in the high-occupancy vehicle (HOV) lanes would increase capacity and/or improve operations. • Increased person throughput (up to 10 percent) in the I-5 corridor, particularly in evening peak periods. • Direct rail service from Lynnwood to Northgate, the University District, Capitol Hill, downtown Seattle, the Rainier Valley, and Seattle-Tacoma International Airport. • Substantially improved transit service reliability in the corridor, increased frequency throughout the day (5- to 10-minute headways), and daily service extended to19 hours. • Travel time savings to regional destinations, e.g., from Lynnwood to Northgate and downtown Seattle—an estimated 10 to 17 minutes, respectively. • A new ADA-compliant bicycle/pedestrian bridge from 232nd Street SW to the Mountlake Terrace Freeway Station (Alternative B4) in the I-5 median (none now).

Table C-2. Environmental Impacts, Potential Mitigation, and Benefits for Minority and Low-income Populations

Element of the Environment	Impacts	Impacts on Minority and Low-income Population(s)	Potential Design Measures, Mitigation and Enhancement	Benefit(s) to Minority and Low-income Population(s)
Acquisition, Displacement, and Relocation	• Segment A full acquisitions of 65 to 81 parcels and displacement to 109 to 126 residences. • Segment B full acquisition of 1 to 6 parcels and displacement of 0 to 5 residences. • Segment C full acquisitions of 1 to 80 parcels and displacement of 0 to 77 residences, 1 to 31 business or other. • For the Preferred Alternative and all Segment A alternatives, 49 of the 124 residential displacements would be single-occupancy rooming house units.	• Properties to be acquired are in areas where low-income and/or minority populations are present, and some individuals from these populations are likely to be affected the same as the general population.	• Property owners and displaced residents and businesses would receive compensation and relocation assistance consistent with federal and state regulations, and Sound Transit's Real Estate Property Acquisition and Relocation Policy. • Relocation policies require replacement housing to be affordable for the displaced resident. • Market research indicates there would be opportunities for residents and businesses to successfully relocate within the general area, including lower-cost, owner-occupied, and rental housing.	None.
Land Use	No adverse impacts.	No adverse impacts.	None required.	None.
Economics	• Property acquisition would displace between 9 and 31 businesses, with 60 to 108 employees, in Segment C. • Property tax reductions: 0.1percent in Segment A, 0 to 0.4 percent in Segment B, and 0.2 to 1.1 percent of city revenues. • Temporary increase in construction impacts on traffic congestion and reroutes, noise, vibration, dust, and visual obstruction that would affect nearby businesses, particularly near the proposed stations at 220th Street SW and the existing Lynnwood Transit Center.	• Businesses that would be displaced in Segment C are located in a neighborhood that is 58.3 percent minority and 18.6 percent low income. • Based on the types of businesses displaced and the demographic characteristics of the corridor, some employees of displaced businesses could be minority and/or low-income persons.	• See potential mitigation for transportation (Chapter 3); acquisitions, displacements, and relocations (Section 4.1); and noise and vibration (Section 4.7) in the Final EIS. • Other construction impact mitigation measures detailed in Section 4.3, but include programs and outreach with businesses to develop a detailed mitigation plan and to coordinate with businesses during construction to minimize impacts that could disrupt business activities. • Maintain access as much as possible to each business and coordinate with businesses during times of limited access during construction.	• Opportunities for redevelopment in station areas, particularly at 220th Street SW and near the Lynnwood Transit Center, may attract new businesses and jobs to neighborhoods near station areas. • Improved access to employment centers and expanded employment opportunities for minority and low-income persons residing in the project corridor. • Federal expenditures associated with construction could result in over $1.233 billion in direct expenditure and annual employment of over 1,200 jobs in the region. • Positive construction effects include construction worker

Table C-2. Environmental Impacts, Potential Mitigation, and Benefits for Minority and Low-income Populations

Element of the Environment	Impacts	Impacts on Minority and Low-income Population(s)	Potential Design Measures, Mitigation and Enhancement	Benefit(s) to Minority and Low-income Population(s)
				expenditures at nearby businesses.
Social and Neighborhood	• Few to minor effects on community facilities and services. • No cohesion impacts because alternative alignments would not create neighborhood barriers or otherwise divide communities. • No displacement of community facilities. • Temporary construction impacts, including dust, light/glare, noise, and traffic congestion.	• Same as those experienced by the general population.	• See potential mitigation under Acquisitions, Displacements, and Relocations (Section 4.1) in the Final EIS. • Potential mitigation for other elements of the environment (air quality, noise, visual, transportation, etc.) would reduce construction impacts affecting access or the quality of life in adjacent neighborhoods.	• Improved access to some community located in the project corridor as well as other neighborhoods served by the Link system.
Visual and Aesthetics	• Light rail alternatives would have areas with high visual impacts. • Removal or thinning of mature trees and dense vegetation currently screening I-5; changed views from the highway; views where the light rail facility or stations would dominate, or where new parking structures are near single-family residences; new and/or taller noise barriers or retaining walls; and lighting. • Temporary construction impacts include clearing, demolition, construction of new facilities, equipment use and storage, material hauling and storage, construction staging areas, and lighting along the corridor.	• Same as those experienced by the general population.	• Aesthetic plans with detailed options for applying various impact minimization measures, including replacement landscaping, would be developed in consultation with affected jurisdictions and communities. • Construction mitigation measures would include shielding light sources and designing construction screens or barriers to limit visibility of work areas.	None.

Table C-2. Environmental Impacts, Potential Mitigation, and Benefits for Minority and Low-income Populations

Element of the Environment	Impacts	Impacts on Minority and Low-income Population(s)	Potential Design Measures, Mitigation and Enhancement	Benefit(s) to Minority and Low-income Population(s)
	• Although areas along the guideway and station areas would be landscaped, it would be 15-20 years before mature landscaping would characterize the corridor and 30 or more years before evergreen trees would mature to current screening conditions.			
Air Quality and Greenhouse Gases	• No operational impacts. • Temporary construction impacts include increased levels of pollutants, particularly emissions from construction equipment and trucks, and fugitive dust and particulates associated with grading and excavation.	Same as those experienced by the general population.	• No mitigation is required or proposed for light rail operation. • Potential construction mitigation includes mitigation measures and best management practices (BMPs) to control particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), and emissions of carbon monoxide and nitrogen oxides.	Improved air quality in the longer term due to reduced criteria pollutants and mobile source air toxics compared with No Build Alternative conditions.
Noise and Vibration	• There are noise- and vibration-sensitive properties along the entire corridor. • Without mitigation, noise impacts would occur. The affected sites are mostly in Segment A. No vibration impacts are expected in either Segment B or C. • Construction-related noise and vibration.	No adverse impacts are expected with project design and mitigation measures that control and limit noise and vibration levels.	• Adverse noise and vibration effects would be mitigated by installing noise walls, special trackwork, sound insulation and other noise abatement measures. • Construction activities would implement a variety of measures to comply with local regulatory requirements and ordinances. Any nighttime construction activities would comply with local government ordinances and nighttime noise variances.	New and relocated noise barriers that mitigate transit noise could also reduce noise levels from traffic on I-5 and other nearby roadways, potentially reducing noise levels to below existing ambient levels.

Table C-2. Environmental Impacts, Potential Mitigation, and Benefits for Minority and Low-income Populations

Element of the Environment	Impacts	Impacts on Minority and Low-income Population(s)	Potential Design Measures, Mitigation and Enhancement	Benefit(s) to Minority and Low-income Population(s)
Ecosystem Resources	• Low potential for adverse effects on vegetation, wildlife or fish habitat after mitigation. • Limited wetland and wetland buffer impacts. • Stream crossings are all elevated, and most construction is outside of stream channels. • The project would be designed to comply with all federal, state, and local regulations controlling potential risks to ecosystem resources.	No adverse impacts to active fisheries, including fishing areas used by tribes or others.	• Project design measures would avoid and minimize impacts on environmentally sensitive resources and provide compensatory mitigation measures where adverse effects are unavoidable for no net loss of ecosystem functions. • Construction BMPs would minimize impacts such that no additional mitigation measures would be required.	None.
Water Resources	The project would result in temporary construction and long-term increased pollution-generating and non-pollution-generating impervious surfaces, changes in water quality and flow control facilities, and placement of columns supporting elevated tracks in stream buffers and Scriber Creek flood plain.	No adverse impacts.	• Project would be designed to comply with all federal, state, and local regulations, which would prevent or minimize potential impacts to water resources through project planning, design, and the application of required BMPs (see Appendix I-4.9). • Measures for mitigating construction impacts include compliance with the NPDES permit program. • Construction BMPs.	None.
Energy Impacts	• The light rail alternatives would result in lower energy consumption regionally. • No adverse energy construction impacts.	No adverse impacts.	None required.	Overall reduction in energy consumption compared to the No Build Alternative would benefit all populations.
Geology and Soils	• Low risks for adverse impacts from steep slope and landslide hazard areas. • Corridor located in seismically active region. • Some construction risks from erosion, slope instability, seismic ground-shaking, vibration, settlement, temporary excavations, and dewatering.	No adverse impacts.	Geology and soils risks would be avoided or minimized with the use of engineering design standards and BMPs.	None.

Table C-2. Environmental Impacts, Potential Mitigation, and Benefits for Minority and Low-income Populations

Element of the Environment	Impacts	Impacts on Minority and Low-income Population(s)	Potential Design Measures, Mitigation and Enhancement	Benefit(s) to Minority and Low-income Population(s)
Hazardous Materials	• Segment C alternatives require acquisition of all or parts of three to four parcels with higher risk for remaining hazardous materials. • Contamination may be encountered during construction. • Construction activities could cause accidental release or spill of hazardous materials along the project corridor.	Same as those experienced by the general population.	• Environmental due diligence for properties before acquisition, and where hazardous materials are present, management plans and actions would be implemented. • Contractors would be required to develop plans to implement BMPs to ensure management of hazardous materials during construction is consistent with state and federal regulations.	In some neighborhoods with minority and low-income populations, acquired parcels with hazardous materials could be cleaned up.
Electromagnetic Fields	• No adverse effects because no sensitive equipment would be in operation within 1,000 feet of alternative alignments and stations. • Electromagnetic fields would be below exposure guidelines for human health.	No adverse impacts.	None required.	None.
Public Services, Safety, and Security	Potential construction effects on emergency response times and routes, particularly near Shoreline Fire Department Fire Station No. 65 on NE 155th Street.	Same as experienced by the general population.	Minimize construction impacts through coordination with police, fire, and local emergency response services.	None.
Utilities	• No long-term impacts on utilities under any segment alternative, although some utility facilities may be relocated during construction to ensure long-term access. • Short-term temporary construction impacts on utilities.	Same as for the general population.	• Coordination with utilities during final design. • Design measures to minimize the effects of stray current. • Potholing and preconstruction surveys during final design. • Construction of temporary utility lines, if needed, to ensure continuous service or to minimize disruptions.	None.
Cultural, Archaeological, and Historic Resources	None.	No adverse impacts.	Develop Inadvertent Discovery Plan prior to ground-disturbing construction activities.	None.

Table C-2. Environmental Impacts, Potential Mitigation, and Benefits for Minority and Low-income Populations

Element of the Environment	Impacts	Impacts on Minority and Low-income Population(s)	Potential Design Measures, Mitigation and Enhancement	Benefit(s) to Minority and Low-income Population(s)
Parks and Recreational Resources	• Jackson Park Golf Course and a nearby trail affected by changed views for elevated alternatives. Northacres Park and Twin Ponds Park could be impacted by transit patrons parking under some alternatives. • Ridgecrest Park affected by acquisition of a sliver of property, changed views, and partial removal of a berm and mature trees, but park and facility activities can continue. • Shoreline Stadium affected by a sliver parcel acquisition for the Preferred Alternative and A1; reduced parking and removal of a small space adjacent to the track, but no change in use.The Interurban and Scriber Creek trails in the Lynnwood area would each be crossed overhead by elevated guideways, but trail functions would not change. • Scriber Creek Park affected by elevated guideway columns in the park under Alternative C1; alignment over wetland area adjacent and south of park under Alternative C2 would affect views from the park. • Temporary construction impacts would include visual, noise, traffic congestion, and temporary trail detours or modified park access.	Same as experienced by the general population.	• Sound Transit would work with the park owner or manager to minimize operation and construction impacts and provide compensation where parkland must be acquired. • Potential unauthorized parking at Northacres Park and Twin Ponds Park would be addressed by signage and parking control and management measures. • Restoration of affected park and trail areas. • For temporary trail and partial park closures during construction, Sound Transit would coordinate with appropriate local jurisdictions to develop detours or alternate access and provide public information and signage to allow for continued use.	Several of the parks would receive improvements as part of the proposed mitigation developed to address impacts that would benefit minority and low-income populations to the same degree as the general population.

C.6.2 Transit Service Benefits

Overview

The Lynnwood Link Extension would improve transportation for people living, working, and shopping in the study area. The new light rail line would particularly provide transit benefits for people living and working within 0.5 mile of the proposed transit stations, which could be easily accessed by foot. For others, transit station connections would be provided by bicycle, bus service, taxi, and private vehicle.

As discussed in the *Lynnwood Link Extension Transportation Technical Report*, project transportation benefits include the following:

- Increased transit access to regional employment opportunities, activity centers, and retail shopping districts
- Increased person throughput within the project corridor, particularly transit users
- Increased reliability for travel by transit
- Increased transit services with increased frequency compared to bus transit services

Increased transit services through extended hours of operation throughout the corridorThe following subsections discuss these benefits to minority and low-income populations, many of whom are dependent upon transit.

Improved Access to Regional Activity Centers

The Lynnwood Link Extension connects the major communities of north Seattle and the cities of Shoreline, Mountlake Terrace, and Lynnwood. Moreover, the light rail extension connecting to the Central Link light rail system provides service to regional activity centers at Northgate, the University District, downtown Seattle, communities to the south, and the Seattle-Tacoma International Airport. The East Link extension to Mercer Island, Bellevue, and Overlake, as well as the Federal Way Link extension, further expand the number of regional activity centers accessible by rail when the Lynnwood Link Extension opens for operation.

The light rail system improves access to many community and regional activity centers. The Lynnwood Link, Central Link, and East Link extensions together have light rail stations within 0.5-mile walking distances of the following:

- Higher education: North Seattle Community College, University of Washington, Seattle Central Community College

- Health facilities: Group Health Lynnwood Medical Center, UW Medical Center, UW Neighborhood Shoreline and Northgate Clinics, Polyclinic at Northgate, Group Health at Bellevue, Overlake Medical Center and Hospital, University Hospital, and other downtown Seattle hospitals and clinics
- Shopping: Lynnwood City Center, Mountlake Terrace Town Center, Northgate Mall, University District, and downtown Seattle
- Sports stadiums: Husky Stadium, Century Link Field and Event Center, and Safeco Field
- Museums and cultural venues: Burke Museum of Natural History, Henry Art Gallery, Meany Hall for the Performing Arts, Floyd and Delores Jones Playhouse, Seattle Art Museum, Frey Art Museum, Benaroya Hall, 5th Avenue Theatre, Paramount Theatre, and Washington State Convention Center

Minority and low-income populations, especially those who are transit-dependent, would benefit from the more reliable, frequent, and faster access by light rail to these many community and regional activity centers. They would also have improved access to employment opportunities associated with the regional activity centers in Lynnwood, Northgate, University District, downtown Seattle, East King County including Bellevue and Overlake, and the Seattle-Tacoma International Airport. Attachment C-13 indicates the station access to nearby community facilities.

Improved Access to Transit

Walking to the new transit stations would provide residents within 0.5 mile of the station the most reliable access to the new light rail service because they could control their departure and travel times, and would not be dependent on making connections with other modes of transportation.

Table C-3 lists the total population residing within 0.5 mile of the proposed light rail stations for the segment alternatives and the proportions of the population estimated to be minority and low income. Based on this analysis, all of the alternatives would improve access to transit services for minority and low-income populations. In Segment B, the Preferred Alternative optional station and Alternative B2A would provide access to greater numbers of minority populations than the other Segment B alternatives due to the station at 220th Street SW. The alternatives in Segment C would substantially improve access to transit services to minority and low-income populations due to the substantially higher concentration of these populations within 0.5 mile of any of the three transit station locations in Lynnwood.

Table C-3. Access to Light Rail Stations for Minority and Low-income Populations

Segment	Number of Stations	Total Census Block Population Within 0.5 Mile of Stations	Percent Minority	Percent Low Income
Segment A				
Preferred Alternative	2	12,300	36.1	10.1
Alternative A1	2	12,300	36.1	10.1
Alternative A3	2	12,300	36.1	10.1
Alternative A5	3	18,900	35.8	10.3
Alternative A7	3	18,900	35.8	10.3
Alternative A10	3	17,300	36.6	10.3
Alternative A11	3	17,300	36.6	10.3
Segment B				
Preferred Alternative	1	4,800	31.1	9.7
Alternative B1	1	4,800	31.1	9.7
Alternative B2	1	4,800	31.1	9.7
Alternative B2A	2	8,800	33.4	12.4
Alternative B4	1	5,000	28.3	10.0
Segment C				
Preferred Alternative	1	4,900	48.1	11.8
Alternative C1	1	4,200	47.7	11.8
Alternative C2	1	4,200	48.6	11.8
Alternative C3	1	4,600	48.7	11.8

Source: U.S. Census Bureau, 2010 Decennial Census and 2006-2010 American Community Survey.
Note: Calculations of the total population residing within 0.5 mile of the stations for each alternative excludes overlapping areas where residents may be within 0.5 mile of more than one station. In addition, the 2010 census blocks have been aggregated to best fit the 0.5-mile buffer area surrounding the stations. Estimates of portions of the census block populations residing within 0.5 mile of the stations were not calculated.

Improved Transit Service Hours and Headways

Currently, three bus transit agencies operate in the Lynnwood Link corridor—King County Metro, Community Transit, and Sound Transit (express buses). Several King County Metro bus routes operate during peak, non-peak, and evening hours in King County. Community Transit primarily operates peak-direction, peak-period buses that serve portions of the corridor, including local buses that provide service in Snohomish County communities during peak and non-peak periods, but not during the evening hours. Sound Transit's ST Express regional bus service provides two-direction, all-day service between major regional destinations with no more than two buses per hour. Midday, off-peak, and weekend transit service is less frequent than during the peak periods.

In contrast, light rail service would serve the entire corridor during peak, daytime, and evening hours with at least four trains per hour from about 5 am to 12 midnight—an estimated 19 hours per day. The light rail would operate with midday headways of 5 to 10 minutes, compared to 15 minutes for the most frequent bus routes and 30- to 60-minute headways for most non-peak bus routes. The light rail

service would be available for more hours of the day than existing bus service, particularly in the northern portion of the corridor in Snohomish County. This improved transit service would benefit all patrons, including low-income and transit-dependent persons, particularly those traveling to and from jobs during non-peak periods, to and from multiple places of employment each day, or to and from jobs with swing and graveyard shifts.

Comparative Costs of Transit Service Fares

Light rail fares have not yet been established for the Lynnwood Link Extension. Existing fare formulas for the light rail service on Link are less expensive than equivalent bus services, and Sound Transit anticipates that Link fares will remain similar to or less expensive than typical bus fares. As of March 2015, low-income residents may qualify for reduced fare transit passes on King County Metro and Sound Transit.

Transit Travel Time Savings

On average, 2035 peak period transit travel time for the Preferred Alternative and other light rail alternatives for trips between Lynnwood and Shoreline to downtown Seattle would provide an estimated 5- to 16-minute travel time savings compared to the No Build Alternative.

For the Final EIS, Sound Transit updated the analysis of the specific transit travel time savings benefitting minority and low-income populations. The measure of travel time savings is an output of the Sound Transit Ridership Model (2011) and is referred to as user benefits. The updated modeling analysis incorporates the Puget Sound Regional Council's new July 2013 Land Use Baseline. The model measures the total number of annual person-hours of travel time savings for the model forecast analysis zones (FAZs). For example, if the user benefit is 1,000, then transit users residing in the FAZ as a group benefitted by saving 1,000 hours of travel time over 1 year. Figure C-5 illustrates travel time savings in forecast year 2035 in the project corridor for the Preferred Alternative, other alternatives would be similar.

The travel time saving benefits were divided into four categories of annual person-hours: 0 to 25,000; greater than 25,000 to 50,000; greater than 50,000 to 75,000; and greater than 75,000. The 2035 average for the 165 FAZs was approximately 37,000 annual person-hours for the study area as calculated by the travel demand forecast model. The FAZs with greater than 75,000 annual person-hours represent the highest benefits attributable to the light rail alternatives.

Transit Travel Time Savings for Minority Populations

To assess the potential effects on travel time savings, or user benefits, for minority populations, Figure C-2 was visually compared to the map of corridor 2035 travel time savings shown in Figure C-5. A review of the literature indicates that it is reasonable to assume the 2010 locations of minority populations represent the locations of these populations in the future. Figures C-2 and C-5 show that the minority populations are located in FAZs with the two highest categories of travel time savings. Together, this analysis confirms that transit travel time benefits for minority populations are positive throughout the project corridor and generally are among the highest category of user benefits.

Transit Travel Time Savings for Low-income Populations

A similar analysis was conducted to assess potential effects on transit travel time savings for low-income populations. Figure C-5, which shows travel time savings in 2035, was compared to Figures C-3 and C-4 showing the distribution of low-income populations based on the 2010 decennial census and the 2006–2010 American Community Survey, respectively. Moreover, neighborhoods low income populations correlate to those with transit dependent populations, i.e., households with no access to a personal vehicle (Attachment C-7). In particular, the Pinehurst, South Lynnwood, and Lynnwood City Center neighborhoods have more than 17 percent of the population at or below poverty level, and the transit dependent populations also make up more than twice the study area average. Again, comparison to the travel time savings map shows benefits for low-income populations are positive throughout the corridor and generally are among the highest category of user benefits.

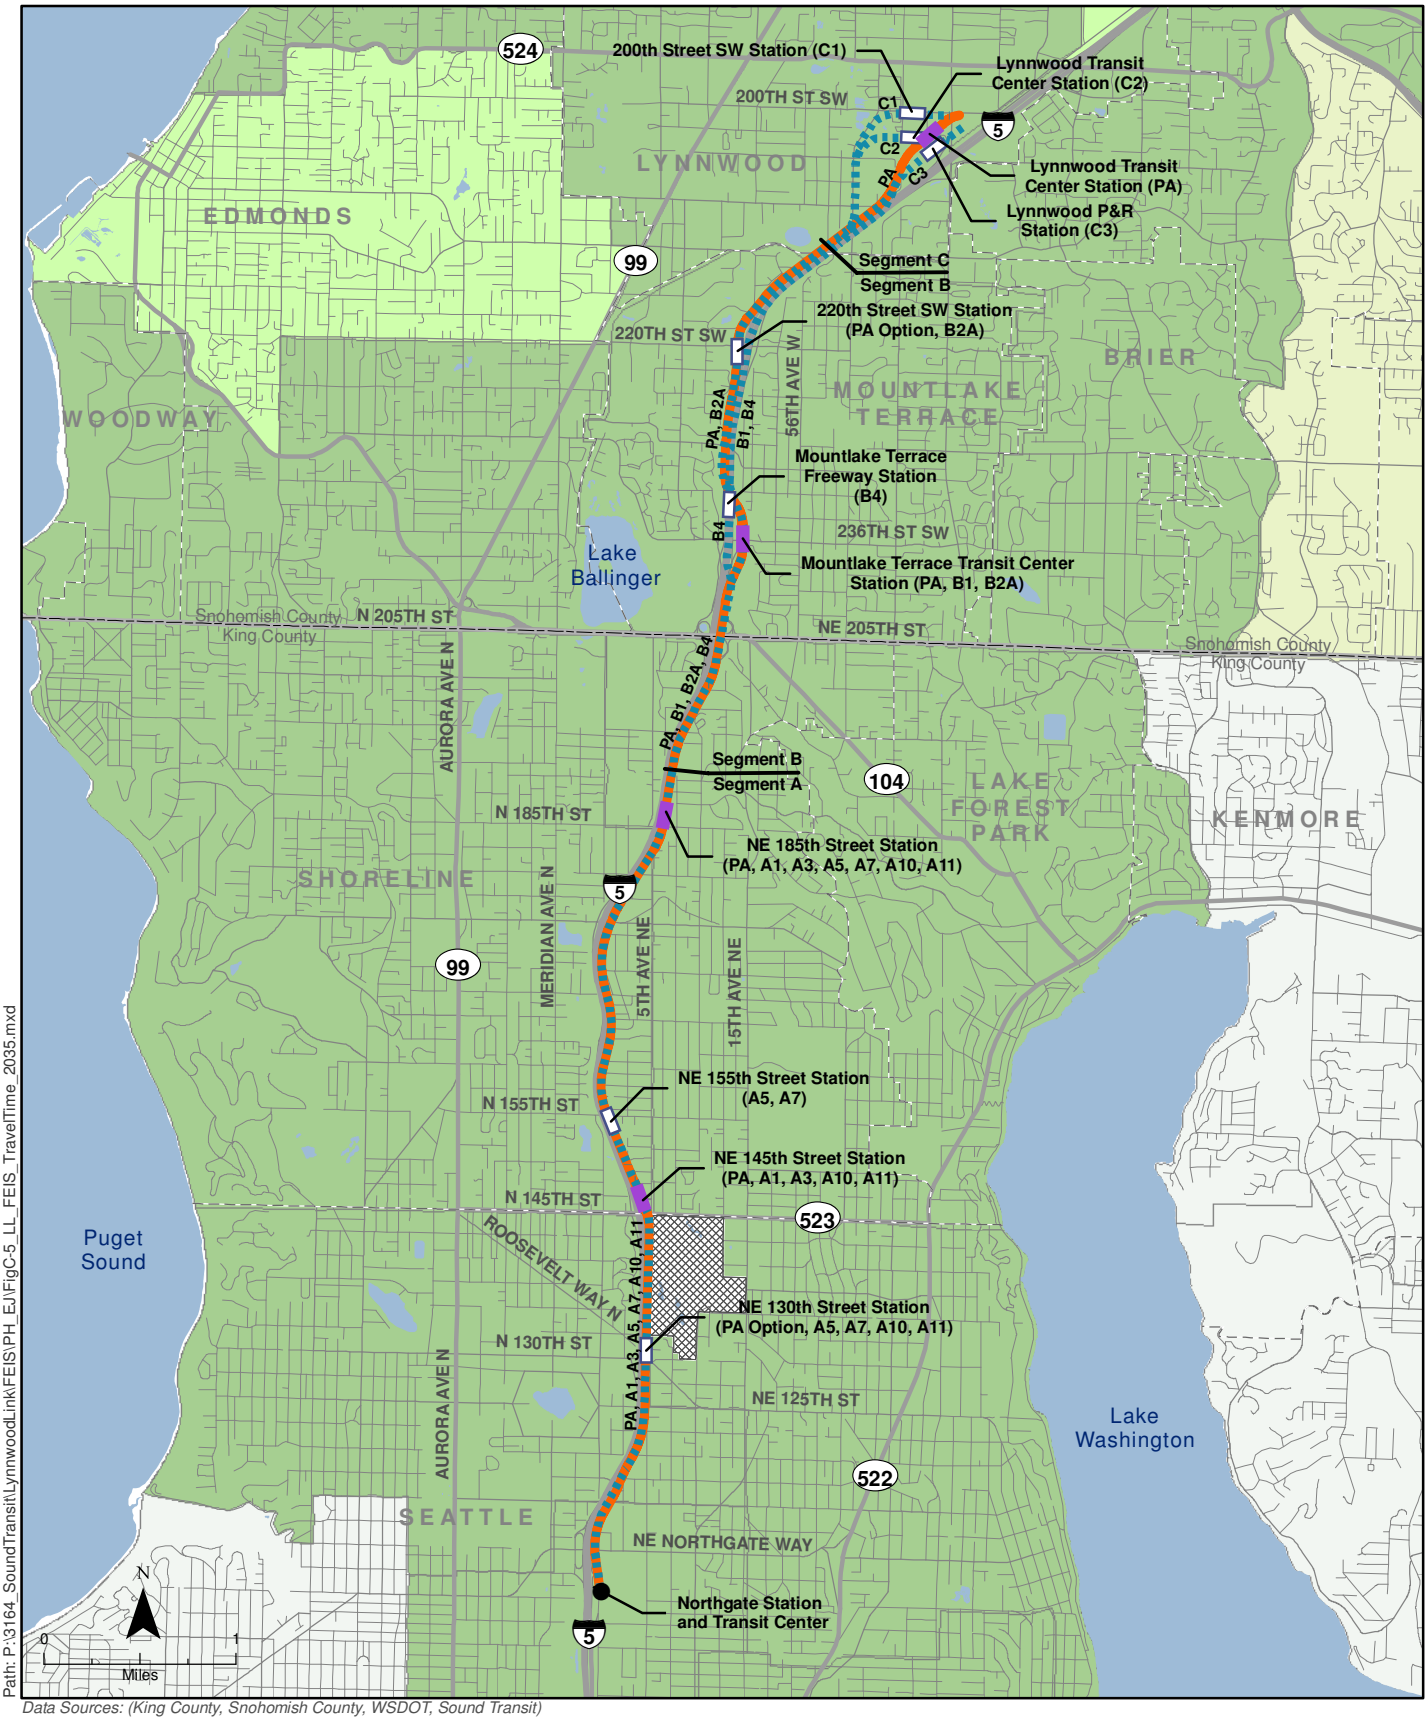

Figure C-5
Travel Time Savings in 2035 for the Preferred Alternative

Lynnwood Link Extension

C.7. CONCLUSIONS

FTA and Sound Transit have assessed the potential for the Lynnwood Link Extension to have disproportionately high and adverse effects on minority and low-income populations, in accordance with Executive Order 12898 and USDOT Order 5610.2.

Based on the findings of impacts described in the Final EIS and considering the mitigation measures identified, project impacts would not be high and adverse, and they would not alter the character, functions, or interactions of any of the corridor neighborhoods. Design measures, BMPs, and mitigation commitments would reduce the severity of individual or cumulative impacts on all populations, including minority and low-income populations, to levels that would not be high and adverse. The impacts would not be predominantly borne by, or appreciably more severe for minority and low-income populations. In addition, the project has offsetting benefits to all populations.

The 18 neighborhoods in the study area are diverse. Minority and low-income populations reside all along the corridor. The highest concentrations of these populations are in the South Lynnwood and Lynnwood City Center neighborhoods, both of which have predominantly minority populations (greater than 50 percent).

The primary impacts of the project affecting individuals or businesses would be from property acquisition and displacement, but compensation and relocation assistance in accordance with federal regulations and Sound Transit policies would prevent these impacts from being high and adverse. Sound Transit anticipates some low-income and minority individuals would be affected by residential and business acquisitions, based on demographic information for the corridor communities and as a result of public outreach including meetings with property owners. While property acquisitions and the resulting displacements would be unavoidable, they would be mitigated through Sound Transit's real property acquisition policy, including its compensation and relocation assistance program.

Moreover, the Lynnwood Link Extension would have offsetting benefits. The light rail alternatives would improve access to regional activity centers and employment opportunities. Light rail transit would be more reliable and more frequent, with increased hours of service. These improvements would particularly benefit transit-dependent persons, including those having more than one job, or working swing and graveyard shifts due to extended operating hours of the light rail system compared to the bus transit systems. The light rail extension would reduce air quality criteria pollutants and mobile source air toxic pollutants compared to the No Build Alternative. Ambient noise levels may be reduced, particularly where no noise barriers currently exist or where replacement noise barriers would be constructed. Because of recent planned and proposed changes

in municipal comprehensive and neighborhood plans, proposed stations in Mountlake Terrace, Shoreline, and especially Lynnwood could result in more intensive land uses, economic development, and mixed land uses to support neighborhood livability and sustainability. The project would benefit the same individuals and businesses that are likely to experience the project's adverse effects.

FTA has concluded that Sound Transit's Lynnwood Link Extension would not result in disproportionately high and adverse effects on minority and low-income populations.

APPENDIX C ATTACHMENTS

Attachment C-1. Neighborhood Descriptions

There are 18 neighborhoods adjacent to the Lynnwood Link Extension corridor. With the exception of one neighborhood, the names and boundaries of these neighborhoods are defined by local governments—the Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood. The boundaries of the Hazelwood neighborhood, which is located east of I-5 at the north terminus of the corridor, was defined by Sound Transit, and reflects the neighborhood's common name. The demographic characteristics are based on U.S. Census data for minorities (Census 2010a) and low income (Census 2010b).

Maple Leaf

The Maple Leaf neighborhood is located south of Northgate Way between I-5 and 15th Avenue NE, Lake City Way, and NE 85th Street. The northwestern corner of the neighborhood is dominated by the Northgate Mall and higher density residential development and offices. Single-family residential housing dominates the remainder of the neighborhood. The neighborhood population totals about 9,400, and is less diverse racially and ethnically than most of the corridor neighborhoods with 27.7 percent minority.

North College Park

The North College Park neighborhood is located south of Northgate Way between I-5, Aurora Avenue, and NE 85th Street. The western edge of the neighborhood is highway-oriented commercial development along Aurora Avenue. Higher density townhouse development projects have been constructed as infill replacing older single-family residential development. The eastern portion of the neighborhood is dominated by the North Seattle Community College and the northeastern area encompasses medical office buildings and high-density residential complexes surrounding Northwest Hospital. This neighborhood population is about 6,700. It is 38.3 percent minority with over 18 percent Asian and approximately 6 percent Black, and 17.1 percent of the population are at or below poverty level.

Haller Lake

The Haller Lake neighborhood is located between I-5 and Aurora Avenue and extends from Northgate Way to NE 145th Street. The private Lakeside School campus is located in the northeast corner of the neighborhood. The southern portion is dominated by the Northwest Hospital and the Evergreen-Washelli Cemetery. The remainder of the neighborhood is largely single-family residential. The population is about 8,200 with 38.0 percent minority; approximately 15 percent is Asian, almost 11 percent other races, and over 7 percent Black. Ten percent of the population lives at or below the poverty level.

Pinehurst

The Pinehurst neighborhood is located east of I-5 between NE Northgate Way and NE 145th Street (the Seattle city limits). The Jackson Park Golf Course dominates the northern one-third section of the neighborhood, while the southern edges are commercial developments north of the Northgate Mall that include several higher density residential complexes. In addition, there are several higher density residential complexes on the south side of NE 125th Street west of the neighborhood commercial district. The neighborhood population totals over 7,800 with minorities comprising over 41 percent (17 percent Asian and 9 percent Black). About 14 percent of the population lives at or below the poverty level.

Parkwood

To the west of I-5, the Parkwood neighborhood extends west to Aurora Avenue between NE 145th and NE 160th Streets. Twin Ponds Park and two elementary schools are key neighborhood community facilities. The King County Metro North Base bus maintenance yard is located in the northeast corner of the neighborhood adjacent to I-5. A highway-oriented commercial district extends along Aurora Avenue south of the Aurora Square Shopping Center at NE 155th Street. The central portion of this neighborhood is single-family residential. This small neighborhood has a population of about 3,400 with minorities comprising approximately 39 percent (over 17 percent Asian, 10 percent other races, and almost 10 percent Hispanic). About 8 percent of the population lives at or below the poverty level.

Meridian Park

The Meridian Park neighborhood west of I-5 extends from NE 165th Street north to NE 185th Street and west to Aurora Avenue. The neighborhood contains several neighborhood parks as well as highway-oriented commercial development along Aurora Avenue. The City of Shoreline has just completed a major streetscape project along this portion of Aurora Avenue. The Shoreline School District Room Nine Community School and the Meridian Elementary School are centrally located in the neighborhood. The population is about 5,400 with over 38 percent minority (over 19 percent Asian and 7 percent Black), and 7 percent at or below poverty level.

Ridgecrest

The Ridgecrest neighborhood extends east of I-5 from NE 145th to NE 175th Streets and is largely single-family residential in character. The Shoreline Fire Station No. 65 is at NE 155th Street just east of I-5. The Ridgecrest Elementary School is located on NE 165th Street. The NE 175th Street corridor is a major arterial with several churches and a library. The neighborhood commercial district is at the

intersection of NE 175th Street and 15th Avenue NE. The population is about 6,400, over 36 percent minority, including 17 percent Asian. About 15 percent of the neighborhood population is at or below poverty level.

North City

The North City neighborhood east of I-5 is bounded by NE 175th and NE 195th Streets. The neighborhood is primarily single-family residential. A neighborhood commercial district is located on 15th Avenue NE between NE 175th and NE 185th Streets. The North City Park and a closed elementary school are located in the northwesterly corner of the neighborhood, immediately east of I-5. The closed school is occupied by two preschools. The neighborhood is less diverse than other neighborhoods with less than 34 percent minority. Asians comprise about 15.5 percent of the approximate 6,400 residents. The population living in poverty is about 9 percent.

Echo Lake

The Echo Lake neighborhood on the west side of I-5 extends from NE 185th Street north to the county boundary at NE 205th Street. This major arterial is SR 104 and connects Lake Forest Park, Ballinger Way, I-5, and Edmonds. The western edge of the neighborhood is characterized by highway-oriented commercial development along Aurora Avenue. The southeast corner of the intersection of Aurora Avenue and SR 104 is the Aurora Village and Costco shopping center. The Shoreline Conference Center, Shoreline School District athletic fields, and the Shoreline Pool are located in the southeastern corner of the neighborhood off NE 185th Street. Most of the north-central portion of the neighborhood is dominated by two large residential subdivision developments and the Holyrood Cemetery. The population is about 5,800 with total minorities comprising 36.9 percent—largely Asian at over 20 percent, and 9.5 percent of the neighborhood population is at or below the poverty level.

Ballinger

Located east of I-5 and straddling SR 104 (Ballinger Way) is the Ballinger neighborhood, which extends from NE 195th to NE 205th Streets. This neighborhood encompasses the I-5/SR 104 interchange where there is considerable commercial and office development east of the interchange. Some multifamily residential developments are north of this commercial district. Farther east, Ballinger Way divides single-family residential development. With a population of just over 3,000 and 37.7 percent minority, the Ballinger neighborhood is diverse with over 9 percent Black and over 13 percent Asian. The population living in poverty is about 9 percent.

Lake Ballinger

The Lake Ballinger neighborhood encompasses Lake Ballinger and is located west of I-5. The Lake Ballinger Golf Course, Lake Ballinger Park, and Nile Temple Country Club and Golf Course are northeast of the lake. Highway-oriented commercial development characterizes the western edge of the neighborhood along Aurora Avenue. North of 220th Street SW, the neighborhood is mixed higher density housing with small pockets of single-family residences. This neighborhood is the second least populated neighborhood with a total population of about 2,100. It is less diverse than other corridor neighborhoods with more than 78 percent White and total minorities (race and ethnicity) comprising less than 26 percent of the population. More than 15 percent of the population lives in poverty.

Gateway

The Gateway neighborhood on the east side of I-5 extends between 212th and 236th Streets SW. Except for the commercial and office development in the immediate proximity of the I-5/244th Street SW interchange, the neighborhood is characterized by single-family residential development with several small parks. With a population of about 3,000, the neighborhood is racially diverse with 35.0 percent minority, including more than 12 percent Hispanic. About 4 percent of the neighborhood population lives in poverty.

Town Center

The Town Center neighborhood is bounded by 236th and 220th Streets SW east of I-5. Key community facilities in the neighborhood include the Terrace Creek Park and Mountlake Terrace Public Library. The City's civic center, fire and police stations, and library are adjacent to the Veterans Memorial Park and northeast of the existing Mountlake Terrace Transit Center. The Mountlake Terrace Recreation Pavilion and Evergreen Playfield Complex are in the center of the neighborhood. The Terrace Park School and Jack Long Park are located in the northwest portion of the neighborhood immediately east of I-5 and surrounded by single-family residences. With a population of about 3,500, this neighborhood is about 29 percent minority, including 10 percent Hispanic. About 4 percent of the population lives at or below the poverty level.

Melody Hill

The Melody Hill neighborhood is west of I-5 between 226th and 212th Streets SW. The western portion of the neighborhood is dominated by commercial and office development, particularly the large Premera Blue Cross office complex. A small single-family residential area is located immediately south of Halls Lake. Another commercial development is located immediately west of I-5 between 226th and

220th Streets SW. With a total population of about 2,300 with approximately 42 percent minority, the neighborhood is diverse with about 18 percent Hispanic. The population living in poverty exceeds 15 percent.

Cascade View

East of I-5, the Cascade View neighborhood extends from 220th to 212th Streets SW and is largely medium-density multifamily residential in character. The southeast corner of the neighborhood is anchored by the Mountlake Terrace High School. Mountain View Villa in the eastern portion of the neighborhood is a manufactured home community. This neighborhood has a total population of almost 4,800 that is diverse (37.9 percent minority) comprising Asian (more than 15 percent) and Hispanic populations (almost 10 percent). About 9 percent of the population lives at or below the poverty level.

Hazelwood

The Hazelwood neighborhood encompasses portions of incorporated Lynnwood and unincorporated Snohomish County west of I-5 between 212th and 196th Streets SW. The Hazelwood Elementary School is centrally located within the neighborhood. A highway-oriented commercial development is in the southeast quadrant of the 44th Avenue West intersection and single-family residences are west of the arterial. A shopping center is in the northeast quadrant of the neighborhood at the intersection of 44th Avenue West and 212th Street SW. The 28th Avenue West intersection is characterized by highway commercial development (e.g., Lowes, Whole Foods, and two hotels). The population of this neighborhood is 3,700 with over 38 percent minority including approximately 22 percent Asian and 6.6 percent Hispanic. Less than 7 percent of the population lives at or below the poverty level.

South Lynnwood

The South Lynnwood neighborhood extends from 212th Street SW at the Lynnwood city boundary north to 196th Street SW between Aurora Avenue and 52nd Avenue West. Scriber Lake and park are located in the northwest corner of the neighborhood. Substantial highway-oriented commercial development and offices are located along this portion of Aurora Avenue as well as the north side of 212th Street SW. In addition, light industrial and multifamily residential complexes are found in this area. There are a few sizable undeveloped parcels in the neighborhood and several mobile home or manufactured housing communities. The neighborhood has a large Group Health medical clinic. Non-residential development is located west of I-5. The neighborhood population is almost 5,500 with over 51 percent minority (about 15 percent Asian, over 7 percent Black, and almost 24 percent Hispanic). About 19 percent of the population lives at or below the poverty level.

Lynnwood City Center

The Lynnwood Transit Center is located in the very southern portion of the Lynnwood City Center neighborhood, which extends from I-5 north to 192nd Street SW and east of 52nd Avenue West. Except for a small area of higher density multifamily residential development immediately north and west of the Lynnwood Transit Center, the remainder of the neighborhood is largely commercial. Uses include restaurants, big box retail stores, hotels, and banks. The Lynnwood Convention Center is located in the northwest corner of the neighborhood. Other major uses include several medical centers, the Lynnwood municipal court, the City's police department offices, and several churches. Alderwood Mall is located several blocks north of the neighborhood boundary. With many non-residential land uses, the population of this neighborhood is the smallest of any of the corridor neighborhoods at only 1,600, though it is very diverse with the minority populations comprising over 58 percent, including 22.6 percent mixed races and 30 percent Hispanic. The percentage of the population at or below the poverty level is 18 percent.

Re: Lynnwood Link Extension Project
Request for Agreement with Determination of Temporary Occupancy

Dear Mr. Krauss:

As part of the Lynnwood Link Extension Environmental Impact Statement (EIS) documentation process, the Federal Transit Administration (FTA), as the lead federal agency, is finalizing the Section 4(f) evaluation of the potential impacts of the project on public parks and recreational facilities, including the Interurban Trail and the Scriber Creek Trail, both in the City of Lynnwood. Based on our review, we believe these are significant recreational resources for purposes of Section 4(f).

Under Section 4(f) of the U.S. Department of Transportation Act of 1966, FTA cannot approve a transportation project such as Lynnwood Link Extension that requires the use of publicly-owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless it determines that there is no "feasible and prudent avoidance alternative"[1] to the use of land from the property; and that the action includes "all possible planning" to minimize harm to the property resulting from such use.

Please note that the project's elevated guideway would cross above the trails. This would require air rights, but no physical property would be acquired. For purposes of Section 4(f), FTA distinguishes the need for air rights from the acquisition of land, so that there is no use as long as the aerial structure does not substantially impair the utility of the trail.

However, the law exempts temporary occupancies of land that are so minimal as to not constitute a use. In order to qualify as a temporary occupancy, the following conditions must be satisfied (23 CFR 774.13(d)):

[1] Definitions are found at 23 CFR § 774.17

- The duration of the use must be less than the time needed for construction of the project, and there should be no change in the ownership of the land;
- Both the nature and magnitude of the changes to the Section 4(f) property must be minimal;
- There must be no anticipated permanent adverse physical impacts, nor interference with the protected activities, features, or attributes of the property on either a temporary or permanent basis; and
- The land being used must be fully restored.

Federal guidance encourages early coordination with officials with jurisdiction over the Section 4(f) resource. Before publishing the Draft EIS, Sound Transit and FTA consulted with the City regarding the potential impacts to the trails and possible mitigation of these impacts.

The table below summarizes the Lynnwood Link project's anticipated impacts on the trails as well as Sound Transit's proposed mitigation.

Evaluation of Project's Use of Lynnwood Trails

Resource	Relevant Alternatives	Impacts on Resource	Mitigation Measures/ Enhancement	4(f) Impacts After Mitigation
Interurban Trail	Preferred Alternative	Construction: temporary trail closure of 6 to 12 months.	Detours with public information and signage directing users to detours; restoration of affected areas after construction	Temporary occupancy
Scriber Creek Trail	Preferred Alternative	Construction: temporary trail closure of 6 to 12 months.	Detours with public information and signage directing users to detours; restoration of affected areas after construction	Temporary occupancy

FTA intends to make a finding of temporary occupancy regarding the project's impacts on the two trails, and we are requesting the City's agreement with this finding.

Federal regulations stipulate that officials with jurisdiction over the Section 4(f) resource must document their agreement with a temporary occupancy finding (23 CFR 774.13(d)(5)). We ask that you sign and return this letter, or your own letter in its place, to confirm the City's concurrence with the temporary occupancy determination based on the four criteria and its

agreement with the potential mitigation. Your letter of concurrence, along with FTA's complete Section 4(f) analysis, will be included in the project's Final EIS.

As the project is further refined during final design, Sound Transit will continue to coordinate with the City regarding detour plans and the restoration of the affected areas.

If you have any questions, please contact Dan Drais (Daniel.Drais@dot.gov; (206) 220-4465).

Sincerely,

for Rick Krochalis, Administrator
Region 10

Re: Lynnwood Link Extension Project
Request for Concurrence with Determination of *De Minimis* Use

Dear Mr. Deal:

As part of the Lynnwood Link Extension Environmental Impact Statement (EIS) documentation process, the Federal Transit Administration (FTA), as the lead federal agency, is finalizing the Section 4(f) evaluation of the potential impacts of the project on public parks and recreational facilities, which includes Ridgecrest Park in the City of Shoreline (Exhibit 1). We understand that the City has determined this to be a significant park.

Under Section 4(f) of the U.S. Department of Transportation Act of 1966, FTA cannot approve a transportation project such as Lynnwood Link Extension that requires the use of publicly-owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless it determines that:

- There is no "feasible and prudent avoidance alternative"[1] to the use of land from the property; and
- The action includes "all possible planning" to minimize harm to the property resulting from such use; or
- The Administration determines that the use of the property, including any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures), will have a *de minimis* impact. A *de minimis* impact is one that will not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f).

Federal guidance encourages early coordination with officials with jurisdiction over the Section 4(f) resource. Before publishing the Draft EIS, Sound Transit and FTA consulted with the City

[1] Definitions are found at 23 CFR § 774.17

of Shoreline regarding the potential impacts to Ridgecrest Park and possible mitigation of these impacts. In March 2013, the City signed a letter indicating its preliminary concurrence with a *de minimis* determination.

Federal regulations stipulate that "officials with jurisdiction over the Section 4(f) resource must concur in writing" with a *de minimis* finding (23 CFR 774.5(2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. The distribution of the Draft EIS for review and comment by the public, agencies, and organizations has satisfied this requirement.

With the comment period on these documents completed, and based on the City's 2013 letter, FTA intends to make a *de minimis* finding on Ridgecrest Park, and we are requesting the City's final concurrence with this finding. Its letter of concurrence will be included in the project's Final EIS. FTA's final Section 4(f) determination will also be included in the Final EIS.

The table below summarizes the Lynnwood Link project's anticipated impacts on Ridgecrest Park and Sound Transit's proposed mitigation.

City of Shoreline Determination of Section 4(f) Use of Ridgecrest Park

Purpose of Park	Relevant Alternatives	Impacts on Resource	Mitigation Measures/ Enhancement	4(f) Impacts After Mitigation
Sporting events/active recreation	Preferred Alternative; all segment A alternatives	Operational: Use of about 0.3 acres at western edge, removing berm and trees; additional visual impacts. Construction: potential temporary construction easement of area along proposed right of way.	Landscaping/ restoration of affected area; barrier installed between light rail and park to function like existing berm in buffering I-5 noise and views of I-5; design and rebuilding of 1st Avenue from NE 159th to NE 161st Street, in coordination with the City; transfer of replacement property at the south end of the park, or other property as agreed to with the City, consistent with the requirements of Forward Thrust, and developed to a level comparable to displaced park area; and outreach in adjacent neighborhood to inform roadway and park design, in coordination with the City.	*de minimis*

As Sound Transit has discussed with the City, the project would rebuild 1st Avenue NE from NE 159th Street to NE 161st Street. This area would be City right-of-way and is not included in the

calculations to replace the acquired park property. The remainder of the impacted non-park parcels after roadway construction (parcels 770, 775, and 776) constitutes the currently proposed replacement area for the acquired property in Ridgecrest Park, assuming that complies with Forward Thrust requirements. Per the City's email dated June 10, 2014 and verification with King County Department of Natural Resources, parcel 764 is not owned by the City of Shoreline or King County, is not a park property, and does not require replacement.

Sound Transit will continue to work with King County to prepare the land conversion process and to ensure that the requirements of Forward Thrust are met.

We ask that the appropriate City official sign and return this letter, or your own letter in its place, to confirm the City's concurrence with the Section 4(f) *de minimis* determination and its agreement with the potential mitigation, and also the City's concurrence that the Lynnwood Link Extension will not adversely affect the features, attributes, or activities qualifying the park for protection under Section 4(f).

As the project is further refined during final design, Sound Transit will continue to coordinate with the City of Shoreline to review and finalize design for restoration of the affected area and for the replacement property at the properties currently identified or other property as agreed to by the City.

If you have any questions, please contact Dan Drais (Daniel.Drais@dot.gov; (206) 220-4465).

Sincerely,

for Rick Krochalis, Administrator
Region 10

Re: Lynnwood Link Extension Project
Request for Concurrence with Determination of *De Minimis* Use

Dear Ms. Miller:

As part of the Lynnwood Link Extension Environmental Impact Statement (EIS) documentation process, the Federal Transit Administration (FTA), as the lead federal agency, is finalizing the Section 4(f) evaluation of the potential impacts of the project on public parks and recreational facilities, which includes the Shoreline School District's Shoreline Stadium (Exhibit 1). We understand that the District has determined this to be a significant park.

Under Section 4(f) of the U.S. Department of Transportation Act of 1966, FTA cannot approve a transportation project such as Lynnwood Link Extension that requires the use of publicly-owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless it determines that:

- There is no "feasible and prudent avoidance alternative"[1] to the use of land from the property; and
- The action includes "all possible planning" to minimize harm to the property resulting from such use; or
- The Administration determines that the use of the property, including any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures), will have a *de minimis* impact. A *de minimis* impact is one that will not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f).

Federal guidance encourages early coordination with officials with jurisdiction over the Section 4(f) resource. Before publishing the Draft EIS, Sound Transit and FTA consulted with the

[1] Definitions are found at 23 CFR § 774.17

District regarding the potential impacts to the stadium property and possible mitigation of these impacts. In March 2013, the District signed a letter indicating its preliminary concurrence with a *de minimis* determination.

Federal regulations stipulate that "officials with jurisdiction over the Section 4(f) resource must concur in writing" with a *de minimis* finding (23 CFR 774.5(2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. The distribution of the Draft EIS for review and comment by the public, agencies, and organizations has satisfied this requirement.

With the comment period on these documents completed, and based on the District's 2013 letter, FTA intends to make a *de minimis* finding on Shoreline Stadium, and we are requesting the District's final concurrence with this finding. Its letter of concurrence will be included in the project's Final EIS. FTA's final Section 4(f) determination will also be included in the Final EIS.

The table below summarizes the Lynnwood Link project's anticipated impacts on Shoreline Stadium and Sound Transit's proposed mitigation.

Shoreline School District's Determination of Section 4(f) Use of Shoreline Stadium

Purpose of Recreational Resource	Relevant Alternatives	Impacts on Resource	Mitigation Measures/ Enhancement	4(f) Impacts After Mitigation
Sporting events/active recreation	**Preferred Alternative;** Alternative A1	Operational: Relocated road would require use of about 0.2 acres of parking lot and stadium area on east side of property. No impact to use of stadium facility. Construction: Potential additional temporary parking reduction, visual and noise impacts.	Restoration of area after construction and facility access improvements to be defined in coordination with Shoreline Public Schools during final design.	*de minimis*

We ask that the appropriate District official sign and return this letter, or your own letter in its place, to confirm the District's concurrence with the Section 4(f) *de minimis* determination and its agreement with the potential mitigation, and also the District's concurrence that the Lynnwood Link Extension will not adversely affect the features, attributes, or activities qualifying the Stadium for protection under Section 4(f).

As the project is further refined during final design, Sound Transit will continue to coordinate with the Shoreline School District s regarding restoration of the affected area and finalize the design of the parking area and access to the Stadium.

If you have any questions, please contact Dan Drais (Daniel.Drais@dot.gov; (206) 220-4465).

Sincerely,

for Rick Krochalis, Administrator
Region 10

ACKNOWLEDGING CONCURRENCE

MAR 05 2013
Deputy Superintendent

February 22, 2013

Marla Miller, Deputy Superintendent
Shoreline Public Schools
18560 1st Ave NE
Shoreline, WA 98155

Dear Ms. Miller:

As part of the Lynnwood Link Extension Draft Environmental Impact Statement (DEIS) documentation process, Sound Transit and the Federal Transit Administration (FTA), as the lead federal agency, are evaluating the potential impacts of the project on public parks and recreational facilities. Sound Transit is working with the FTA to prepare a draft Section 4(f) Evaluation that describes the impacts of the project on these facilities. The draft Section 4(f) Evaluation will be included in the DEIS and is expected to be distributed to the public and agencies for comment in the spring of 2013.

The U.S. Department of Transportation Act of 1966 requires a Section 4(f) Evaluation. Under the Act, FTA cannot approve a transportation project such as Lynnwood Link Extension that requires the use of publicly-owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless a determination is made that:

- There is no feasible and prudent avoidance alternative, as defined in § 774.17, to the use of land from the property; and
- The action includes all possible planning, as defined in § 774.17, to minimize harm to the property resulting from such use; or
- The Administration determines that the use of the property, including any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures), will have a *de minimis* impact. A *de minimis* impact (23 CFR 774.17) is one that will not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f).

Federal guidance encourages early coordination with officials with jurisdiction of the Section 4(f) resource to ascertain the position of the officials to obtain their preliminary views. The intent of our letter is to continue that early coordination and confirm previous discussions between Sound Transit and Shoreline Public Schools staff regarding the project's potential impacts to parks and recreation resources. Throughout the EIS process and project design, should Alternative A1 be identified as the preferred alternative, Sound Transit and FTA will continue to consult with the school district to detail specific mitigation plans.

Federal regulations stipulate that "officials with jurisdiction over the Section 4(f) resource must concur in writing" with a *de minimis* finding (23 CFR 774.5(2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. As per 23

CFR 774.5, this requirement will be met with the distribution of the Draft EIS for review and comment by the public, agencies, and organizations. FTA will request final concurrence in writing by Shoreline Public Schools on the *de minimis* finding following the comment period for the Draft EIS. At that time, it is anticipated that Shoreline Public Schools will provide final concurrence on *de minimis* determinations for Lynnwood Link Extension. Following the Shoreline Public School's written concurrence, FTA will make final Section 4(f) and *de minimis* determinations, and the Final EIS will include documentation of the Shoreline Public School's concurrence and FTA's determination.

The table below lists Shoreline Park and Stadium as a Shoreline Public School park facility that the Lynnwood Link Extension project would impact. Based on Sound Transit's review, this park resource is considered significant for purposes of Section 4(f). Given the potential project impacts and the proposed potential mitigation, Sound Transit believes that a preliminary *de minimis* determination can be made for Shoreline Park and Stadium.

Shoreline Public Schools Facility and Preliminary Determination of Section 4(f) Use

Resource	Purpose of Resource	Project Alternative	Impact on Resource	Potential Mitigation	Preliminary 4(f) Findings after Mitigation
Shoreline Park and Stadium	Sporting events/active recreation	A1	Operations: Relocated local road would require use of 0.18 acre of stadium area and parking lot on east side of property. Reduced parking, no impact to use of stadium facility. Construction: Potential additional temporary parking reduction, visual and noise impacts.	Restoration of area after construction and facility access improvements to be defined.	*de minimis*

We ask that you provide your signature on this letter to confirm:

- Shoreline Public Schools agrees Shoreline Park and Stadium is a significant park and recreation resource; and
- Shoreline Public Schools does not object to considering a potential Section 4(f) *de minimis* finding for Shoreline Park and Stadium, and Shoreline Public Schools may provide a letter of concurrence with a *de minimis* finding after further public review and discussion of the Draft EIS and Draft Section 4(f) evaluation, and with general agreement upon appropriate mitigation measures.

This letter will assist Sound Transit as the project progresses toward a preferred alternative that would avoid a Section 4(f) use. Sound Transit acknowledges that a formal concurrence from the Shoreline Public Schools will require further discussions with Shoreline Public Schools staff.

Sincerely,

Steve Kennedy

Dick Deal, Director
Parks, Recreation and Cultural Services Department
City of Shoreline
17500 Midvale Ave N
Shoreline, WA 98133

Dear Mr. Deal:

As part of the Lynnwood Link Extension Draft Environmental Impact Statement (DEIS) documentation process, Sound Transit and the Federal Transit Administration (FTA), as the lead federal agency, are evaluating the potential impacts of the project on public parks and recreational facilities. Sound Transit is working with the FTA to prepare a draft Section 4(f) Evaluation that describes the impacts of the project on these facilities. The draft Section 4(f) Evaluation will be included in the DEIS and is expected to be distributed to the public and agencies for comment in the spring of 2013.

The U.S. Department of Transportation Act of 1966 requires a Section 4(f) Evaluation. Under the Act, FTA cannot approve a transportation project such as Lynnwood Link Extension that requires the use of publicly-owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless a determination is made that:

- There is no feasible and prudent avoidance alternative, as defined in § 774.17, to the use of land from the property; and
- The action includes all possible planning, as defined in § 774.17, to minimize harm to the property resulting from such use; or
- The Administration determines that the use of the property, including any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures), will have a *de minimis* impact. A *de minimis* impact (23 CFR 774.17) is one that will not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f).

Federal guidance encourages early coordination with officials with jurisdiction of the Section 4(f) resource to ascertain the position of the officials to obtain their preliminary views. The intent of our letter is to continue that early coordination and confirm previous discussions between Sound Transit and City of Shoreline staff regarding the project's potential impacts to parks and recreation resources. Throughout the EIS process and project design, Sound Transit and FTA will continue to consult with the school district to detail specific mitigation plans.

Federal regulations stipulate that "officials with jurisdiction over the Section 4(f) resource must concur in writing" with a *de minimis* finding (23 CFR 774.5(2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. As per 23CFR 774.5, this requirement will be met with the distribution of the Draft EIS for review and comment by the public, agencies, and organizations. FTA will request final concurrence in

writing by the City of Shoreline on the *de minimis* finding following the comment period for the Draft EIS. At that time, it is anticipated that the City will provide final concurrence on *de minimis* determinations for Lynnwood Link Extension. Following the City's written concurrence, FTA will make final Section 4(f) and *de minimis* determinations, and the Final EIS will include documentation of the City's concurrence and FTA's determination.

The table below lists Ridgecrest Park as a City of Shoreline park facility that the Lynnwood Link Extension project would impact. Based on Sound Transit's review, this park resource is considered significant for purposes of Section 4(f). Given the potential project impacts and the proposed potential mitigation, Sound Transit believes that a preliminary *de minimis* determination can be made for Ridgecrest Park.

City of Shoreline Park Facility and Preliminary Determination of Section 4(f) Use

Resource	Purpose of Resource	Project Alternative	Impact on Resource	Potential Mitigation/Enhancement	Preliminary 4(f) Findings after Mitigation
Ridgecrest Park	Sporting events/active recreation	All Segment A Alternatives	Operational: Use of 0.3 acres at western edge, removing berm and trees. Property and visual impacts. Construction: potential temporary construction easement of area along proposed right of way.	Landscaping and restoration of affected area, barrier between light rail and park to maintain functionality of existing berm, replacement property in condition consistent with displaced park area as required by Forward Thrust.	*de minimis*

We ask that you provide your signature on this letter to confirm:

the City agrees Ridgecrest Park is a significant park and recreation resource; and

the City does not object to considering a potential Section 4(f) *de minimis* finding for Ridgecrest Park, and the City may provide a letter of concurrence with a *de minimis* finding after further public review and discussion of the Draft EIS and Draft Section 4(f) evaluation, and with general agreement upon appropriate mitigation measures.

This letter will assist Sound Transit as the project progresses toward a preferred alternative that would avoid a Section 4(f) use. Sound Transit acknowledges that a formal concurrence from the City of Shoreline will require further discussions with City staff and the Parks, Recreation and Cultural Services Board.

Appendix H

Other Projects Considered for Cumulative Effects

APPENDIX H – OTHER PROJECTS CONSIDERED FOR CUMULATIVE EFFECTS

The National Environmental Policy Act (NEPA) requires that any agency proposing a major federal action, which may significantly affect the environment, consider the environmental impacts of the proposed action, any unavoidable adverse environmental impacts, and the relationship between local short-term uses and long-term productivity of the environment (42 United States Code [USC] § 4332(c)). As part of analyzing cumulative effects and predicting conditions for the future regional transportation system for the Lynnwood Link Extension project, Sound Transit identified other projects that are "reasonably foreseeable." These projects included planned in the Puget Sound region's federally required Metropolitan Transportation Plan (MTP), Puget Sound Regional Council's (PSRC) Transportation 2040, as well as the funded or committed projects identified in the region's Transportation Improvement Plan and the related PSRC travel demand forecast model.

In addition, the Final Environmental Impact Statement (EIS) for the Lynnwood Link Extension has identified other non-transportation projects and actions that are planned or in development that could alter the level of impacts a resource or an area might experience, compared to the impacts defined for the No Build Alternative or light rail alternatives alone. The projects described below are separate actions undertaken even if the Lynnwood Link Extension project is not developed. Under each environmental topic in the Final EIS, the cumulative effects of the Lynnwood Link Extension are discussed in combination with the projects described here and other past, current, or planned projects.

Transportation Projects

- *Northgate Link Extension Project*—Sound Transit is extending Link light rail to Northgate in north Seattle. This project will connect the Northgate, Roosevelt, and University District neighborhoods to downtown Seattle and the Seattle-Tacoma International Airport. Construction of this project is underway, and will be open for service in 2021. The EIS for this project, North Link Final Supplemental Environmental Impact Statement, was completed in 2006, which also covered the University Link project from downtown Seattle to the University District. (This project and other projects by Sound Transit that were authorized by Sound Transit 2 [ST2] are already assumed under the No Build Alternative and light rail alternatives as part of the light rail system anticipated to be in place when the Lynnwood Link Extension begins operation. While the transportation forecasts already take the Northgate Link Extension into account, it is highlighted here

because it involves construction and operation adjacent to where the Lynnwood Link Extension would start.)

- *SR 520 Bridge Replacement and HOV Program*—A new floating bridge will be constructed across Lake Washington with four general purpose lanes and two inside high-occupancy vehicle (HOV) lanes. A reversible transit/HOV ramp will operate from State Route (SR) 520 to the existing Interstate 5 (I-5) Express Lanes. This ramp facilitates westbound SR 520 HOV lane movements to the southbound I-5 Express Lanes in the AM period, and northbound I-5 Express Lanes movements to the eastbound SR 520 HOV lane in the PM period.
- *I-90 Two-Way Transit and HOV Operations Project*—This project will provide two-way transit and HOV operations on I-90 between Bellevue and Seattle by providing HOV lanes on the outer roadways. It will retain the existing reversible operations on the center roadway, with both lanes operating in the same direction—westbound in the AM period and eastbound in the PM period. Single-occupancy vehicles (SOVs) will only be allowed to use the center roadway between Rainier Avenue in Seattle and Island Crest Way on Mercer Island. The center and outer roadway HOV lanes will likely operate with a 2 + occupants per vehicle restriction.
- *SR 99 Alaskan Way Viaduct Seawall Replacement Program*—This project will build a new SR 99 corridor through downtown Seattle. The project includes boring a 2-mile tunnel beneath Seattle, constructing a mile-long stretch of new highway that connects to the south entrance of the tunnel, and constructing a new Alaskan Way surface street along the waterfront that connects SR 99 to downtown.
- *Lakeview Trail, Mountlake Terrace Transit Center to Interurban Trail* (PSRC TIP#: MOU-19)—This project will construct a combination of bicycle lanes, sidewalks, and a new non-motorized trail from the Interurban Trail at 228th Street SW to the west end of the 236th Street SW bridge over I-5, which is adjacent to Community Transit's Mountlake Terrace Transit Center and Sound Transit's Mountlake Terrace Freeway Station.
- *"Main Street" Reconstruction* (PSRC TIP#: MOU-23)—This project includes improvements to 56th Avenue West (236th Street SW to 230th Street SW) and 236th Street SW (transit center to 56th Avenue West). The project will reconstruct existing roadways to allow two travel lanes, bicycle lanes, and curbside parking.
- *Interurban Trail Improvement Project: Missing Links* (PSRC TIP#: LYN-40)—This project will complete two missing links along the Interurban Trail located between 212th Street SW and 52nd Avenue West by constructing a

continuous 12-foot-wide non-motorized bicycle/pedestrian trail that is separated from traffic.

- *196th Street SW (SR 524) Improvement Project (48th Avenue W to 37th Avenue W)* (PSRC TIP#: LYN-43)—This project would add an additional lane in each direction on 196th Street SW (SR 524) extending between 48th Avenue West to 37th Avenue West. The project will improve 196th Street SW (SR 524) by providing additional multimodal capacity, safety, and aesthetic features for a boulevard appearance. Improvements include installation of business access and transit (BAT) lanes in each direction, a planted center median with left-turn and U-turn movements, new curbs, gutters, 12-foot sidewalks, landscaping, undergrounding of overhead utilities, street lighting, and new traffic signals beginning at 48th Avenue West and extending east to 36th Avenue West.
- *Poplar Way Extension Bridge (Poplar Way/196th Street)*—This project would construct an arterial bridge across I-5 to connect the intersections of Poplar Way and 196th Street SW and 33rd Avenue West/Alderwood Mall Boulevard. Intersection modifications would occur at Alderwood Mall Parkway/Poplar Way, 196th Street SW/Poplar Way, and Alderwood Mall Boulevard/33rd Avenue West. The project would include widening portions of Poplar Way, 196th Street SW, Alderwood Mall Boulevard, and 33rd Avenue West. Major elements of the project include a new 600-foot-long, 6-lane bridge with sidewalks and bicycle lanes on both sides.
- *44th Avenue W, I-5 to 194th Street SW Improvement Project* (upcoming project in Lynnwood)—This project plans to widen the roadway to seven lanes, with eight lanes just south of 196th Street SW, including wider sidewalks and landscape features. The improvements are needed to accommodate future growth envisioned for the Lynnwood City Center and to create an enhanced pedestrian environment with a boulevard appearance.
- *200th Street SW, 64th Avenue W to 40th Avenue W Improvement Project* (upcoming project in Lynnwood)—This project plans to add additional lanes (exact locations have not yet been identified), wider sidewalks, landscape features, and bicycle facilities. The improvements are needed to accommodate future growth envisioned for the Lynnwood City Center and the extension of light rail to the Lynnwood Transit Center by 2023.

Other Development Projects

- *Link Operations and Maintenance Satellite Facility*—A NEPA/SEPA EIS is being prepared by Sound Transit and the Federal Transit Administration (FTA) for this project. See Chapter 2, Section 2.9.1 for details. Appendix R has additional information on the OMSF project. Sound Transit is

proposing this facility to provide operations and maintenance capacity for the expanded light rail fleet called for in the ST2 Plan.

- *King County Transit-Oriented Development at Thornton Place, Northgate*—King County is continuing a longer-range program to leverage transit investments by the County and Sound Transit to encourage further transit-oriented development at Thornton Place in Northgate. While development specifics are not in place at this time, higher density developments are anticipated consistent with City of Seattle plans for the Northgate District and the related population and employment growth assumed for the area.
- *Edmonds School District Melody Hill property, 6205 222nd Street SW, Mountlake Terrace*—This site was recently zoned for higher density use by the City of Mountlake Terrace. The school district site, which is now vacant, is being marketed for redevelopment.
- *Edmonds School District, District Support Site*—The Edmonds School District has adopted plans and completed its SEPA review to develop a support center that would relocate all of the District's existing support functions onto one site. The consolidated functions would include administrative offices, a bus base and vehicle maintenance facilities, facilities maintenance, a district warehouse, and a fuel and wash island (with a below-ground tank). A comprehensive plan amendment and rezone application for portions of the property were approved by the Lynnwood City Council in September 2006. The Lynnwood site alternative for the Link Operations and Maintenance Satellite Facility overlaps with the District's planned development. Both of these potential projects are considered in the cumulative effects analysis for the Lynnwood Link Extension.
- *Kings Gate: 240007 56th Avenue W* (land use approved but on hold in Mountlake Terrace)—This project plans to construct a mixed-use (commercial/residential) development in the Town Center District with 3,475 square feet of commercial space and 46 residential units on a 0.93-acre site. The project includes shared open space, landscaping, vehicle/bicycle parking, and a pedestrian activity area. The existing structures will be demolished.
- *Mountlake Terrace Senior Living Apartments: 5525 244th Street SW* (land use approved in Mountlake Terrace)—This project proposes to develop a 0.86-acre vacant lot with approximately 96 units of affordable, independent senior housing (not state licensed). The proposal also includes bicycle and vehicle parking spaces, pedestrian activity area, shared open space, and landscaping. A request to reduce parking requirements has been approved.

- *Mountlake Terrace Town Center*—This project involves an adopted Town Center Plan that calls for development of new stores, restaurants, offices, and housing in a 68-acre downtown zone. Wider sidewalks, street trees, and a public plaza for community use are part of the mix. See Town Center Plan, amended December 2009, on the City's Web site.
- *Mountlake Terrace Gateway Development*— this project south of 236th Street SW and the Mountlake Terrace Transit Center, is in a district the City of Mountlake Terrace has targeted for higher density development. It would include roadway improvements extending Gateway Boulevard to 236th Street SW, with adjacent developments that include 600 apartment units and about 100,000 square feet of commercial space.
- *City of Lynnwood New City Center Planning*—Adopted in 2005 and amended in 2007, the City of Lynnwood Subarea Plan for the City Center calls for upgrades to the city's transportation network and includes new public spaces and parks, housing, cultural attractions, and pedestrian amenities. Plans and projects associated with the City Center are located on the City Center project Web site: http://www.ci.lynnwood.wa.us/City-Services/Planning-and-Development/City-Center/Plans---Projects.htm.
- *Lynnwood City Center Senior Living Development: 19501 40th Avenue West* (development agreement with City of Lynnwood approved August 12, 2013)—This project proposes to develop 308 residential units in an 8-story building.

APPENDIX I-4.2

Land Use

APPENDIX I-4.2 LAND USE — PLANS, GOALS, AND POLICIES

4.2.1 Introduction

Sound Transit reviewed regional, state, local, and major institution master plans to identify goals and/or policies applicable to the Lynnwood Link Extension to determine the project's land use compatibility and conformance. The following sections summarize the applicable plans, as presented in Table 4.2-1, and discuss the proposed project's consistency with these plans. Tables 4.2-2 through 4.2-19 provide information on specific goals and policies in relevant plans, and the consistency of the Lynnwood Link Extension with each. The tables present the text of the applicable plan element and subsections, identify whether the Lynnwood Link Extension is consistent with the goal or policy, and present a brief discussion on how the project would be consistent with the goal or policy. However, many policies are not listed because they were not relevant to Lynnwood Link Extension.

Table 4.2-1. State, Regional, and Locally Adopted Plans and Policies Evaluated for Consistency

State and Regionally Adopted Plans and Policies
Washington State Growth Management Act (GMA), adopted 1990, as amended
Puget Sound Regional Council's (PSRC) VISION 2040, adopted 2008
PSRC *Transportation 2040*, adopted May 2010, updated May 2014
Sound Transit Regional Transit Long-Range Plan, adopted July 2005 (update in progress)
Sound Transit 2 (ST2), the Regional Transit System Plan for Central Puget Sound, adopted May 2007

City of Lynnwood Mode Split for City Center Street Master Plan, 2009
Lynnwood Local Improvement District (LID) Feasibility Study, 2008

* The City of Shoreline is also preparing a 145th Street Station Subarea Plan, but the study process is behind those associated with the 185th Street Station Subarea Plan. The 145th Street Station Subarea Planned Action Draft EIS is anticipated to be published in January 2015.

4.2.2 State and Regional Plans

From a state and regional perspective, five planning documents establish the framework for local land use:

- Washington State GMA (adopted 1990, as amended)
- PSRC's VISION 2040 (adopted 2008)
- PSRC's *Transportation 2040* (adopted May 2010)
- Sound Transit Regional Transit Long-Range Plan (adopted July 2005)
- Sound Transit 2 (ST2), the Regional Transit System Plan for Central Puget Sound (adopted May 2007)

Washington State Growth Management Act

Plan Summary

The GMA (Revised Code of Washington [RCW] 36.70A), adopted in 1990 to mandate comprehensive planning throughout Washington, provides a comprehensive framework for managing growth and coordinating land use development with the construction of transportation facilities and other infrastructure. Local, county, and regional plans in Washington are required to be consistent with the policies of the GMA. The GMA includes 13 planning goals for

managing urban growth, protecting agricultural lands, reducing sprawl, and encouraging multimodal transportation systems. The overall goals of the GMA encourage development in urban areas where adequate public facilities and services exist or can be provided in an efficient manner. The Act also encourages efficient multimodal transportation systems that are based on regional priorities and are coordinated with county and city comprehensive plans.

Jurisdictions that would be affected by the proposed project, including Seattle, Shoreline, Mountlake Terrace, and Lynnwood, keep pace with land development by making public road and transit improvements to help meet the expected transportation demand. The GMA requires local governments to develop and adopt growth management policies, plans, and regulations. Under the GMA, comprehensive plans must have elements that address land use, housing, capital facilities, utilities, rural lands (counties only), and transportation. In addition, the transportation element is required to be consistent with the land use element. Coordination of land use and transportation is a key component of the GMA. Cities and counties are also mandated by the GMA to establish a process in their comprehensive plans to make the provision for siting essential public facilities, such as airports, state or regional transportation facilities, solid waste handling facilities, mental health facilities, group homes, and secure community transition facilities.

Consistency with Lynnwood Link Extension

The Lynnwood Link Extension is consistent with the GMA in that it would encourage growth within the urban areas, reduce sprawl, and provide a transportation alternative to single-occupancy vehicles. The project's alternatives and stations are located within the cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood, and all have adopted comprehensive plans and regulations consistent with the provisions identified in the GMA. The Lynnwood Link Extension would connect the four cities and their centers of employment and activity and would advance the goals of the GMA.

In addition, the Lynnwood Link Extension is considered an essential public facility and, as such, under GMA, the role of each of the cities (Seattle, Shoreline, Mountlake Terrace, and Lynnwood) is one of collaboration with Sound Transit in the decision-making process. When Sound Transit's routing and station decisions are final, the cities have a "duty to accommodate" the light rail project in their land use plans.

Puget Sound Regional Council VISION 2040

Plan Summary

VISION 2040, adopted in 2008, serves as the region's integrated long-range growth management strategy. It builds from the VISION 2020 plan and expands the focus on sustainability in the incorporation of a projected additional 1.7 million

people in the Puget Sound region by 2040. It promotes the development of a coordinated transportation system that is integrated with and supported by the growth management strategy and builds upon and supports local, countywide, regional, and state planning efforts. Countywide planning policies in each of the counties supply the local framework and provide additional detail for county and city comprehensive plans. VISION 2040's strategies and policies are established within six elements: environment; development patterns; housing; economy; transportation; and public services.

VISION 2040's focus is to contain growth, concentrate new employment in urban centers, and link the centers with a high-quality multimodal transportation system. This strategy is designed to foster a greater mix of land uses and a more complete and efficient network of streets and other public rights-of-way, and to support an urban environment that is more amenable to walking, bicycling, and using transit. VISION 2040 contains many goals and policies that are applicable to the Lynnwood Link Extension.

Consistency with Lynnwood Link Extension

The Lynnwood Link Extension is identified in VISION 2040 and is a key component in linking urban centers. The Preferred Alternative and all other light rail alternatives would support long-range planning and growth management to varying degrees. The Preferred Alternative is generally consistent with regional and local plans and policies in the study area. Some of the other alternatives have alignments or features that are less consistent with some aspects of local policies. However, at the regional level, all alternatives would comply with goals and policies identified in PSRC's VISION 2040 by providing a regional transit system serving a growing transportation need in planned high-density areas, with residential and employment uses within designated urban centers. Also, PSRC's Growing Transit Communities Strategy (2013), which reviewed several of the region's major transit corridors, including the "North Corridor" extending from Lynnwood to Everett, describes regional and local actions to encourage more housing, jobs, and services close to major transit investments.

Table 4.2-2 provides more detailed information on the goals and policies of VISION 2040 and how the Lynnwood Link Extension is consistent with this regional strategy.

Table 4.2-2. Lynnwood Link Extension's Consistency with the Goals and Policies of VISION 2040

Specific Goals and Policies	Discussion
DEVELOPMENT PATTERNS	
Goal: The region will direct growth and development to a limited number of designated regional growth centers. **MPP-DP-5:** Focus a significant share of population and employment growth in designated regional growth centers. **MPP-DP-6:** Provide a regional framework for designing and evaluating regional growth centers. **MPP-DP-7:** Give funding priority—both for transportation infrastructure and for economic development—to support designated regional growth centers. County-level and local funding are also appropriate to prioritize to regional growth centers. **MPP-DP-35:** Develop high quality, compact urban communities throughout the region's urban growth area that impart a sense of place, preserve local character, provide for mixed uses and choices in housing types and encourage walking, bicycling, and transit use.	The Lynnwood Link Extension would support mixed-use (commercial, office, and residential) development to allow growth at greater density where existing land use policies and regulations allow, and provide connections to urban centers with a fast, efficient, and reliable transit system.
Goal: Subregional centers, such as those designated through countywide processes or identified locally, will also play important roles in accommodating planned growth according to the regional vision. These centers will promote pedestrian connections and support transit-oriented uses. **MPP-DP-14:** Preserve and enhance existing neighborhoods and create vibrant, sustainable compact urban communities that provide diverse choices in housing types, a high degree of connectivity in the street network to accommodate walking, bicycling and transit use, and sufficient public spaces. **MPP-DP-17:** Promote transit service to and from existing cities in rural areas.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. The Lynnwood Link Extension would provide fast, reliable, and efficient connections to the other urban centers in the project corridor and to other urban communities as well as regional destinations. Linking the urban centers with fast, reliable, and efficient transit increases the effectiveness of bus transit services to outer areas of the Puget Sound region.
Goal: The region will permanently sustain the ecological functions, resource value, lifestyle, and character of rural lands for future generations by limiting the types and intensities of development in rural areas. **MPP-DP-21:** Contribute to improved ecological functions and more appropriate use of rural lands by minimizing impacts through innovative and environmentally sensitive land use management and development practices. **MPP-DP-22:** Do not allow urban net densities in rural and resource areas.	The Lynnwood Link Extension would support mixed-use (commercial, office, and residential) development to allow greater density where existing land use policies and regulations allow, and provide connections to urban centers with a fast, efficient, and reliable transit system, which would prevent the need for growth in non-urban areas and allow them to be preserved for these preferred values.

Table 4.2-2. Lynnwood Link Extension's Consistency with the Goals and Policies of VISION 2040

Specific Goals and Policies	Discussion
Goal: The region will use design to shape the physical environment in order to create more livable communities, better integrate land use and transportation systems, and improve efforts to restore the environment. **MPP-DP-35:** Develop high quality, compact urban communities throughout the region's urban growth area that impart a sense of place, preserve local character, provide for mixed uses and choices in housing types, and encourage walking, bicycling, and transit use. **MPP-DP-36:** Provide a wide range of building and community types to serve the needs of a diverse population. **MPP-DP-40:** Design transportation projects and other infrastructure to achieve community development objectives and improve communities. **MPP-DP-42:** Recognize and work with linear systems that cross jurisdictional boundaries—including natural systems, continuous land use patterns, and transportation infrastructure systems—in community planning, development, and design.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would provide an alternative to the use of single-occupancy vehicles. It would also provide linkages to other travel modes, including rail, buses, and walking. This would help the overall transportation system operate more efficiently with fewer cars, and provide more walkable and livable communities with affordable transportation options.
TRANSPORTATION	
Goal: As a high priority, the region will maintain, preserve, and operate its existing transportation system in a safe and usable state. (MPP-T-1 through MPP-T-8) **MPP-T-1:** Maintain and operate transportation systems to provide safe, efficient, and reliable movement of people. **MPP-T-3:** Reduce the need for new capital improvements through investments in operations, pricing programs, demand management strategies, and system management activities that improve the efficiency of the current system, goods, and services. **MPP-T-5:** Foster a less polluting system that reduces the negative effects of transportation infrastructure and operation on the climate and natural environment. **MPP-T-6:** Seek the development and implementation of transportation modes and technologies that are energy efficient and improve system performance.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system as an alternative to the use of single-occupancy vehicles and would also provide linkages to other travel modes, including rail, buses, and walking. Lynnwood Link would also provide connections among regional growth centers, which would reduce the need to expand other transportation facilities. Overall, less infrastructure development would be needed with this higher density development. The Lynnwood Link Extension would help reduce air pollution and conserve energy. Most of the stations would be located in areas designated for increased density, and Lynnwood Link Extension would provide direct and frequent access to those areas, as well as provide connections to other regional destinations.
Goal: The future transportation system will support the regional growth strategy by focusing on connecting centers with a highly efficient multimodal transportation network. (MPP-T-9 through MPP-T-22) **MPP-T-9:** Coordinate state, regional, and local planning efforts for transportation through the Puget Sound Regional Council to develop and operate a highly efficient,	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for efficient provision of services and facilities and promoting walkable and cohesive

Table 4.2-2. Lynnwood Link Extension's Consistency with the Goals and Policies of VISION 2040

Specific Goals and Policies	Discussion
multimodal system that supports the regional growth strategy. **MPP-T-10:** Promote coordination among transportation providers and local governments to ensure that joint- and mixed-use developments are designed in a way that improves overall mobility and accessibility to and within such development. **MPP-T-11:** Prioritize investments in transportation facilities and services in the urban growth area that support compact, pedestrian- and transit-oriented densities and development. **MPP-T-12:** Give regional funding priority to transportation improvements that serve regional growth centers and regional manufacturing and industrial centers. **MPP-T-13:** Make transportation investments that improve economic and living conditions so that industries and skilled workers continue to be retained and attracted to the region. **Context and Design** **MPP-T-20:** Design transportation facilities to fit within the context of the built or natural environments in which they are located. **MPP-T-21:** Apply urban design principles in transportation programs and projects for regional growth centers and high capacity transit station areas. **MPP-T-22:** Implement transportation programs and projects in ways that prevent or minimize negative impacts to low income, minority, and special needs populations.	neighborhoods. The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would provide an alternative to the use of single-occupancy vehicles. It would also provide linkages to other travel modes, including rail, buses, and walking. The Lynnwood Link Extension would provide connections among regional growth centers as well as to adjacent communities served by Central Link and East Link light rail.
Goal: The region will invest in transportation systems that offer greater options, mobility, and access in support of the regional growth strategy. **MPP-T-23:** Emphasize transportation investments that provide and encourage alternatives to single-occupancy vehicle travel and increase travel options, especially to and within centers and along corridors connecting centers. **MPP-T-24:** Increase the proportion of trips made by transportation modes that are alternatives to driving alone. **MPP-T-25:** Ensure mobility choices for people with special transportation needs, including persons with disabilities, the elderly, the young, and low-income populations. **MPP-T-26:** Strategically expand capacity and increase efficiency of the transportation system to move goods, services, and people to and within the urban growth area. Focus on investments that produce the greatest net benefits to people and minimize the environmental impacts of	The Lynnwood Link Extension would provide a transportation alternative to single-occupancy vehicles, including for people with special needs. The Lynnwood Link Extension would efficiently move large numbers of people, increase the capacity of existing facilities, and promote more walkable and cohesive neighborhoods. The Lynnwood Link Extension would also provide connections to the other urban centers in the project corridor as well as regional destinations. Completion of the environmental impact statement (EIS) process will enable Sound Transit to preserve right-of-way for the Preferred Alternative for future light rail service.

Table 4.2-2. Lynnwood Link Extension's Consistency with the Goals and Policies of VISION 2040

Specific Goals and Policies	Discussion
transportation. **MPP-T-29:** Promote the preservation of existing rights-of-way for future high-capacity transit.	
ENVIRONMENT	
Goal: The overall quality of the region's air will be better than it is today. **MPP-En-17:** Maintain or do better than existing standards for carbon monoxide, ozone, and particulates. **MPP-En-18:** Reduce levels for air toxics, fine particulates, and greenhouse gases. **MPP-En-19:** Continue efforts to reduce pollutants from transportation activities, including through the use of cleaner fuels and vehicles and increasing alternatives to driving alone, as well as design and land use.	The Lynnwood Link Extension would advance regional policies related to reducing dependence on single-occupancy vehicles and increasing nonmotorized travel modes, especially within urban centers. It would also help reduce air pollution and conserve energy, as discussed in Sections 4.6, Air Quality and Greenhouse Gases, and 4.10, Energy Impacts, of the Final EIS. Most of the stations would be located in areas designated for increased density, and the Lynnwood Link Extension would provide direct and frequent access to those areas, as well as provide connections to regional destinations. Promoting transit and walkable communities would reduce vehicle miles and hours traveled and therefore would help reduce air pollution.
Goal: The region will reduce its overall production of harmful elements that contribute to climate change. **MPP-En-20:** Address the central Puget Sound region's contribution to climate change by, at a minimum, committing to comply with state initiatives and directives regarding climate change and the reduction of greenhouse gases. Jurisdictions and agencies should work to include an analysis of climate change impacts when conducting an environmental review process under the State Environmental Policy Act. **MPP-En-21:** Reduce the rate of energy use per capita, both in building use and in transportation activities. **MPP-En-22:** Pursue the development of energy management technology as part of meeting the region's energy needs. **MPP-En-23:** Reduce greenhouse gases by expanding the use of conservation and alternative energy sources and by reducing vehicle miles traveled by increasing alternatives to driving alone.	See the previous goal and Sections 4.6 and 4.10 of the Final EIS. In addition, the Lynnwood Link Extension would be powered by electricity. In the Puget Sound region and areas that would provide power to the Lynnwood Link Extension, much of the power sources come from hydropower, which is a non-polluting power source. The Lynnwood Link Extension would also reduce greenhouse gases during operation by decreasing vehicle miles and hours traveled. The Lynnwood Link Extension would advance regional policies related to decreasing dependence on single-occupancy vehicles and increasing nonmotorized travel modes, especially within urban centers.

Puget Sound Regional Council's *Transportation 2040*

Plan Summary

Transportation 2040 is the long-range plan for transportation in the central Puget Sound region through 2040 and is the transportation element of VISION 2040. The transportation-related plans of the cities, counties, transit agencies, and the

region form the basis for the *Transportation 2040* plan. The plan looks at the needs of the Central Puget Sound region and identifies what improvements in transportation are needed to meet the anticipated growth. *Transportation 2040* supports a balanced multimodal transportation system that provides options to users and identifies specific projects that have been designed to result in improved roads, transit, and ferry service. To meet recent federal and state mandates, an updated *Transportation 2040* was adopted in May 2014. This minor update reflects changes in the region since the plan was adopted in 2010 and includes completing ongoing work items, meeting statutory obligations, and incorporating planning activities currently underway.

Consistency with Lynnwood Link Extension

The Lynnwood Link Extension is identified in *Transportation 2040* and is a key component in the development of a regional high-capacity transit system linking urban centers. In addition, the Lynnwood Link Extension would allow for jurisdictions to better implement transit- and pedestrian-oriented land use patterns where current zoning allows for such development to occur.

Sound Transit 2005 Regional Transit Long-Range Plan

Plan Summary

The Sound Transit 2005 Regional Transit Long-Range Plan, which was updated in 2005, represents the goals, policies, and strategies for the long-term development of a high-capacity transit system within the Central Puget Sound region. As the Regional Transit Authority (under Chapter 81.104 and 81.112 RCW), Sound Transit is responsible for regional mass transit system planning in the context of *Transportation 2040*. The Sound Transit Long-Range Plan serves as the basis for the next phase of high-capacity transit investments, known as ST2. ST2 builds upon *Sound Move*, the initial implementation phase of the Sound Transit Long-Range Plan, and extends the regional transit network, especially in jurisdictions that are now encouraging increases in land use density in their comprehensive plans and development regulations. The Lynnwood Link Light Rail Transit Project (now the Lynnwood Link Extension) is included in ST2, which was approved by voters in November 2008.

In 2013, Sound Transit initiated an update of its Regional Transit Long-Range Plan to confirm and clarify the long-term vision, make the plan consistent with updated local and regional plans, identify potential modifications to the previously existing plan, and establish Sound Transit's priorities for a future system plan and the next phase of high-capacity transit improvements beyond ST2. An updated plan was adopted by the Sound Transit Board of Directors in December 2014.

Consistency with Lynnwood Link Extension

The Lynnwood Link Extension is an extension of the region's existing light rail system and is consistent with the current Sound Transit Long-Range Plan.

4.2.3 Sound Transit Transit-oriented Development Program

A summary of Sound Transit's transit-oriented development program strategic plan and transit-oriented development policy, as well as a brief discussion of the Lynnwood Link Extension's compatibility and conformance with the strategic plan are presented below.

Sound Transit Transit-oriented Development Strategic Plan and Transit-oriented Development Policy

Plan Summary

Sound Transit's Transit-oriented Development Strategic Plan, which was adopted in September 2011 and updated in April 2014, describes Sound Transit's vision, goals, and strategy for creating transit-oriented development on and around its stations, transit centers, and park-and-ride lots. Transit-oriented development is compact public and private development that supports transit use by emphasizing pedestrian and transit access, such as clustering development and mixing land uses and activities at and around transit facilities. Generally, the purpose of this strategy is to assist in integrating land use and transit in an environmentally responsible way. Specifically, this plan outlines an implementation strategy for Sound Transit's transit-oriented development program, recognizing that interagency, intra-agency, and public collaboration and support are critical factors in the achievement of Sound Transit's transit-oriented development policies. Of particular importance is the transformation of light rail transit station areas into livable transit communities. Recent updates to the plan focus on the role of transit-oriented development in long-range and project planning. Sound Transit's Transit-oriented Development Policy, adopted by the Sound Transit Board in 2012, establishes a framework in which Sound Transit will evaluate, facilitate, and implement transit-oriented development strategies as the agency plans, designs, builds and operates the regional transit system, through cooperation and partnerships with public and private entities, as allowed by applicable laws, regulations, plans, and policies.

Consistency with Lynnwood Link Extension

The Lynnwood Link Extension supports transit-oriented development in local station areas that allow for increased density. Any transit-oriented development occurring in station areas as a result of the Lynnwood Link Extension would follow the implementation strategy for Sound Transit's transit-oriented development program. This strategy is described in the Sound Transit Transit-oriented

Development Program Strategic Plan and Sound Transit Transit-oriented Development Policy.

4.2.4 Local Land Use Plans

The local land use plans and development regulations that are relevant to the Lynnwood Link Extension are summarized below. Each section also provides specific goals and policies as applicable, and briefly discusses the Lynnwood Link Extension's compatibility and conformance with these plans.

City of Seattle Comprehensive Plan

Plan Summary

Seattle's Comprehensive Plan: Toward a Sustainable Seattle, which was first adopted in 1994 and last amended in 2006, was developed to guide how Seattle will accommodate residential and employment growth over the next 20 years. The plan consists of 11 elements that each contain goals and policies for guiding growth in Seattle: Urban Village, Land Use, Transportation, Housing, Capital Facilities, Utilities, Economic Development, Neighborhood Planning, Human Development, Cultural Resources, and Environment. Sound Transit reviewed the elements to identify the applicable goals and policies. The only elements with goals and policies applicable to the proposed project were in the Land Use and Transportation elements.

Consistency with Lynnwood Link Extension

Table 4.2-3 summarizes the relevant Land Use Element and Transportation Element goals and policies of Seattle's Comprehensive Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-3. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Seattle Comprehensive Plan

Specific Goals and Policies	Discussion
LAND USE ELEMENT	
LUG31: Provide flexibility in, or supplement, standard zone provisions to achieve special public purposes where circumstances warrant. Such areas include shoreline areas, airport height districts, historic landmark and special review districts, major institutions, art and cultural districts, areas around high capacity transit stations, and other appropriate locations.	A portion of the proposed NE 130th Street Station area is located within the Northgate Overlay District. This district was identified to support commercial development, protect the residential character of residential neighborhoods, be amenable to pedestrians, and support Northgate as a regional mass transit center. Specific development standards and design guidelines apply to commercial zones within the overlay district. The standards, including street facades, sidewalk design, and parking, are intended to encourage pedestrian use and activity in the area.

Table 4.2-3. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Seattle Comprehensive Plan

Specific Goals and Policies	Discussion
LU178: Promote the integration of high capacity transit stations into the neighborhoods surrounding them and foster development appropriate to significant increases in pedestrian activity and transit ridership. Use overlay districts or other adjustments to zoning to cultivate transit-oriented communities.	Same as Goal LUG31.
TRANSPORTATION ELEMENT	
TG8: Meet the current and future mobility needs of residents, businesses, and visitors with a balanced transportation system. **TG9:** Provide programs and services to promote transit, bicycling, walking, and carpooling to help reduce car use and single-occupancy vehicle trips.	The Lynnwood Link Extension would provide an alternative to single-occupancy vehicle travel; maintain mobility; and provide fast, efficient, and reliable connections to urban centers. It would also encourage increased density and a mixture of land uses, which promote transit use and more walkable communities.
TG14: Increase transit ridership, and thereby reduce use of single-occupancy vehicles to reduce environmental degradation and the societal costs associated with their use.	The Lynnwood Link Extension would provide an alternative means of transportation over single-occupancy vehicles and would improve air quality and conserve energy.
T20: Work with transit providers to provide transit service that is fast, frequent, and reliable between urban centers and urban villages and that is accessible to most of the city's residences and businesses. Pursue strategies that make transit safe, secure, comfortable, and affordable.	The Lynnwood Link Extension would be designed for and maximize safety, as well as provide fast and reliable transit access between urban centers and regional destinations.
T21: Support development of an integrated, regional high capacity transit system that links urban centers within the city and the region.	The Lynnwood Link Extension would connect with the Northgate Link, Central Link, and East Link, thus providing transit links to urban centers and regional destinations.
TG22: Reduce or mitigate air, water, and noise pollution from motor vehicles.	The Lynnwood Link Extension would reduce air, water, and noise pollution from motor vehicles by providing people with another mode of travel over single-occupancy vehicles.
TG24: Actively engage other agencies to assure that regional projects and programs affecting the city are consistent with City plans, policies, and priorities. **T58:** Coordinate with regional, state, and federal agencies, local governments, and transit providers when planning and operating transportation facilities and services in order to promote regional mobility for people and goods and the urban center approach to growth management.	Sound Transit would coordinate and work with the City to make the Lynnwood Link Extension consistent with City plans, policies, and priorities.

City of Seattle Transportation Strategic Plan

Plan Summary

The City of Seattle's Transportation Strategic Plan, first adopted in 1998 and last amended in 2005, is the 20-year functional work plan for the Seattle Department of Transportation (SDOT). The Transportation Strategic Plan describes the actions SDOT will take to accomplish the goals and policies in the Comprehensive Plan over the next 20 years.

Consistency with Lynnwood Link Extension

Because the goals and policies of Seattle's Comprehensive Plan are used in the City's Transportation Strategic Plan, the Lynnwood Link Extension would also be compatible and in conformance with this plan.

Seattle Department of Transportation Northgate Coordinated Transportation Investment Plan

Plan Summary

The Northgate Coordinated Transportation Investment Plan is a blueprint to guide public and private transportation investments through 2030. These investments will make better land use and transportation choices possible, thus helping to transform the Northgate Urban Center and link it to healthy surrounding neighborhoods and the region. The Coordinated Transportation Investment Plan recommends projects to address existing transportation deficiencies and anticipated future needs.

Consistency with Lynnwood Link Extension

Table 4.2-4 summarizes the relevant transportation improvement concepts of the Coordinated Transportation Investment Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these concepts.

Table 4.2-4. Lynnwood Link Extension's Consistency with the Goals and Policies of the Seattle Department of Transportation Northgate Coordinated Transportation Investment Plan

Specific Goals and Policies	Discussion
TRANSPORTATION IMPROVEMENT CONCEPTS	
J-3: Improve transit service with average of 15 minutes frequencies during peak periods and 30 minutes frequencies during off-peak period to other urban villages, such as Bitter Lake and Aurora-Licton Springs.	The Lynnwood Link Extension would have exclusive rights-of-way for trains, thus allowing the system to operate outside of traffic and avoid operating and safety conflicts. This would allow the trains to run the fast and frequent service needed to serve the corridor, with trains as often as 4 minutes during peak times.

Table 4.2-4. Lynnwood Link Extension's Consistency with the Goals and Policies of the Seattle Department of Transportation Northgate Coordinated Transportation Investment Plan

Specific Goals and Policies	Discussion
J-13: Work with Sound Transit and stakeholders to study and implement proactive parking management techniques around the station to prevent use of neighborhood streets for park-and-ride purposes, prior to the opening of the light rail station.	There are a total of 720 on-street and off-street parking spaces within 0.25 mile of the proposed NE 130th Street Station. Sixty percent of the available parking is on-street and 94 percent of all parking is not time-restricted. In neighborhoods where parking is currently not restricted, Sound Transit would work with the applicable jurisdictions to implement preventative strategies (i.e., time limits or neighborhood permit programs), where appropriate.

Seattle Pedestrian Master Plan

Plan Summary

The mission of the Seattle Pedestrian Master Plan, which was adopted in 2009, is to make Seattle the most walkable city in the nation. The plan aims to meet that mission while supporting the vision of the Pedestrian Master Plan Advisory Group through four main goals: safety, equity, vibrancy, and health.

Consistency with Lynnwood Link Extension

Table 4.2-5 summarizes the relevant objectives of the Seattle Pedestrian Master Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these objectives.

Table 4.2-5. Lynnwood Link Extension's Consistency with the Goals and Policies of the Seattle Pedestrian Master Plan

Specific Goals and Policies	Discussion
OBJECTIVE 3: INCREASE PEDESTRIAN SAFETY	
Strategy 3.2: Improve crossing conditions, especially in areas with high pedestrian demand **a.** Develop and maintain short block lengths to maximize pedestrian crossing opportunities. **b.** Provide short and direct pedestrian crossings. **c.** Implement and evaluate enhancement and enforcement programs. **d.** Revise design standards for curb ramps and curb radii. **e.** Encourage transit providers to locate transit stops close to signalized intersections. **f.** Evaluate current signal timing practices and revise, as needed, to balance pedestrian crossing delay and	At the proposed NE 130th Street Station, the sidewalks adjacent to the roadway on the I-5 overpass are narrow and not buffered from traffic. Depending on the guideway configuration, the NE 130th Street overpass may be reconstructed, resulting in better pedestrian access across I-5. Sound Transit has considered pedestrian safety in developing the Lynnwood Link Extension alternatives and will continue to do so throughout project development. Mitigation measures will be considered, as appropriate, for any impacts on pedestrian safety that cannot be avoided. Nonmotorized facilities are discussed in Chapter 3 of the Final EIS.

Table 4.2-5. Lynnwood Link Extension's Consistency with the Goals and Policies of the Seattle Pedestrian Master Plan

Specific Goals and Policies	Discussion
demand with full intersection functionality. **g.** Adopt and install technologies and systems that reduce barriers to walking as well as conflicts between pedestrians and motorists.	
OBJECTIVE 5: CREATE VIBRANT PUBLIC SPACES THAT ENCOURAGE WALKING	
Strategy 5.1: Create an appropriate mix of uses and destinations within neighborhoods. **a.** Use land use and zoning tools to encourage and support pedestrian-friendly growth and development.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project also would help to focus the majority of growth in the NE 130th Street Station area in Seattle where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.

Seattle Bicycle Master Plan

Plan Summary

The Seattle Bicycle Master Plan, which was adopted in 2014, provides a framework for improving the bicycling environment throughout the city. A central focus of the plan is to design and implement bicycle facilities that are as safe and appropriate for riders of all ages and abilities. The plan also provides guidance on how bicycle investments will be prioritized in the future; performance measures to track progress in accomplishing the plan's goals; and other actions the City and its partners can take to support bicycling in the future.

Consistency with Lynnwood Link Extension

Table 4.2-6 summarizes the relevant goals, objectives, and strategies of the Seattle Bicycle Master Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with this plan.

Table 4.2-6. Lynnwood Link Extension's Consistency with the Goals and Policies of the Seattle Bicycle Master Plan

Specific Goals and Policies	Discussion
Goals: Ridership: Increase the amount and mode share of bicycling in Seattle for all trip purposes. Safety: Improve safety for bicycle riders. Connectivity: Create a bicycle network that connects to places that people want to go, and provides for a time-efficient travel option.	The NE 130th Street Station access for bicyclists occurs primarily along arterials, and access to the west of I-5 is limited by the few freeway crossings. NE 130th Street crosses I-5, but the roadway on the overpass is narrow. Depending on the guideway configuration, the NE 130th Street overpass may be reconstructed, resulting in better nonmotorized access across I-5.

Table 4.2-6. Lynnwood Link Extension's Consistency with the Goals and Policies of the Seattle Bicycle Master Plan

Specific Goals and Policies	Discussion
Objective 2: Integrate planning for bicycle facilities with all travel modes and principles for complete streets. **Strategy 4.2:** Implement cycle tracks (protected bicycle lanes) as part of the bicycle network. 4.2.4: Partner with transit agencies during project development and design to implement cycle tracks along transit corridors to allow for a continuous lane for people riding bicycles. **Strategy 4.9:** Coordinate bicycle network implementation with partners. 4.9.3: Coordinate with transit agencies for last-mile bicycle connections. 4.9.5: Coordinate with partners to install staircase runnels on staircases not owned by SDOT that allow bicycle accessibility to various destinations. **Strategy 4.11:** Improve bicycle safety and access at railroad and rail transit crossings and parallel facilities. 4.11.1: Assess all railroad and rail transit crossings that intersect bicycle facilities and install appropriate bicycle-supportive infrastructure. Use signage and pavement markings to facilitate crossings at 90 degrees to the maximum extent feasible. 4.11.2: Assess all railroad and rail transit lines that run parallel with existing bicycle facilities and install signage to facilitate safer travel behavior and enhance parallel bicycle facilities when possible. **Strategy 4.14:** Consider transit mobility improvements that minimize conflicts with people riding bicycles. 4.14.2: Design transit passenger waiting and boarding facilities to minimize conflicts and pinch points with people riding bicycles. 4.14.5: Recognize that Multimodal Corridor development is also a transit access—last mile—strategy. Enhance connections to and end-of-trip facilities at light rail stations, major transit hubs, major bus stops, and park-and-ride lots. **Strategy 5.5:** Provide short- and long-term secure bicycle parking at high-capacity transit stations, transit hubs, and heavily-used bus stops. 5.5.1: Coordinate with transit agencies and large institutions to develop clear, comprehensive, and consistent bicycle parking demand estimation and documentation methodologies. 5.5.2: Support transit agency partners in their efforts to	The Lynnwood Link Extension would support Sound Transit's updated Bicycle Policy (2009) integrating bicycles with regional transit services and facilities where land regulations allow. Basic elements of the policy include providing convenient means to secure bicycles, short- and long-term bicycle parking, and a facility design and layout that accommodate both bicycle and pedestrian movements.

Table 4.2-6. Lynnwood Link Extension's Consistency with the Goals and Policies of the Seattle Bicycle Master Plan

Specific Goals and Policies	Discussion
track quality and quantity of bicycle parking at transit stations. 5.5.3: Partner with local and regional transit agencies and large institutions to coordinate funding, construction, operations and maintenance of long-term secure bicycle parking facilities. Develop a universal on-demand bicycle parking access and fee system, as well as wayfinding, for future secure bicycle parking facilities.	

City of Seattle Transit Master Plan

Plan Summary

The City of Seattle Transit Master Plan, which was updated in April 2012, is a 20-year plan that identifies the types of transit facilities, services, programs, and system features that will be required to meet Seattle's transit needs through 2030. Building from an extensive market analysis, review of future growth patterns, and evaluation of transit needs, the Transit Master Plan identifies capital investment priorities needed to establish a network of high-quality, frequent transit services that meet the travel needs of most Seattle residents and workers. The Transit Master Plan evaluates and recommends preferred transit modes for high-priority corridors and sets a framework for implementing corridor-based transit improvements in close coordination with other modal needs.

Consistency with Lynnwood Link Extension

Table 4.2-7 summarizes the relevant strategies and policies of the City of Seattle Transit Master Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these strategies and policies.

Table 4.2-7. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Seattle Transit Master Plan

Specific Goals and Policies	Discussion
Strategy 1: Destination Accessibility: Coordinate land uses and the transit network **Policy ToN1.1:** Locate transit intensive land uses in urban villages and along priority transit corridors so they can be efficiently served by frequent transit.	The Preferred Alternative has an option considering a potential station at NE 130th Street. The Lynnwood Link Extension would support limited transit-oriented development around the NE 130th Street Station area if that station area is selected for development. The station would increase the walkability of the surrounding area.

Table 4.2-7. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Seattle Transit Master Plan

Specific Goals and Policies	Discussion
Policy ToN1.2: Direct most development within urban villages, urban centers.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in the NE 130th Street Station area (if selected for development) in Seattle where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
Policy ToN1.3: Design transit nodes, stations, and corridors to maximize their value to neighborhoods.	For the entire Lynnwood Link Extension, Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements, and for features such as stations, while also reflecting the character of individual station areas. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.
Strategy 2: Distance: Create a transit-supportive urban structure & street network. **Policy ToN2.1:** Provide a fine-grained pedestrian and bicycle network that connects to transit.	The NE 130th Street Station (if selected for development) would be designed to integrate within a pedestrian-friendly environment and would incorporate context-sensitive design considerations. Designated drop-off areas are planned at proposed station locations, and bicycle racks are planned where appropriate. Signage and wayfinding designs for each travel mode would be developed with input from affected jurisdictions.
Strategy 3: Density: Concentrate and intensify activities near transit. **Policy ToN3.1:** Use zoning to focus the highest densities closest to transit corridors and nodes. **Policy ToN3.2:** Use land near transit nodes and corridors as efficiently as possible. **Policy ToN3.3:** Plan for density that responds to the character of existing development.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas and help focus the majority of growth in the NE 130th Street Station area (if selected for development) in Seattle where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
Policy ToN3.4: Identify opportunity sites for increased densities on the FTN [Frequent Transit Network]. • Work with owners of vacant and likely redevelopment parcels in station areas and priority transit corridors to encourage infill development.	Sound Transit will promote and encourage transit-friendly, transit-oriented development, joint development, and quality public and private projects at and around the NE 130th Street Station (if selected for development) to enhance the community, build transit ridership, and aid economic

Table 4.2-7. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Seattle Transit Master Plan

Specific Goals and Policies	Discussion
• Encourage partnerships with transit agencies to catalyze TOD [transit-oriented development] projects through property acquisition and/or redevelopment. • Ensure public agencies do not hold property where redevelopment is feasible. • Explore the potential of converting existing surface parking lots into future redevelopment sites. • Focus development at the best-connected transit nodes. • Encourage development opportunity at model interchanges and station areas. • Encourage the location of major destinations at the intersection of transit lines. **Strategy 4:** Diversity: Encourage a mix of uses. **Policy ToN4.1:** Mix residential, employment, recreation, and commercial uses in station areas and along the FTN.	development. Sound Transit will also support and work collaboratively with the City of Seattle and the private sector to ensure transit-oriented development around Sound Transit facilities.
Strategy 6: Demand Management: Provide incentives and disincentives. **Policy ToN6.2:** Reduce auto-dependency by providing transit supportive services and programs.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system as an alternative to the single-occupancy vehicle and would also provide links to other travel modes, including rail, buses, and walking.

City of Shoreline Comprehensive Plan

Plan Summary

Shoreline's Comprehensive Plan, which was first adopted in 1998 and updated in December 2012, builds off the 2005 Comprehensive Plan update. The plan was developed to address anticipated population and employment growth and how facilities and services will be maintained or improved to accommodate expected growth. The plan consists of nine comprehensive plan elements that each contains goals and policies for guiding growth in Shoreline: Land Use; Community Design; Housing; Transportation; Economic Development; Natural Environment; Parks, Recreation and Open Space; Capital Facilities; and Utilities. Additionally, the Shoreline Master Program and Subarea Plans are included as appendices to the Comprehensive Plan. Sound Transit reviewed the elements of the plan and relevant appendices to identify the applicable goals and policies. Goals and policies applicable to the proposed project are included in the Land Use, Housing, Transportation, and Economic Development elements.

Consistency with Lynnwood Link Extension

Table 4.2-8 summarizes the relevant goals and policies of Shoreline's Comprehensive Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
FRAMEWORK GOALS	
FG 2: Provide high quality public services, utilities, and infrastructure that accommodate anticipated levels of growth, protect public health and safety, and enhance the quality of life.	The Lynnwood Link Extension would provide mass transit service to the City of Shoreline, generally following I-5, as well as to other urban centers along the project corridor, and adjacent centers associated with the Central Link and Northgate Link Extension projects.
FG 13: Encourage a variety of transportation options that provide better connectivity within Shoreline and throughout the region.	The Lynnwood Link Extension would bring a light rail transit option to Shoreline with potential stations located at NE 145th Street (Preferred Alternative and Alternatives A1, A3, A10), NE 155th Street (Alternatives A5, A7, A11), and NE 185th Street (Preferred Alternative and Alternatives A1, A3, A5, A7, A10, A11). The Lynnwood Link Extension would also connect with the Northgate Link Extension, University Link Extension, and East Link Extension, thus providing transit connections from Shoreline to urban centers and other regional destinations.
FG 14: Designate specific areas for high-density development, especially along major transportation corridors.	The Lynnwood Link Extension would support mixed-use development in designated urban areas and help focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
LAND USE ELEMENT	
Goal LU I: Encourage development that creates a variety of housing, shopping, entertainment, recreation, gathering spaces, employment, and services that are accessible to neighborhoods.	The Lynnwood Link Extension would support mixed-use development in designated regional growth centers and help focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
Goal LU III: Create plans and strategies that implement the City's Vision 2029 and Light Rail Station Area Planning Framework Goals for transit supportive development to occur within a ½ mile radius of future light rail stations.	Same as Goal LU I.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
Goal LU IV: Work with regional providers to develop a system that includes two light rail stations in Shoreline, and connects all areas of the city to high capacity transit using a multi-modal approach.	The Lynnwood Link Extension would include two light rail stations in the City of Shoreline. Segment A alternatives, the Preferred Alternative, and Alternatives A1, A3, A10, and A11 include light rail station options at NE 145th Street and NE 185th Street. Alternatives A5 and A7 include light rail station options at NE 155th Street and NE 185th Street. The Lynnwood Link Extension would provide light rail transit—a fast, reliable, and efficient mode of travel that would provide linkages to other nonmotorized and transit options.
LU 19: The Special Study Area designates future subarea planning or Light Rail Station Areas. The underlying zoning for this designation remains unless it is changed through an amendment to the Comprehensive Plan Land Use Map and Development Code.	The Lynnwood Link Extension would support mixed-use development in designated regional growth centers. The project would also help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
LU 20: Collaborate with regional transit providers to design transit stations and facilities that further the City's vision by employing superior design techniques, such as use of sustainable materials; inclusion of public amenities, open space, and art; and substantial landscaping and retention of significant trees.	Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.
LU 21: Work with Metro Transit, Sound Transit, and Community Transit to develop a transit service plan for the light rail stations. The plan should focus on connecting residents from all neighborhoods in Shoreline to the stations in a reliable, convenient, and efficient manner.	Sound Transit will continue to coordinate with the City of Shoreline and transit agencies to develop a transit service plan for Shoreline's stations.
LU 22: Encourage regional transit providers to work closely with affected neighborhoods in the design of any light rail transit facilities.	Sound Transit will continue to coordinate with the City of Shoreline regarding the Lynnwood Link Extension.
LU 23: Work with neighborhood groups, business owners, regional transit providers, public entities, and other stakeholders to identify and fund additional improvements that can be efficiently constructed in conjunction with light rail and other transit facilities.	Sound Transit has provided extensive opportunities for public involvement throughout the Lynnwood Link Extension planning phase and will continue to do so throughout the entire project.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
LU 24: Maintain and enhance the safety of Shoreline's streets when incorporating light rail, through the use of street design features, materials, street signage, and lane markings that provide clear, unambiguous direction to drivers, pedestrians, and bicyclists.	Sound Transit will design the project to ensure that safe connections would be maintained or integrated into the potential NE 145th Street, NE 155th Street, and NE 185th Street Stations, and in other locations where the project would alter roadways or other features of the transportation network.
LU 25: Evaluate property within a ½ mile radius of a light rail station for multi-family residential choices (R-18 or greater) that support light rail transit service, non-residential uses, non-motorized transportation improvements, and traffic and parking mitigation.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Station locations were chosen for their proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans, and optimum ridership potential.
LU 26: Evaluate property within a ¼ mile radius of a light rail station for multi-family residential housing choices (R-48 or greater) that support light rail transit service, non-residential uses, non-motorized transportation improvements, and traffic and parking mitigation.	Same as LU 25 above.
LU 27: Evaluate property along transportation corridors that connects light rail stations and other commercial nodes in the city, including Town Center, North City, Fircrest, and Ridgecrest for multi-family, mixed-use, and non-residential uses.	Same as LU 25 above.
LU 28: Implement a robust community involvement process that develops tools and plans to create vibrant, livable, and sustainable light rail station areas.	Sound Transit has provided extensive opportunities for public involvement throughout the Lynnwood Link Extension planning phase and will continue public outreach throughout the entire project.
LU 29: Create and apply innovative methods and tools to address land use transitions in order to manage impacts on residents and businesses in a way that respects individual property rights. Develop mechanisms to provide timely information so residents can plan for and respond to changes.	Sound Transit has provided extensive opportunities for public involvement throughout the Lynnwood Link Extension planning phase and will continue public outreach throughout the entire project. In addition, Sound Transit will support and work collaboratively with the City of Shoreline and the private sector to ensure transit-oriented development around Sound Transit facilities.
LU 30: Encourage and solicit the input of stakeholders, including residents; property and business owners; non-motorized transportation advocates; environmental preservation organizations; and transit, affordable housing, and public health agencies.	Sound Transit has provided extensive opportunities for public involvement throughout the Lynnwood Link Extension planning phase and will continue to do so throughout the entire project.
LU 31: Create a strategy in partnership with the adjoining neighborhoods for phasing redevelopment of current land uses to those suited for Transit-Oriented Communities (TOCs), taking into account when the city's development needs and market demands are ready for change.	Sound Transit will support and work collaboratively with the City of Shoreline and the private sector to ensure transit-oriented development around Sound Transit facilities.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
LU 32: Allow and encourage uses in station areas that will foster the creation of communities that are socially, environmentally, and economically sustainable.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project would also help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
LU 33: Regulate design of station areas to serve the greatest number of people traveling to and from Shoreline. Combine appropriate residential densities with a mix of commercial and office uses, and multi-modal transportation facilities.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Station locations were chosen for their proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans, and optimum ridership potential. Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.
LU 34: Pursue market studies to determine the feasibility of developing any of Shoreline's station areas as destinations (example: regional job, shopping, or entertainment centers).	The potential for development related to the Lynnwood Link Extension is analyzed (in the Final EIS) for the potential NE 145th Street, NE 155th Street, and NE 185th Street Station locations.
LU 35: Identify the market and potential for redevelopment of public properties located in station and study areas.	Same as LU 34.
LU 36: Encourage development of station areas as inclusive neighborhoods in Shoreline with connections to other transit systems, commercial nodes, and neighborhoods.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would provide linkages to other travel modes, including rail, buses, bicycling, and walking.
LU 37: Regulate station area design to provide transition from high-density multi-family residential and commercial development to single-family residential development.	Sound Transit will support and work collaboratively with the City of Shoreline and the private sector to ensure transit-oriented development around Sound Transit facilities.
LU 38: Through redevelopment opportunities in station areas, promote restoration of adjacent streams, creeks, and other environmentally sensitive areas; improve public access to these areas; and provide public education about the functions and values of adjacent natural areas.	The Lynnwood Link Extension would provide the opportunity for development around station areas. As development occurs, the City of Shoreline could promote various environmental restoration projects.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
LU 39: Use the investment in light rail as a foundation for other community enhancements.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
LU 40: Explore and promote a reduced dependence upon automobiles by developing transportation alternatives and determining the appropriate number of parking stalls required for TOCs. These alternatives may include ride-sharing or vanpooling, car-sharing (i.e., Zipcar), bicycle sharing, and walking and bicycle safety programs.	The Lynnwood Link Extension would reduce dependency on the automobile by providing a fast, efficient, and reliable mode of travel with linkages to other travel modes, and it would also support development in those areas targeted for growth.
LU 41: Consider a flexible approach in design of parking facilities that serve light rail stations, which could be converted to other uses if demands for parking are reduced over time.	Sound Transit will continue to coordinate with the City of Shoreline regarding parking for the Lynnwood Link Extension that could be converted to other uses as parking demand shrinks.
LU 42: Transit Oriented Communities should include non-motorized corridors, including undeveloped rights-of-way, which are accessible to the public, and provide shortcuts for bicyclists and pedestrians to destinations and transit. These corridors should be connected with the surrounding bicycle and sidewalk networks.	Sound Transit will support and work collaboratively with the City of Shoreline and the private sector to ensure transit-oriented development around Sound Transit facilities.
LU 43: Employ design techniques and effective technologies that deter crime and protect the safety of transit users and neighbors.	Sound Transit implements crime prevention through environmental design principles directed at reducing crime incidents at park-and-ride lots. Other measures to minimize crime would include the use of equipment (i.e., closed circuit TV), the use of anti-crime programs such as anti-graffiti programs, and the use of security personnel.
LU 49: Consider the addition of compatible mixed uses and shared (joint use) parking at park-and-ride facilities.	Sound Transit will continue to coordinate with the City of Shoreline regarding parking for the Lynnwood Link Extension that could be converted to other uses as parking demand shrinks.
LU 50: Work with transit providers to site and develop park and rides with adequate capacity and in close proximity to transit service.	Sound Transit will continue to coordinate with the City of Shoreline regarding parking for the Lynnwood Link Extension.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
LU 52: Parking requirements should be designed for average need, not full capacity. Include regulatory provisions to reduce parking standards, especially for those uses located within ¼ mile of high-capacity transit, or serving a population characterized by low rates of car ownership. Other parking reductions may be based on results of the King County Right-Sized Parking Initiative.	Sound Transit will continue to coordinate with the City of Shoreline regarding parking within ¼ mile of high-capacity transit.
HOUSING ELEMENT	
H 18: Consider mandating an affordability component in Light Rail Station Areas or other Transit-Oriented Communities.	Sound Transit will support and work collaboratively with the City of Shoreline and the private sector to ensure transit-oriented development around Sound Transit facilities.
TRANSPORTATION ELEMENT	
Goal T III. Provide a pedestrian system that is safe, connects destinations, accesses transit, and is accessible by all.	Lynnwood Link Extension stations would be designed to encourage pedestrian and nonmotorized accessibility.
Goal T IV: Work with transportation providers and regional partners to develop and implement an efficient and effective multimodal transportation system to address overall mobility and accessibility, and which maximizes the people-carrying capacity of the surface transportation system.	The Lynnwood Link Extension would provide light rail transit—a fast, reliable, and efficient mode of travel that would provide linkages to other nonmotorized and transit options.
Goal T VI: Encourage alternative modes of transportation to reduce the number of automobiles on the road.	The Lynnwood link Extension would reduce dependency on the automobile by providing a fast, efficient, and reliable mode of travel with linkages to other travel modes.
Goal T VIII: Coordinate the implementation and development of Shoreline's transportation system with our neighboring transit systems and regional partners.	Sound Transit would coordinate and work with the City of Shoreline regarding the Lynnwood Link Extension.
Goal T IX: Support increased transit coverage and service that connects local and regional destinations to improve mobility options for all Shoreline residents.	The Lynnwood Link Extension would provide a fast, reliable, and efficient mode of mass transit linking Shoreline to other urban centers in the project corridor and other urban communities and destinations in the region.
T1: Work with the community and regional partners to create standards for development of the Light Rail Station Special Study Areas identified in the Land Use Map (Figure LU-1) and to implement Light Rail Framework Goals, which became LU20 – LU43.	Sound Transit would coordinate and work with the City of Shoreline regarding the Lynnwood Link Extension.
T3: Reduce the impact of the city's transportation system on the environment through the use of technology, expanded transit use, and non-motorized transportation options.	The Lynnwood Link Extension would provide light rail transit—a fast, reliable, and efficient mode of travel that would provide linkages to other nonmotorized and transit options.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
T28: Encourage development that is supportive of transit, and advocate for expansion and addition of new routes in areas with transit supportive densities and uses.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
T30: Work with transportation providers to develop a safe, efficient, and effective multi-modal transportation system to address overall mobility and accessibility. Maximize the people-carrying capacity of the surface transportation system.	The Lynnwood Link Extension would provide light rail transit—a fast, reliable, and efficient mode of travel that would provide linkages to other nonmotorized and transit options.
T34: Work with Sound Transit, the Shoreline School District, the Washington State Department of Transportation, King County Metro Transit, the City of Seattle, and Shoreline neighborhoods to develop the final light rail alignment and station area plans for the areas surrounding the future Link Light Rail stations. (See LU20 – LU43 for additional light rail station study area policies.)	Sound Transit and the City of Shoreline have been coordinating through the Lynnwood Link Extension planning phase and will continue to coordinate throughout the entire project.
T38: Work with Metro Transit, Sound Transit, and Community Transit to develop a bus service plan that connects residents to light rail stations, high-capacity transit corridors, and park and ride lots throughout the city.	Same as T34 above.
T39: Implement traffic mitigation measures at Light Rail Station Areas.	Transportation impacts of the Lynnwood Link Extension would be mitigated. Please see Chapter 3 of the Final EIS for more information.
T40: Promote livable neighborhoods around the light rail stations through land use patterns, transit service, and transportation access.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods.

Table 4.2-8. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Comprehensive Plan

Specific Goals and Policies	Discussion
Economic Development	
Goal ED I: Maintain and improve the quality of life in the community by: • Increasing employment opportunities and the job base; • Supporting businesses that provide goods and services to local and regional populations; • Reducing reliance on residential property tax to fund City operations and capital improvements; • Providing quality public services; • Complementing community character; and • Maximizing opportunities along Bus Rapid Transit corridors and areas to be served by light rail.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would be an alternative to the single-occupancy vehicle. It would also provide linkages to other travel modes, including rail, buses, and walking. Efficiencies in transportation and more walkable communities are shown to improve people's quality of life.
ED1: Improve economic vitality by: • Promoting existing businesses; • Recruiting new businesses; • Assisting businesses to create strategies and action plans through the Small Business Accelerator Program; • Encouraging increased housing density around commercial districts, especially those served by high capacity rapid transit, to expand customer base; and • Developing design guidelines to enhance commercial areas with pedestrian amenities, and "protect and connect" adjacent residential areas.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods.
ED2: Promote non-motorized connections between commercial businesses, services, and residential neighborhoods.	The Lynnwood Link Extension would bring to the City of Shoreline light rail transit—a fast, reliable, and efficient mode of transportation connecting to other nonmotorized and transit options.
ED31: Plan the Light Rail Station Areas to create connectivity for appropriate growth.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas. The project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for efficient provision of services and facilities.

City of Shoreline Southeast Neighborhoods Subarea Plan

Plan Summary

Shoreline's Southeast Neighborhoods Subarea Plan, which was adopted in 2010, proposes a long-range vision, identifies infrastructure priorities, implements appropriate zoning, and informs development of code modifications for the Briarcrest and Paramount special study areas (located predominantly in the Ridgecrest neighborhood). The plan consists of seven elements that each contain goals and policies for guiding growth in Shoreline's Southeast Neighborhoods: Land Use; Housing; Transportation; Parks, Recreation, and Open Space; Economic Development; Community Design; and Natural Environment. The only elements with goals and policies applicable to the proposed project were in the Land Use and Transportation elements.

Consistency with Lynnwood Link Extension

Table 4.2-9 summarizes the relevant Land Use and Transportation goals and policies of Shoreline's Southeast Neighborhoods Subarea Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-9. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Southeast Neighborhoods Subarea Plan

Specific Goals and Policies	Discussion
LAND USE	
LU4: Establish policies and zoning to provide appropriate transitions between existing and proposed development and dissimilar land uses to minimize conflicts related to solar access, noise, scale, etc.	Sound Transit will support and work collaboratively with the City of Shoreline and the private sector to ensure transit-oriented development around Sound Transit facilities.
LU5: Place highest density housing (mixed-use) on transit lines in already established commercial zones.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
LU9: As the housing market and transportation technologies evolve to support more options, establish zoning designations for areas that may be appropriate for car-free zones or reduced parking standards.	The Lynnwood Link Extension would reduce dependency on the automobile by providing a fast, efficient, and reliable mode of travel with linkages to other transportation modes. Doing this lends support for future car-free zones or reduced parking standards.

Table 4.2-9. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Southeast Neighborhoods Subarea Plan

Specific Goals and Policies	Discussion
LU10: Quality of life for current residents in the subarea should be considered in decision-making processes that involve new development in the community, even though decisions must also take into account overall land use goals and the economic needs of the City as a whole.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would provide an alternative to the single-occupancy vehicle and also provide linkages to other travel modes, including rail, buses, and walking. Efficiencies in transportation and more walkable communities are shown to improve people's quality of life.
TRANSPORTATION	
T2: Retain, improve, and expand public transit	The Lynnwood Link Extension would expand light rail transit as part of a balanced regional transportation system.
T3: Increase local transit service to economic hubs and schools (in addition to service to downtown Seattle) that focuses on east/west connections.	The Lynnwood Link Extension in its connection to Northgate Link Extension and University Link Extension would provide direct transit service to the University of Washington and downtown Seattle as well as regional job centers north to Lynnwood.
T11: Encourage the City to work with Seattle, King County, Sound Transit, and WSDOT to undertake a corridor study on 145th Street that would result in a plan for the corridor to improve safety, efficiency, and modality for all users.	As part of the Lynnwood Link Extension, a potential station could be located at Interstate 5 and NE 145th Street. Sound Transit would coordinate and work with the City of Shoreline on a corridor study on NE 145th Street, as needed, to improve safety, efficiency, and modality for all users.

City of Shoreline Transportation Master Plan

Plan Summary

Shoreline's Transportation Master Plan, which was adopted in 2011, provides policies and goals for development of the City's transportation system based upon growth assumptions through 2030. The Transportation Master Plan focuses on satisfying future travel demand by making efficient use of the existing infrastructure, planning for improvements to the City's transportation network, and providing the facilities and services to encourage walking, bicycling, and transit as priority modes. Included as part of the Transportation Master Plan are the Bicycle Plan, Pedestrian Plan, Transit Plan, and Master Street Plan.

Consistency with Lynnwood Link Extension

Table 4.2-10 summarizes the relevant goals and policies of Shoreline's Transportation Master Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-10. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Transportation Master Plan

Specific Goals and Policies	Discussion
SUSTAINABILITY AND QUALITY OF LIFE	
Goal T II: Work with transportation providers to develop a safe, efficient, and effective multimodal transportation system to address overall mobility and accessibility. Maximize the people-carrying capacity of the surface transportation system.	The Lynnwood Link Extension would provide light rail transit—a fast, reliable, and efficient mode of travel that would provide linkages to other nonmotorized and transit options.
T2: Reduce the impact of the City's transportation system on the environment through the use of technology, expanded transit use and nonmotorized transportation options.	Lynnwood Link Extension would be powered by electricity. In the Puget Sound region and areas serving power to the Lynnwood Link Extension project corridor, much of the power sources come from hydropower, which is a non-polluting power source. The Lynnwood Link Extension would also reduce greenhouse gases during operation by reducing vehicle miles and hours traveled. The Lynnwood Link Extension would further promote regional policies related to reducing dependence on single-occupancy vehicles and increasing nonmotorized travel modes, especially within urban centers.
T10: Transportation projects and facilities should be sited, designed, and constructed to avoid or minimize negative environmental impacts to the extent feasible.	The Lynnwood Link Extension would provide for an improved quality of life by providing a fast, efficient, and reliable mode of travel; encouraging increased densities where allowed; and promoting more walkable and cohesive neighborhoods. The Lynnwood Link Extension includes mitigation and design measures that would minimize impacts on the environment.
10: Encourage the use of programs and services that minimize the need to own a car, such as car sharing and increased transit use.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would provide an alternative to the use of single-occupancy vehicles.
10.10: Encourage the use of technologies that minimize reliance on fossil fuels and reduce greenhouse gas emissions, such as electric and high fuel efficiency automobiles.	The Lynnwood Link Extension would be powered by electricity. In the Puget Sound Region and areas the Lynnwood Link Extension would serve, non-polluting hydropower is a major source of power. The Lynnwood Link Extension would result in a decrease of greenhouse gases during operation by reducing vehicle miles and hours traveled. The Lynnwood Link Extension would further promote regional policies related to reducing dependence on single-occupancy vehicles and increasing nonmotorized travel modes, especially within urban centers.
Goal T IV: Encourage alternative modes of transportation to reduce the number of automobiles on the road.	The Lynnwood link Extension would promote reduced automobile use by introducing a new transit alternative.

Table 4.2-10. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Transportation Master Plan

Specific Goals and Policies	Discussion
T5: Support and promote opportunities and programs so that residents have options to travel throughout Shoreline and the region using modes other than single-occupancy vehicles.	Same as Goal T IV.
Goal T VII: Coordinate the implementation and development of shoreline's transportation system with its neighbors and regional partners.	Sound Transit will continue to coordinate with the City of Shoreline and transit agencies to develop a transit service plan for Shoreline's stations.
BICYCLE PLAN	
Goal T VIII: Develop a bicycle system that is connective, safe and encourages bicycling as a viable alternative method of transportation.	The Lynnwood Link Extension would support Sound Transit's updated Bicycle Policy (2009) to integrate bicycles with regional transit services and facilities where land use regulations allow. Basic elements of the policy include providing convenient means to secure bicycles, short- and long-term bicycle parking, and facility design and layout that accommodate both bicycle and pedestrian movement.
T14: Implement the Bicycle System Plan. Develop a program to construct and maintain bicycle facilities that are safe, connect to destinations, access transit and are easily accessible. Use short-term improvements, such as signage and markings, to identify routes when large capital improvements will not be constructed for several years.	Same as Goal T VIII.
PEDESTRIAN PLAN	
Goal T IX: Provide a pedestrian system that is safe, connects to destinations, accesses transit and is accessible by all.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas. This project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
17.1: Develop wayfinding signage and mapping system for pedestrian facilities that directs and guides users to public facilities, parks, schools, significant transit stops, and transportation facilities and commercial areas.	Sound Transit has considered pedestrian safety in development of the Lynnwood Link Extension alternatives and will continue to do so throughout project development. Signage and wayfinding designs would be developed with input from the City of Shoreline. Nonmotorized facilities are discussed in Chapter 3 of the Final EIS.

Table 4.2-10. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Transportation Master Plan

Specific Goals and Policies	Discussion
T18: When identifying transportation improvements, prioritize construction of sidewalks, walkways, and trails. Pedestrian facilities should connect to destinations, access transit and be accessible by all.	Same as Goal 17.1.
TRANSIT PLAN	
Goal T X: Support and encourage increased transit coverage and service that connects local and regional destinations to improve mobility options for all Shoreline residents.	The Lynnwood Link Extension would provide fast, reliable, and efficient connections to the city of Shoreline and the other urban centers in the corridor as well as regional destinations.
22.4: Support the ongoing programs of transit providers to provide bicycle racks on all buses and trains.	The Lynnwood Link Extension would support Sound Transit's updated Bicycle Policy (2009) to integrate bicycles with regional transit services and facilities where land use regulations allow. Basic elements of the policy include providing convenient means to secure bicycles, short- and long-term bicycle parking provisions, and facility design and layout that accommodate both bicycle and pedestrian movements.
T27: Work with transit agencies to improve east-west service across the City of Shoreline and service from Shoreline to the University of Washington.	The Lynnwood Link Extension is part of the Link light rail system and would directly connect to the northern terminus of the system at the Northgate Station, which is now under construction. From there, riders could continue south on the Link system to the University of Washington, Capitol Hill, downtown Seattle, and SeaTac. Separate projects to extend light rail to the south or east will also allow direct connections to Bellevue, Redmond, and Federal Way.
T29: Work with Sound Transit, the Shoreline School District, Washington State Department of Transportation, Metro Transit, the City of Seattle and Shoreline neighborhoods to develop the final light rail alignment and station area plans for the areas surrounding the future Link light rail stations.	Sound Transit and the City of Shoreline have been coordinating through the Lynnwood Link Extension planning phase and will continue to coordinate throughout the entire project.
29.1: Participate in the Sound Transit planning process and environmental review to identify the final alignment for light rail from Northgate to Lynnwood. Advocate for two stations in Shoreline that will result in the highest ridership, most cost-effective solution and compatibility with planned surrounding land uses. Should the final light rail alignment be located on I-5, it should be on the side(s) that takes advantage of potential TOD (transit-oriented development), increased employment and residential densities, and land in public ownership, such as the Shoreline Conference Center and NE 185th Street.	Same as Goal T29. In addition, as part of the Lynnwood Link Extension, two stations are planned within the city of Shoreline, with three potential locations along Interstate 5 at NE 145th, NE 155th, and NE 185th streets. Station ridership, cost-effectiveness, compatibility with planned surrounding land uses, and transit-oriented development potential are analyzed for each of the proposed station locations in the Final EIS.

Table 4.2-10. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Transportation Master Plan

Specific Goals and Policies	Discussion
29.2: Work with the neighborhoods and communities surrounding the future light rail stations to determine the types of land uses desired near the stations. Modify the City's land use policies and development regulations, as needed, to create the underlying zoning that will result in development of the stations as desired.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas. The project also would help to focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. Light rail stations are being designed to integrate access from other travel modes. Stations will be designed to fit in neighborhoods and facilitate transit use consistent with light rail best practices. Sound Transit will continue to work with the City of Shoreline to potentially modify the City's land use policies and development regulations to achieve growth in station areas.
29.3: Determine the desired and needed traffic mitigation for the station areas based upon the planned future land use and anticipated future traffic demand in the area, including provisions for bicycles and pedestrian facilities at and connecting to the stations.	The Final EIS outlines the avoidance, minimization, and mitigation measures for potential traffic impacts in the city of Shoreline associated with operation of the Lynnwood Link Extension.
29.4: Coordinate with Sound Transit during their planning process to ensure the City's future land use plans are considered and integrated into station area designs.	Sound Transit and the City of Shoreline have been coordinating through the Lynnwood Link Extension planning phase and will continue to coordinate throughout the entire project.
29.5: Closely monitor and participate in Sound Transit's required mode study, alternatives analysis and environmental process, and coordinate with cities to the north and south of Shoreline regarding Sound Transit planning and design.	Same as Goal T29.4.
T32: Continue to install and support the installation of transit-supportive infrastructure.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Stations would include amenities and considerations of patrons' needs, including weather protection, pedestrian comfort, and safety designs. Signage and wayfinding designs would be developed in cooperation with input from affected jurisdictions.
32.2: Ensure private developers continue to construct improvements that are transit-supportive.	The Lynnwood Link Extension would support transit-oriented development in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas that allow for increased density and also increase the walkability of the surrounding area.

Table 4.2-10. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Transportation Master Plan

Specific Goals and Policies	Discussion
T33: Work with Metro Transit, Sound Transit and Community Transit to develop a bus service plan that connects residents to light rail stations, high-capacity transit corridors, and park & ride lots throughout the City.	Sound Transit will continue to coordinate with the City of Shoreline and transit agencies to develop a transit service plan for Shoreline's stations.
T34: Implement traffic mitigation measures at light rail stations areas.	The Final EIS outlines the avoidance, minimization, and mitigation measures for potential traffic impacts in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas associated with operation of the Lynnwood Link Extension.
34.2: Work with Sound Transit to implement traffic mitigation in the light rail station areas, as developed in the station area planning process.	Same as Goal T34.
34.3: Improve bicycle and pedestrian facilities in the vicinity of the light rail stations to encourage nonmotorized transportation at stations.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Stations are being designed to integrate into the pedestrian-friendly environment and with context-sensitive design considerations. Bicycle racks are planned where appropriate.
34.4: Work with the City of Seattle, WSDOT, Sound Transit and Metro Transit to improve N/NE 145th Street from Lake City Way NE to Greenwood Avenue N in order to provide better east-west bus connections to the Aurora Avenue N BRT line, the light rail station at NE 145th Street and the future BRT line on Lake City Way NE.	Sound Transit will continue to coordinate with the City of Shoreline and other transit agencies.
T35: Promote livable neighborhoods around light rail stations through land use patterns, transit service and transportation access.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would be an alternative to the single-occupancy vehicle. It would also provide linkages to other travel modes, including rail, buses, and walking. Efficiencies in transportation and more walkable communities are shown to improve people's quality of life.
35.1: Ensure feeder routes to the light rail stations are serving all neighborhoods in Shoreline and operating at frequencies that encourage light rail use.	Sound Transit would work with local bus service providers to integrate bus service and planning for adequate bus transfers at the potential NE 145th Street, NE 155th Street, and NE 185th Street station locations.
35.2: Monitor traffic traveling to and from the light rail stations to ensure surrounding neighborhoods are not experiencing cut-through traffic or other negative impacts. Implement appropriate solutions to minimize impacts and improve safety.	The Final EIS outlines the avoidance, minimization, and mitigation measures for potential traffic impacts in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas associated with the operation of the Lynnwood Link Extension.

Table 4.2-10. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Transportation Master Plan

Specific Goals and Policies	Discussion
MASTER STREET PLAN	
T36: Design City transportation facilities with the primary purpose of moving people and goods via multiple modes, including automobiles, freight trucks, transit, bicycles, and walking, with parking identified as a secondary use.	The Lynnwood Link Extension would bring light rail transit to Shoreline. This fast, reliable, and efficient mode of transportation would provide linkages to other nonmotorized and transit options.
CONCURRENCY AND LEVEL OF SERVICE	
T40: Adopt the following levels of service as the desired frequency of transit service in the city of Shoreline: - Headways on all-day service routes should be no less than 30 minutes, including weekends and evenings (strive for 20-minute or less headways during the day on these routes). - Headways on peak-only routes should be no more than 20 minutes (strive for 15-minute or less headways on these routes).	The Lynnwood Link Extension would have 4-minute headways during peak hours, 10-minute headways during midday and early evening hours, and 15-minute headways during early morning and late evening hours.

City of Shoreline Environmental Sustainability Strategy

Plan Summary

Shoreline's Environmental Sustainability Strategy, adopted in 2008, is intended to establish an inclusive set of principles and priorities and provide strategic direction for the City to undertake in order to become an environmentally sustainable city. Actions included in the strategy address Shoreline's operations, future development, leadership, and planning processes, including prioritization of nonmotorized transportation investment planning. The Environmental Sustainability Strategy includes five focus areas: city operations, practice, and outreach; energy conservation and carbon reduction; ecosystem management and stewardship; sustainable development and green infrastructure; and waste reduction and resource conservation.

Consistency with Lynnwood Link Extension

Table 4.2-11 summarizes the relevant guiding principles, focus areas, and recommendations of the strategy and discusses how the Lynnwood Link Extension is compatible and in conformance with these principles.

Table 4.2-11. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Environmental Sustainability Strategy

Specific Goals and Policies	Discussion
TEN GUIDING PRINCIPLES	
6. Manage Expected Growth in a Sustainable Way: The regional benefits of growth management must not come at the expense of livability. Growth and density will be focused in environmentally sustainable areas and serviced by improved infrastructure, including non-motorized facilities, transit, and enhanced access to parks and natural features.	The Lynnwood Link Extension would support mixed-use development in designated urban areas and help focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
10. Energy Solutions are Key to Reducing Our Carbon Footprint: The City will reduce the amount of energy used in vehicles and facilities and promote sustainable energy sources. The City will evaluate energy use and carbon emissions and develop conservation targets. The City recognizes the relationship between energy and sustainable development principles. Transportation solutions and efficient buildings are key priorities for both.	Lynnwood Link Extension would be powered by electricity. In the Puget Sound region and areas that the Lynnwood Link Extension will serve, much of the power sources come from hydropower, which is a non-polluting power source. The Lynnwood Link Extension would reduce greenhouse gases during operation by reducing vehicle miles and hours traveled. The Lynnwood Link Extension would further regional policies related to reducing dependence on single-occupancy vehicles and increasing nonmotorized travel modes, especially within urban centers.
TOP 10 LIST OF KEY PROGRAM STRATEGIES	
4. Measure Emissions in Permitting and Planning and Take Steps to Mitigate: Evaluate energy consumption and greenhouse gas emissions in both long-range planning and development review decisions using quantitative tools. This includes implementation of this recommendation in State Environmental Policy Act (SEPA) review and the use of quantitative tools during the next major Comprehensive Plan update.	The Lynnwood Link Extension would provide an alternative means of transportation over the single-occupancy vehicle and would improve air quality and conserve energy. The Final EIS provides specific analysis on project energy consumption and greenhouse gas emissions.
5. Prioritize Non-Motorized Transportation Investment and Planning: Devote more planning and capital resources to developing a pedestrian and bicycle system as an attractive alternative to single-occupancy vehicles. Prioritize non-motorized transportation planning and improvements with a focus on linking destinations, including an emphasis on the development of the Green Streets program. Non-motorized transportation investment is a key item in the U.S. Mayor's Climate Protection Agreement.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Stations are designed to encourage pedestrian and nonmotorized accessibility.

Table 4.2-11. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Environmental Sustainability Strategy

Specific Goals and Policies	Discussion
FOCUS AREA 3: SUSTAINABLE DEVELOPMENT AND GREEN INFRASTRUCTURE	
Develop plans for a coordinated bicycle and pedestrian system which provides and connects to major destinations and offers an attractive alternative to other modes.	Same as number 5 on list of key program strategies.
Establish clear transit priorities, strengthen the land use and transportation link in adopted plans, and promote improvements that benefit Shoreline residents.	The Lynnwood Link Extension would bring a light rail transit option to Shoreline with potential stations located at NE 145th Street (Preferred Alternative and Alternatives A1, A3, A10), NE 155th Street (Alternatives A5, A7, A11), and NE 185th Street (Preferred Alternative, Alternatives A1, A3, A5, A7, A10, A11). The Lynnwood Link Extension would also connect with the Northgate Link Extension, University Link Extension, and East Link Extension, thus providing links in Shoreline to urban centers and regional destinations.
Promote a transit-supportive land use pattern that focuses new development nodes near existing and proposed transit corridors and improvements, especially along the I-5 corridor.	The Lynnwood Link Extension would support mixed-use development in designated urban areas and help focus the majority of growth in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
Promote natural solutions to stormwater management in private and public development with both incentives and requirements by revising engineering and development code standards, implementing CIP projects, and through public outreach.	The Lynnwood Link Extension would include stormwater detention and treatment to address impacts related to stormwater runoff and the designed systems. Sound Transit's Environmental Sustainability and Management System requires that low-impact operational stormwater management techniques be investigated and considered during the project design process.

City of Shoreline Light Rail Guiding Principles

Plan Summary

The City of Shoreline's Light Rail Guiding Principles, adopted in 2011, is a guiding document for Shoreline regarding future discussions and input to Sound Transit with respect to planning, construction, and operation of light rail to directly serve Shoreline residents. The document is organized into three major elements: Performance, Maximizing Funds, and Local Opportunities and Impacts.

Consistency with Lynnwood Link Extension

Table 4.2-12 summarizes the relevant Light Rail Guiding Principles and discusses how the Lynnwood Link Extension is compatible and in conformance with these principles.

Table 4.2-12. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Light Rail Guiding Principles

Specific Goals and Policies	Discussion
PERFORMANCE	
Support a light rail system that provides the shortest travel times for riders traveling to and from Shoreline.	The Lynnwood Link Extension would operate on a grade-separated guideway, thereby increasing travel time and reliability benefits. For example, transit travel times from Shoreline to downtown Seattle would be between 16 and 18 minutes under the 2035 light rail alternatives compared to 28 minutes under the 2035 No Build Alternative. Chapter 3 of the Final EIS presents more information regarding Lynnwood Link Extension transit travel times.
Support development of a complete light rail system that serves the Puget Sound region efficiently and minimizes travel times to destinations.	The Lynnwood Link Extension is part of the Link light rail system and would directly connect to the northern terminus of the system at the Northgate Station, which is now under construction. From there, riders could continue south on the Link system to the University of Washington, Capitol Hill, downtown Seattle, and SeaTac. Separate projects to extend light rail to the south or east will also allow direct connections to Bellevue, Redmond, and Federal Way.
Support the development of a light rail system that will serve the greatest number of riders traveling to and from Shoreline.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Station locations in Shoreline were chosen for proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans and optimum ridership potential.
Support the development of light rail stations that are easily accessed by foot, bicycle, bus, or car. The stations should expand opportunities for convenient access to other forms of transit, such as bus rapid transit and local bus service. Traffic impacts should also be minimized and mitigated in station areas.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Station designs consider all joining travel modes—pedestrian, passenger pick-up/drop-off, transit transfers, bicycles, and park-and-ride facilities. The Final EIS outlines the avoidance, minimization, and mitigation measures for potential traffic impacts in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas associated with both the construction and the operation of the Lynnwood Link Extension.

Table 4.2-12. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Light Rail Guiding Principles

Specific Goals and Policies	Discussion
MAXIMIZING FUNDS	
Ensure that as decisions are made, funding remains in the project budget to fund two light rail stations in Shoreline.	As part of the Lynnwood Link Extension, two stations are planned within the City of Shoreline, with three potential locations along Interstate 5 at NE 145th Street, NE 155th Street, and NE 185th Street.
Support minimizing costs associated with right-of-way acquisition and capital investments as well as ongoing operation and maintenance costs while maximizing performance of the light rail system.	The Lynnwood Link Extension would minimize right-of-way acquisitions to the extent possible in the city of Shoreline while still maximizing performance of the light rail system.
Support extension of a light rail system through Shoreline and Seattle that maximizes the available funding in the north King County subarea. In accordance with Sound Transit's subarea equity policy, funds generated in this subarea should be spent only in this subarea and be used to provide high quality transit services and amenities for north King County residents.	The Lynnwood Link Extension would extend light rail from the Northgate neighborhood of Seattle north to Shoreline, Mountlake Terrace, and Lynnwood.
LOCAL OPPORTUNITIES AND IMPACTS	
Support the location, alignment and operation of light rail that provides access to a socially, economically, and geographically diverse ridership.	The potential NE 145th Street, NE 155th Street, and NE 185th Street Station locations were chosen for their proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans.
Believe land uses around light rail stations should support transition to transit-oriented communities over time and in partnership with the local neighborhood.	The Lynnwood Link Extension supports transit-oriented development in the potential NE 145th Street, NE 155th Street, and NE 185th Street Station areas in Shoreline that allow for increased density, which would allow for more efficient use of land and allow for an efficient provision of services and facilities as well as promote walkable and cohesive neighborhoods. Sound Transit is coordinating with the City of Shoreline and will continue to do so regarding transit-oriented development at the selected City of Shoreline station sites.
Committed to a robust community involvement process that develops tools and plans to create and enhance vibrant, livable, and sustainable transit-oriented station areas.	Sound Transit has provided extensive opportunities for public involvement throughout the Lynnwood Link Extension planning phase and will continue public outreach throughout the entire project.

Table 4.2-12. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Shoreline Light Rail Guiding Principles

Specific Goals and Policies	Discussion
Ensure impacts on residents and businesses are managed and individual property rights are protected; provide timely information so residents can plan for and respond to changes.	Any private property acquisitions required for the Lynnwood Link Extension would be done in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act.
Support a light rail system that will foster economic prosperity in Shoreline by encouraging existing businesses, enhancing property values, creating family-wage jobs, building sustainable housing stock, and attracting investment.	The Lynnwood Link Extension would support mixed-use (commercial, office, and residential) development to allow growth at greater density where existing land use policies and regulations allow, and provide connections to urban centers with a fast, efficient, and reliable transit system.
Support the development of a light rail system that minimizes noise and visual impacts to Shoreline residents and businesses.	The Final EIS outlines the avoidance, minimization, and mitigation measures for potential noise and visual impacts associated with the operation and construction of Lynnwood Link Extension.

City of Shoreline 185th Street Station Subarea Planned Action Final EIS

Plan Summary

The 185th Street Station Subarea Plan involves land uses and zoning provisions for transit-oriented development in the subarea (located at a boundary between the Echo Lake, Meridian Park, and North City neighborhoods), as well as supporting public space enhancements, multimodal transportation and utility system improvements, and other associated public infrastructure and amenities. The Final EIS for this plan was published in November 2014, and comprehensive plan amendments are expected to be adopted in 2015.

The analyzed alternatives associated with the 185th Street Station Subarea includes the NE 185th Street Station proposed by Sound Transit in the Lynnwood Link Extension EIS. The 185th Street Subarea Planned Action Final EIS states that the final Subarea Plan is expected to result in a plan for transit-oriented land use and zoning provisions in the subarea as well as support for public space enhancements, multimodal transportation and utility system improvements, and other public infrastructure amenities associated with the plan. The proposed station at NE 185th Street would support Shoreline's goals and policies. No policy issues of concern to Sound Transit were identified.

The City of Shoreline's updated 2012 *Comprehensive Plan* already designates this location as a Light Rail Station Study Area. The City would support transit-oriented development at this location through the approval of a Subarea Plan.

Consistency with Lynnwood Link Extension

Although service is not scheduled to begin until 2023, Sound Transit's planning, design, and environmental review for construction of the light rail line, stations, and associated facilities is being coordinated with the City of Shoreline, which has been planning land use changes around the light rail stations to be located in Shoreline.

City of Mountlake Terrace Comprehensive Plan

Plan Summary

The City of Mountlake Terrace's Comprehensive Plan, which was first adopted in 2003 and last amended in 2011, provides coordinated goals, policies, maps, and strategies regarding the community's development, investment, and quality of life. It takes a broad perspective for a 20-year period and incorporates future needs for population and employment growth. The plan consists of 10 elements that each contain goals and policies for guiding growth in Mountlake Terrace: Community Livability; Environment; Economic Vitality; Housing; Land Use; Recreation, Parks, and Open Space; Transportation; Capital Facilities; Utilities; and Plan Administration. Sound Transit reviewed the elements to identify the applicable goals and policies. The only elements with applicable goals and policies were in the Land Use and Transportation elements.

Consistency with Lynnwood Link Extension

Table 4.2-13 summarizes the relevant elements of the City's comprehensive plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these.

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
LIVABILITY ELEMENT	
Goal CL-1: Livability for current and future generations.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would provide an alternative to single-occupancy vehicles and also provide linkages to other travel modes, including rail, buses, and walking. Efficiencies in transportation and more walkable communities are shown to improve people's quality of life.
CL-1.1: Promote a positive image of the city as a vibrant, thriving, and desirable place in which to live, work, shop, and play.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas and help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway, and optional 220th Street SW Station areas in Mountlake Terrace where existing zoning and land use

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
	codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
CL-1.4: Promote a pedestrian-friendly environment.	Same as CL-1.1 above.
CL-1.13: Promote a strengthened downtown commercial core and a healthy local economy.	The Lynnwood Link Extension would support mixed-use (commercial, office, and residential) development to allow growth at greater density, where existing land use policies and regulations allow, and provide the City of Mountlake Terrace with connections to and from urban centers with a fast, efficient, and reliable transit system.
ENVIRONMENTAL ELEMENT	
Goal EN-1: Clean air, clean water, and healthy natural environment.	The Lynnwood Link Extension would further regional polices related to reducing dependence on single-occupancy vehicles and increasing nonmotorized travel modes, especially within urban centers. It would also help reduce air pollution and conserve energy. The proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station would be located in areas designated for increased density, and the Lynnwood Link Extension would provide direct and frequent access to those areas as well as connections to regional destinations. Promoting transit and walkable communities would reduce vehicle miles and hours traveled and, therefore, would help reduce air pollution.
EN-1.6: Encourage convenient alternatives to automobile travel within the city and region.	Same as Goal EN-1.
EN-1.14: Promote the planting of trees and other vegetation for beautification, air quality, noise control, and stormwater management.	Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations while also reflecting the character of individual station areas. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.
ECONOMIC VITALITY ELEMENT	
EV-1.1: Encourage efficient use of existing buildable lands, including vacant and redevelopable sites.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas and help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace where existing zoning and

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
	land use codes allow for greater development densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, promoting walkable and cohesive neighborhoods, and protecting those areas where growth is not encouraged.
EV-1.3: Encourage mixed uses in designated areas.	Same as EV-1.1 above.
EV-1.4: Provide opportunities for adding new land uses to or near existing or planned parking structures, such as the Community Transit park-and-ride lot on 236th Street SW and I-5.	The Preferred Alternative and Alternatives B1 and B2 of the Lynnwood Link Extension would place the proposed Mountlake Terrace light rail station at the Mountlake Terrace Transit Center near the existing Community Transit park-and-ride lot. The Lynnwood Link Extension would support transit-oriented development by allowing a greater density and a mixture of land uses to occur in the station areas.
EV-1.5: Designate lands for commercial and industrial development, while protecting nearby residents from incompatible uses.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas and help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, promoting walkable and cohesive neighborhoods, and protecting those areas where growth is not encouraged. The Lynnwood Link Extension would provide fast, reliable, and efficient connections to the other urban centers in the project corridor and other urban communities, as well as regional destinations.
EV-1.10: Provide adequate infrastructure to support economic development to meet projected growth, within constraints of local resources.	Same as EV-1.5 above.
EV-2.3: Provide for a balanced transportation system that supports business needs, including pedestrians, transit, cars, and trucks.	The Lynnwood Link Extension would bring mass transit to the City of Mountlake Terrace as part of a balanced regional transportation system. Light rail station designs will consider all joining travel modes—pedestrian, passenger pick-up/drop-off, transit transfers, bicycles, and when possible and needed, park-and-ride facilities.
EV-2.5: Provide for good schools, parks, transportation, civic buildings, and other service amenities.	Same as above.
EV-2.7: Limit stress from noise, pollution, or traffic congestion.	The Lynnwood Link Extension would reduce noise and air pollution from motor vehicles by providing people with another mode of travel beyond single-occupancy vehicles.

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
LAND USE ELEMENT	
LU-1.1: Provide for a pattern of land use that will complement the community's physical characteristics, encourage pedestrian activity, revitalize the Town Center and give people opportunities to interact with each other in positive ways.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas and help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods.
LU-1.2: Respect the character of established residential neighborhoods and non-residential neighborhoods.	The proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station locations were chosen for their proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans and optimum ridership potential. The Final EIS evaluates how the Lynnwood Link Extension would perform with land use and transportation systems to minimize disruption and, where necessary, include mitigation measures to further reduce impacts on adjacent properties during construction. Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations while also reflecting the character of individual station areas. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.
LU-1.5: Retain or enhance scenic views whenever possible.	The Lynnwood Link Extension route and the proposed station alternatives in Mountlake Terrace generally follow Interstate 5, a major highway corridor, and would either be at-grade or elevated and would not affect scenic views in Mountlake Terrace. Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.
LU-2.2: Take reasonable measures to provide land uses that will meet the city's population target for 2012 and for subsequent planning periods.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
	Mountlake Terrace where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for efficient provision of services and facilities and promoting walkable and cohesive neighborhoods.
LU-2.3: Encourage innovative land use patterns and site development, such as Planned Unit Development and Mixed Uses, where appropriate.	Same as LU-2.2 above.
LU-2.6: Recognize that the City cannot take private property for public use without just compensation.	Any private property required for the Lynnwood Link Extension would be acquired in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act.
LU-3.3: Encourage development to express variety and reflect the area's unique characteristics.	The Lynnwood Link Extension would support a variety of mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace where existing zoning and land use codes allow for greater densities. Additionally stations are designed to fit in the neighborhoods and facilitate transit use consistent with light rail best practices.
LU-5.1: Encourage high-quality infill and redevelopment projects to revitalize the community.	Same as LU-3.3 above.
LU-5.4: Encourage co-location of development and mixed uses to enhance the community's image and convenience within or near public park-and-ride sites.	The Preferred Alternative and Alternatives B1 and B2 of the Lynnwood Link Extension would place the proposed Mountlake Terrace light rail station at the Mountlake Terrace Transit Center near the existing Community Transit park-and-ride lot. The Lynnwood Link Extension would support transit-oriented development by allowing a greater density and a mixture of land uses to occur in the station areas.
LU-5.6: Encourage development to be pedestrian- and bicycle-friendly and convenient for transit.	The Lynnwood Link Extension would provide the opportunity for transit-oriented development within designated urban centers around the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas. Such development would be designed to encourage pedestrian and nonmotorized accessibility.
LU-5.8: Support the regional land use and transportation plans by realizing the vision for the Mountlake Terrace Subregional Growth Center and the North Melody Hill Activity Hub as vibrant centers with jobs, transit access, walkability, and prominence as cultural and economic	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system as an alternative to single-occupancy vehicles and provide linkages to other travel modes, including rail, buses, and walking. Mountlake Terrace would benefit from the

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
destinations.	connections provided by the Lynnwood Link Extension among urban centers to the north as well as from adjacent communities served by the Central Link and Northgate Link Extensions. The Preferred Alternative and Alternative B2 of the Lynnwood Link Extension include an optional station at 220th Street SW; this could potentially bring transit access to the Melody Hill subarea.
LU-5.9: Concentrate major transportation funding in the Mountlake Terrace Subregional Growth Center and the North Melody Hill Activity Hub.	Same as LU-5.8 above.
TRANSPORTATION ELEMENT	
TR-1.1: Provide for safe transportation facilities that integrate the needs of transit riders, pedestrians, commuters, and motorists and take into account large vehicle movements.	The Lynnwood Link Extension would be designed to maximize safety, as well as provide fast and reliable transit access between urban centers and regional destinations.
TR-1.2: Make pedestrian and transit facilities safe and accessible for people with disabilities.	Sound Transit complies with Americans with Disabilities Act design requirements.
TR-2.1: Work with state, regional, and local agencies to meet or do better than meet air and water quality standards.	The Lynnwood Link Extension could improve air quality by promoting a reduction in automobile use with the introduction of a new transit alternative in the project corridor. The Lynnwood Link Extension would include stormwater detention and treatment to address impacts related to stormwater runoff. Sound Transit's Environmental Sustainability and Management System requires that low-impact operational stormwater management techniques be investigated and considered during the project design.
TR-2.4: Through the environmental review process, mitigate transportation projects to minimize pollution, noise, glare, and other adverse impacts.	The Final EIS outlines the avoidance, minimization, and mitigation measures for potential air quality, noise, visual, and other environmental impacts in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas associated with both the construction and the operation of the Lynnwood Link Extension.
TR-2.6: Encourage the provision of landscaping adjacent to transportation facilities for the purposes of stormwater management, noise reduction, air quality improvements, visual appearance, and pedestrian safety.	Same as TR-2.4 above.
TR-2.8: Support mode shifts from single-occupancy vehicles to alternative modes such as walking, bicycling, carpooling, vanpooling, and transit to reduce negative impacts to the environment caused by fossil-fueled	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system as an alternative to single-occupancy vehicles and provide linkages to other travel modes, including rail, buses,

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
transportation.	bicycling, and walking.
TR-3.1: Provide an efficient system for multiple modes of transportation.	Same as TR-2.8 above.
TR-4.8: Provide mobility for people driving, walking, bicycling, and using transit.	Same as TR-2.8 above.
TR-4.11: Ensure that multimodal concurrency standards are met by implementing critical pedestrian, bicycle, and transit improvements.	Same as TR-2.8 above.
TR-5.4: Encourage parking facilities, including park-and-ride facilities, to provide for mixed uses and multiple purposes.	The Preferred Alternative and Alternatives B1 and B2A of the Lynnwood Link Extension would place the proposed Mountlake Terrace light rail station at the Mountlake Terrace Transit Center near the existing Community Transit park-and-ride lot. An option for the Preferred Alternative and Alternative B2A would also develop a station at 220th Street SW. Lynnwood Link Extension would support transit-oriented development by encouraging greater density and a mixture of land uses to occur in the station areas, consistent with the City's land use plans.
TR-5.6: Provide for transportation projects needed to accommodate the City's share of future growth.	The Lynnwood Link Extension would support mixed-use (commercial, office, and residential) development to allow growth at a greater density where existing land use policies and regulations allow, and provide connections to urban centers with a fast, efficient, and reliable transit system.
TR-6.1: Encourage public transportation to be extended throughout the City at a level of service appropriate to the type of development in each area.	The Lynnwood Link Extension would have 4-minute headways during peak hours, 10-minute headways during midday and early evening hours, and 15-minute headways during early morning and late evening hours.
TR-6.3: Encourage improved transit service to other local and regional jurisdictions and to employment, shopping, and educational centers, including those in King County.	The Lynnwood Link Extension would provide fast, reliable, and efficient connections to the other urban centers in the project corridor and to other urban communities as well as regional destinations.
TR-6.4: Incorporate transit agency participation into the development review process, where applicable, to ensure site plans for new projects are compatible with and provide infrastructure necessary to support public transportation.	Sound Transit and the City of Mountlake Terrace have been coordinating throughout the Lynnwood Link Extension planning phase and will continue to do so throughout the entire project.
TR-6.5: Continue to facilitate the expansion of Link light rail from Seattle to Mountlake Terrace, primarily within the eastern portion of the Interstate 5 (I-5) right-of-way, and to include a light rail station in Mountlake Terrace at approximately I-5 and 236th Street SW, which shall be built in a manner that allows access from the recently built	The Lynnwood Link Extension would expand Link light rail north from Northgate through the cities of Shoreline, Mountlake Terrace, and Lynnwood. The Preferred Alternative and Alternatives B1 and B4 would travel primarily within the eastern portion of the I-5 right-of-way. While the Preferred Alternative and

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
transit center.	Alternatives B1 and B2A would have the Mountlake Terrace Transit Center Station located at the recently built Mountlake Terrace Transit Center, Alternative B4 would have the Mountlake Terrace Freeway Station located within the I-5 right-of-way. The Preferred Alternative and Alternatives B1 and B2A route would travel within the eastern portion of the I-5 right-of-way up to the Mountlake Terrace Transit Center Station at the existing Mountlake Terrace Transit Center, and then cross to the west side of I-5 as it continues north.
TR-6.8: Support transit ridership by providing strong pedestrian linkages to the Mountlake Terrace Transit Center and future light rail station.	The proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station would be designed to encourage pedestrian and nonmotorized accessibility.
TR-6.9: Preserve right-of-way and private land necessary for the construction of light rail.	After completion of the EIS process, selection of the Preferred Alternative, and final design, Sound Transit would begin the right-of-way acquisition process.
TR-6.10: Encourage development of high-capacity transit (especially light rail) on I-5 and express buses on I-5 and SR 99 to serve Mountlake Terrace.	The Lynnwood Link Extension would provide mass transit service to the City of Mountlake Terrace, generally following I-5, as well as to other urban centers along the project corridor and adjacent centers associated with the Central Link and Northgate Link Extension projects.
TR-6.11: Support innovative programs and encourage transit-oriented development to attract transit riders and make ridership convenient, fast, and comfortable.	The Lynnwood Link Extension would provide the opportunity for development of transit-oriented development within designated urban centers.
TR-7.1: Provide for a pedestrian system that: a. Connect residences, businesses, schools, parks, transit facilities, and civic buildings.	The Lynnwood Link Extension would support transit-oriented development in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace that allow for increased density and would increase the walkability of the surrounding area.
TR-7.2: Maintain and enhance the pedestrian system by: f. Providing for convenient connections to frontage pedestrian systems and transit facilities.	The proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station would be designed to encourage pedestrian accessibility.
TR-7.3: Prioritize improvements for sidewalks and pedestrian paths using the following criteria: e. Is this route also a route for transit or provide access to transit?	Same as TR-7.2 above.
TR-7.7: Incorporate pedestrian-oriented design into street improvements, street standards, and development projects.	Same as TR-7.2 above.

Table 4.2-13. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Mountlake Terrace Comprehensive Plan

Specific Goals and Policies	Discussion
TR-9.6: Reduce the need for parking facilities by increasing mode split from walking, bicycling, and transit.	The Lynnwood Link Extension would provide a fast, efficient, and reliable mode of travel as an alternative to single-occupancy vehicles and provide service to other urban centers in the project corridor and the region.

Mountlake Terrace Town Center, Freeway/Tourist District, and Multifamily Development Design Standards

Plan Summary

The City of Mountlake Terrace's Town Center, Freeway/Tourist District Design Standards and Multifamily Development Design Standards were adopted in 2008 and 2010, respectively. They present standards that apply to all development and redevelopment in the noted areas. The design elements for the Town Center, Freeway/Tourist District are intended to foster a cohesive pattern of development that supports pedestrian activity and transit-oriented development. The Design Standards for Multifamily Development similarly presents standards that apply to all development and redevelopment with respect to multifamily developments.

Consistency with Lynnwood Link Extension

Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations while also reflecting the character of individual station areas. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.

Mountlake Terrace Economic Vitality Strategy

Plan Summary

Mountlake Terrace's Economic Vitality Strategy, which was adopted in 2008, identifies goals, action strategies, and implementation steps to build a quality community where residents and businesses thrive through the facilitation of mixed-use development; investments in parks, recreation, and cultural arts; and improvements to streets and public infrastructure.

Consistency with Lynnwood Link Extension

Table 4.2-14 summarizes relevant goals of the Economic Vitality Strategy and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-14. Lynnwood Link Extension's Consistency with the Goals and Policies of the Mountlake Terrace Economic Vitality Strategy

Specific Goals and Policies	Discussion
Goal I: Create a Business and Development Climate that Facilitates Desirable Investment **A.** Continue to cultivate a culture supportive of economic development among City staff and residents. **1.** Define a Mountlake Terrace definition of "economic vitality" that is specific to the goals and values of Mountlake Terrace. Components include: • Increase population and population density in support of environmental sustainability and to create economic vitality and enhance the community's amenities and public services.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for efficient provision of services and facilities and promoting walkable and cohesive neighborhoods.
Goal II: Strengthen the City's Identity and Communications to Enhance the City's Image. **A.** Continue to define and build upon Mountlake Terrace's identity as a community. **2.** Incorporate discussion of the community's values in the City's communications with residents. Themes to address include: • A connected city that is an integrated part of the greater Seattle metropolitan area linked by transportation and employment patterns. • An active regional partner in sustainability efforts and care for the larger Puget Sound environment.	Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations while also reflecting the character of individual station areas. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS. The Lynnwood Link Extension is part of the Link light rail system and would directly connect to the northern terminus of the system at the Northgate Station, which is now under construction. Stations along the Lynnwood Link Extension would be located in Shoreline, Mountlake Terrace, and Lynnwood. From any of these stations, riders could continue south on the Link system to the University of Washington, Capitol Hill, downtown Seattle, and SeaTac. Separate projects to extend light rail to the south or east will also allow direct connections to Bellevue, Redmond, and Federal Way.
B. Facilitate the development of the Town Center as a community gathering place. **7.** Encourage transit, walking, and bicycling connections within and around the Town Center **i.** Prioritize the connections between the Town Center and the Recreation Pavilion, and the Town Center and the transit center/freeway station using sidewalks, streetlights, greenery, and street art to encourage walking between these nodes.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system as an alternative to the use of single-occupancy vehicles and would also provide linkages to other travel modes, including rail, buses, bicycling, and walking. Mountlake Terrace's Town Center would benefit from the connections Lynnwood Link Extension would provide among urban centers to the north as well as connections to adjacent communities served by the Central and Northgate Link Extensions.

Mountlake Terrace Sustainability Strategy

Plan Summary

Mountlake Terrace's Sustainability Strategy, which was adopted in 2008, identifies goals, action strategies, and implementation steps to create a livable community through the natural and built environment as well as to improve resource efficiency.

Consistency with Lynnwood Link Extension

Table 4.2-15 summarizes relevant goals of the Sustainability Strategy and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals.

Table 4.2-15. Lynnwood Link Extension's Consistency with the Goals and Policies of the Mountlake Terrace Sustainability Strategy

Specific Goals and Policies	Discussion
Goal I: Establish a Strong Foundation and Supportive Culture for Sustainability **E.** Engage partners in a collaborative approach to sustainability **2.** Meet with Snohomish Public Utilities District, Community Transit, and Sound Transit in launch process of this Strategy and on an ongoing basis to assess opportunities for collaboration.	Sound Transit will continue to coordinate and work with the City of Mountlake Terrace on issues of sustainability regarding the Lynnwood Link Extension.
Goal III: Maximize Energy-Efficient Mobility Options that Connect City Residents to the Places where they Live, Work, and Play. **G.** Continue to work with Community Transit, Sound Transit, and King County Metro to improve commuting options and service **1.** Coordinate with transit agencies to enhance services within Mountlake Terrace through: • Linkages among the Community Transit, Sound Transit, and King County Metro Systems serving the city • Promotion of the Community Transit Center	The Lynnwood Link Extension would bring to Mountlake Terrace a fast, efficient, and reliable transportation system that would also provide linkages to other travel modes, including rail, buses, bicycling, and walking. Residents of Mountlake Terrace would benefit from the connections Lynnwood Link Extension would provide among regional growth centers to the north as well as connections to adjacent communities served by the Central and Northgate Link Extensions.
2. Partner with Sound Transit to achieve light rail connectivity for Mountlake Terrace.	Sound Transit will continue to coordinate and work with the City on integrating the selected Mountlake Terrace station site with City plans.
3. Coordinate with the Washington State Department of Transportation, as well as transit agencies and others, to encourage transit-oriented development, recognizing opportunities associated with the new transit center and freeway station at I-5 and 236th Street SW.	The Lynwood Link Extension would support transit-oriented development in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace that allow for increased density and would also increase the walkability of the surrounding area. Sound Transit will continue to coordinate and work with the City on transit-oriented development at the selected Mountlake Terrace station site.

Mountlake Terrace Transit-Oriented Development Report

Plan Summary

The City of Mountlake Terrace Transit-Oriented Development Report provides analysis on future mixed-use development options for the upper portion of the I-5 park-and-ride at 236th Street SW. It also provides guidance to the City's efforts to identify opportunities for comprehensive plan elements, development regulations, and other tools that would encourage mixed-use housing and compatible transit-oriented development within the Mountlake Terrace urban core.

Consistency with Lynnwood Link Extension

The Lynnwood Link Extension would increase the opportunity for transit-oriented development to occur within Mountlake Terrace.

Mountlake Terrace Transit Service Strategy

Plan Summary

Mountlake Terrace's Transit Service Strategy, which was adopted in 2010, identifies the City's goals, priorities, and transit needs over the next 15 years. The Transit Service Strategy emphasizes the City's support for transit and also acts as a roadmap to increase transit services in Mountlake Service. The Transit Service Strategy is also aimed at helping the City ensure that its land use goals for the Town Center and other neighborhoods are met.

Consistency with Lynnwood Link Extension

Table 4.2-16 summarizes relevant goals of the strategy and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-16. Lynnwood Link Extension's Consistency with the Goals and Policies of the Mountlake Terrace Transit Service Strategy

Specific Goals and Policies	Discussion
CITY ACTIONS	
Goal 1: Provide municipal infrastructure to improve rider experience and increase ridership. **1.** Strive to ensure that sidewalks are available on both sides of the street on transit routes. **2.** Consider transit signal priority in transportation projects. **5.** Consider layover needs of any transit agency during roadway design.	The potential Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Stations would include amenities and considerations of patrons' needs, including weather protection, pedestrian comfort, and safety designs.

Table 4.2-16. Lynnwood Link Extension's Consistency with the Goals and Policies of the Mountlake Terrace Transit Service Strategy

Specific Goals and Policies	Discussion
Goal 2: Accommodate light rail at or near Mountlake Terrace's central station location—the Mountlake Terrace Transit Center. **2.** Once Sound Transit adopts a preliminary preferred alignment, consider adopting new regulations requiring all development along the preliminary preferred alignment to follow site design, which does not preclude light rail and will not require any demolition of recently built structures to construct light rail.	The Preferred Alternative and Alternatives B1 and B2A of the Lynnwood Link Extension would place the proposed Mountlake Terrace Transit Center Station at the Mountlake Terrace Transit Center, while Alternative B4 would have the Mountlake Terrace Freeway Station located on I-5.
Goal 3: Partner with transit agencies and local municipalities to garner the best possible service. **1.** Work with staff from Community Transit, Sound Transit, and King County Metro Transit to achieve our goals and their goals.	Sound Transit will continue to coordinate with the City of Mountlake Terrace on the Lynnwood Link Extension planning and design.
Goal 4: Support Transit Oriented Development **1.** Provide for efficient land uses. **2.** Encourage mixed use projects in key locations, such as the Town Center. **3.** Continue to implement the plan—A Vision for Mountlake Terrace Town Center—to provide transit-oriented development in the city. **4.** Consider ways to enhance transit-oriented development such as adjusting development regulations on parcels near the Mountlake Terrace Transit Center. **5.** Encourage changes to Washington State laws to allow tax increment financing to ease the economic bottom line of constructing transit-oriented development.	The Lynnwood Link Extension would support transit-oriented development in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace that allow for increased density. The increased density encourages more efficient use of land, thus allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. Sound Transit will continue to coordinate and work with the City on transit-oriented development at the selected Mountlake Terrace station site.
TRANSIT AGENCY ACTIONS	
Goal 1: Provide a higher level of service connecting the Town Center, North Melody Hill, and the Mountlake Terrace Transit Center than other areas of the city. **1.** Utilize taxpayer dollars on transit most efficiently by serving the densest land use areas in the city with proportionally more service than other areas of the city. **2.** Increase ridership per revenue hour in Mountlake Terrace by providing the greatest amount of service to the densest areas. **3.** Support transit-oriented development in the Town Center and North Melody Hill by providing necessary transit service.	Same as prior goal. The Lynnwood Link Extension would provide light rail transit service to the City of Mountlake Terrace, generally following I-5, as well as to other urban centers along the Lynnwood Link Extension corridor and adjacent centers associated with the Central Link and Northgate Link Extension projects. The Preferred Alternative and Alternatives B1 and B2A would place a light rail stop at the Mountlake Terrace Transit Center Station. The Preferred Alternative has an option for, and Alternative B2A includes, a station at 220th Street SW, which would also provide a connection from the transit center to the Melody Hill subarea. Alternative B4 would place a light rail station on the freeway adjacent to the existing transit center. Potential Lynnwood Link Extension station locations in

Table 4.2-16. Lynnwood Link Extension's Consistency with the Goals and Policies of the Mountlake Terrace Transit Service Strategy

Specific Goals and Policies	Discussion
4. Support Commute Trip Reduction programs in North Melody Hill and the Town Center. **5.** Retain and enhance transit service to North Melody Hill and Town Center to guarantee developers that their developments will be well served by transit.	Mountlake Terrace were chosen for their proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans and optimum ridership potential.
Goal 2: Balance access to transit with route efficiency in Mountlake Terrace. **1.** Provide transit service to neighborhoods in Mountlake Terrace. **2.** Provide connections to Town Center, North Melody Hill, the Mountlake Terrace Transit Center, and the Recreation Pavilion.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system and an alternative to the use of single-occupancy vehicles. It would also provide linkages to other travel modes, including rail, buses, bicycling, and walking. Neighborhoods in Mountlake Terrace would benefit from these connections.
Goal 3: Support regional connections to and from Town Center, North Melody Hill, and Mountlake Terrace Transit Center. **1.** Retain all day, bi-directional regional transit service to the Mountlake Terrace Transit Center from downtown Seattle and consider more all-day, bi-directional services. **3.** Support strong transfer synchronization from Mountlake Terrace Transit Center to North Melody Hill and Town Center to support regional trips.	The Lynnwood Link Extension is part of the Link light rail system and would directly connect to the northern terminus of the system at the Northgate Station, which is now under construction. Stations along the Lynnwood Link Extension would be located in Shoreline, Mountlake Terrace, and Lynnwood. From any of these stations, riders could continue south on the Link system to the University of Washington, Capitol Hill, downtown Seattle, and SeaTac. Separate projects to extend light rail east farther to the south will also allow direct connections to Bellevue, Redmond, and Federal Way.
Goal 4: Retain and enhance regional connections **1.** Downtown Seattle, University District, and Everett are major employment areas to which Mountlake Terrace residents need access. **2.** Reduce congestion on I-5 by enhancing transit service to the dense North Melody Hill and Town Center areas during peak commute times. **3.** Encourage easy access to regional transit as the system becomes more of a central spine with connections by synchronizing local transfers to regional transit.	The Lynnwood Link Extension would provide a fast, efficient, and reliable transportation system that would provide an alternative to the use of single-occupancy vehicles. Linking the urban centers with fast, reliable, and efficient transit would increase the effectiveness of bus transit service to outer areas of the Puget Sound region. This would help the overall transportation system operate more efficiently with fewer cars, and provide more walkable and livable communities with affordable transportation options.
Goal 5: Support direct connections to local centers **1.** Nearby centers in South Snohomish County and North King County, such as Downtown Lynnwood and Downtown Edmonds, are key connections for residents and employees. a) Work to synchronize transfers at critical transfer areas, such as the Edmonds Ferry Terminal and the Lynnwood Transit Center. **2.** Encourage these routes to be bi-directional.	Same as Goal 4 above.

Table 4.2-16. Lynnwood Link Extension's Consistency with the Goals and Policies of the Mountlake Terrace Transit Service Strategy

Specific Goals and Policies	Discussion
Goal 6: Encourage better connections over county line. **1.** The boundary between Snohomish and King Counties is arbitrary and cuts off transit service arbitrarily. Encourage better local cross-country service across the county line to increase transit usage. **2.** Work with Cities such as Shoreline to improve service across the county line. **3.** Consider transit partnerships to provide routes which go further into each county.	Same as Goal 4 above.
Goal 7: Accommodate light rail at or near Mountlake Terrace's preferred light rail station location—the Mountlake Terrace Transit Center. **1.** Encourage Sound Transit to adopt a preliminary preferred alignment and station in the vicinity of the Mountlake Terrace Transit Center. **2.** If resources allow, consider a second station in the vicinity of 220th Street SW and I-5.	The Preferred Alternative and Alternatives B1 and B2A of the Lynnwood Link Extension would place a light rail stop at the Mountlake Terrace Transit Center. The Preferred Alternative has an option for, and Alternative B2A includes, a station at 220th Street SW near I-5. Alternative B4 would place a light rail station on I-5 adjacent to the existing transit center.
Goal 8: Maintain usefulness of the freeway flyer station once the light rail station is operational. **1.** The investment in the freeway flyer station should remain useful once the light rail extension is constructed. **2.** Consideration should be given for a transfer point to light rail from other regional service, which will continue northward, such as the Sound Transit Route 510 or Community Transit routes.	Alternative B4 of the Lynnwood Link Extension would place a light rail station on I-5 at the Mountlake Terrace Freeway Station adjacent to the existing transit center. The freeway station would be extended to the north, retrofitted to accommodate light rail trains, and closed to bus use. Under all Segment B alternatives, the Lynnwood Link Extension could be inconsistent with Goal 8 if the alternatives lead to the closure of the freeway flyer station. However, when Sound Transit identified a Preferred Alternative for evaluation in the Final EIS, it directed further study of potential reuse of the flyer station.

Melody Hill Subarea Plan

Plan Summary

Mountlake Terrace's Melody Hill Subarea Plan, which was adopted in 2006, provides a long-term vision and plan for a 20-year period at a more detailed level than in the City's Comprehensive Plan. The subarea plan identifies major planning issues and provides recommendations, goals, and policies specific to the Melody Hill subarea to promote community livability, economic vitality, pedestrian and nonmotorized improvements, transportation mobility, improved access to the Interurban Trail, and a healthy environment.

Consistency with Lynnwood Link Extension

Table 4.2-17 summarizes relevant goals of the Melody Hill Subarea Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-17. Lynnwood Link Extension's Consistency with the Goals and Policies of the Melody Hill Subarea Plan

Specific Goals and Policies	Discussion
Goal MH-1: Efficient use of land **Policy MH-1.1:** Encourage efficient use of existing buildable lands, including vacant and redevelopable sites.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in the proposed Mountlake Terrace Transit Center, Mountlake Terrace Freeway Station, and optional 220th Street SW Station areas in Mountlake Terrace where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
Policy MH 1.4: Establish a land use pattern that complements the community's physical characteristics, enhances neighborhood livability, and promotes economic development in the Melody Hill subarea.	Same as above. The Preferred Alternative has an option for, and Alternative B2A includes, a station at 220th Street SW near I-5.
Goal MH-2: High-quality development **Policy MH-2.5:** Require commercial, industrial, and office development within the subarea to integrate pedestrian connections/improvements and transit access in their plans.	Same as Policy MH-1 above.
Goal MH-6: Neighborhood walkability **Policy MH-6.1:** Encourage a pedestrian and transit friendly neighborhood commercial center node at 220th Street/66th Avenue West.	The Preferred Alternative has an option for, and Alternative B2A includes, a potential station at 220th Street SW near I-5. The Lynnwood Link Extension would provide an alternative travel mode to single-occupancy vehicles and support the increased density currently existing and planned for after construction. Some pedestrian facilities such as sidewalks and street crossings would be improved as part of the project. There would also be improved pedestrian access to transit and the project would promote a more walkable neighborhood.
Goal MH-8: Neighborhood access and mobility **Policy MH-8.3:** Prioritize funding for transportation projects that emphasize safety, maintenance of existing facilities, mobility, demand management, linkages with regional transportation systems, and congestion reduction.	The Lynnwood Link Extension would provide a fast, efficient, and reliable mode of travel as an alternative to single-occupancy vehicles and provide connections to other urban centers in the project corridor and the region.

Table 4.2-17. Lynnwood Link Extension's Consistency with the Goals and Policies of the Melody Hill Subarea Plan

Specific Goals and Policies	Discussion
Goal MH-10: Convenient transit access **Policy MH-10.1:** Minimize negative impacts of traffic by continuing to develop non-motorized alternatives and encouraging transit, carpools, and other measures that reduce traffic congestion and pollution.	Same as Goal MH-8 above.

City of Lynnwood Comprehensive Plan

Plan Summary

The City of Lynnwood's Comprehensive Plan, which was first adopted in 1995 and most recently amended in 2011, provides coordinated goals, policies, maps, and strategies regarding the community's development, investment, and quality of life. It takes a broad perspective for a 25-year period and incorporates future needs for population and employment growth. The plan consists of eight elements that each contains goals and policies for guiding growth in Lynnwood: Land Use; Transportation; Housing; Parks, Recreation, and Open Space; Cultural and Historic Resources; Environmental Resources; Economic Development, Capital Facilities, and Utilities; and Implementation. Sound Transit reviewed the elements to identify the applicable goals and policies. The only elements with applicable goals and policies were in the Land Use, Transportation, and Environmental Resources elements.

Consistency with Lynnwood Link Extension

Table 4.2-18 summarizes relevant elements of the plan and discusses how the Lynnwood Link Extension is compatible and in conformance with these goals and policies.

Table 4.2-18. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Lynnwood Comprehensive Plan

Specific Goals and Policies	Discussion
LAND USE ELEMENT	
Goal: A balanced land use pattern that prevents urban sprawl, preserves and enhances residential neighborhoods, protects environmentally sensitive areas, protects people and property from environmental hazards, promotes economic development, and encourages community redevelopment at appropriate locations, resulting in a high quality physical environment for residents, workers, and visitors.	The Lynnwood Link Extension would support mixed-use development in designated urban growth areas and help focus the majority of growth in the proposed 200th Street SW, Lynnwood Transit Center, and Lynnwood Park-and-Ride Station areas in Lynnwood where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities

Table 4.2-18. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Lynnwood Comprehensive Plan

Specific Goals and Policies	Discussion
	as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged.
Subgoal: Density: Assure that the density of development is consistent with the local and regional development patterns, with available and planned infrastructure, with Growth Management Act requirements, and with surrounding land uses.	Same as the goal above.
Subgoal: Development Balance: Assure that the ratio of land areas for various developed uses accommodates regional market needs while maintaining a good balance between urban developed and natural, or open, land allocations.	The Lynnwood Link Extension would encourage increased density and a mixture of land uses, which promotes transit and more walkable communities. The proposed station location with Alternative C1 would best promote walkability within the City Center, while Alternatives C2 and C3 would promote walkability by locating the station toward 44th Avenue West. Compared to Alternative C3, the Preferred Alternative (C3 Modified) also would avoid bisecting a large block to the east of 44th Avenue West that the City of Lynnwood has identified for high-density development in its City Center Plan.
Subgoal: Single-Family Housing Retention: Assure preservation of existing single-family neighborhoods and community identity through protection from conflict with or encroachment of incompatible land uses or activities.	Land use changes are regulated by jurisdictions. The Lynnwood Link Extension alternatives and the proposed 200th Street SW, Lynnwood Transit Center, and Lynnwood Park-and-Ride Station locations were chosen for their proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans.
Subgoal: Urban Design: Establish and administer plans, policies, and regulations to improve the function and appearance of existing and new development and thereby enhance the livability and image of Lynnwood.	Lynnwood Link Extension facilities would be designed in coordination with the City to improve multimodal functions and seek opportunities to visually complement existing and future developments. Refer to Chapter 2 of the Final EIS for information on the project planning and development process.
Subgoal: Environment: Assure that developed uses of land avoid and protect environmentally sensitive areas and that such uses avoid and are protected from environmental hazard areas.	Sound Transit has considered environmentally sensitive areas in its development of the Lynnwood Link Extension alternatives and will continue to do so throughout project planning and development. Mitigation measures will be considered, as appropriate, for any impacts on environmentally sensitive areas that cannot be avoided.
Policy LU-6.1: The siting of public facilities shall follow these guideline: a) Public facilities should be centrally located in their service area. d) Facilities that serve the entire city shall be easily accessible from all parts of the city and should be minimized and then mitigate use-generated traffic or	The locations for Lynnwood Link Extension stations in Lynnwood were chosen to take advantage of public transit infrastructure already in place to serve the project corridor's travel needs. The proposed 200th Street SW, Lynnwood Transit Center, and Lynnwood Park-and-Ride Station sites met the needs for effective pedestrian, bicycle, transit, and automobile access. Also, adjacent

Table 4.2-18. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Lynnwood Comprehensive Plan

Specific Goals and Policies	Discussion
other impacts to residential neighborhoods. e) Facilities that serve regional needs shall be located in close proximity to regional transportation systems (freeways, arterials, or major public transit lines); such facilities shall minimize and then mitigate use-generated traffic or other impacts to residential neighborhoods. f) Regional facilities shall also be located in close proximity to supporting services. g) Public facilities serving regional needs should also be located near supporting or complementary uses and away from residential areas.	land uses and their population and employment are to be considered, as well as opportunities for transit-oriented development. The Preferred Alternative (C3 Modified) would reconfigure parts of the existing park-and-ride in order to develop the light rail station and a larger parking garage. It would feature a plaza connecting to the intersection of 200th Street SW/Alderwood Mall Boulevard/44th Avenue West, nearer to the core of the City Center subarea.
Policy LU-8.3: Establish a program to preserve historically and culturally significant sites, buildings, structures, landscapes, trees and artifacts.	Sound Transit has considered historic and culturally significant resources in development of the Lynnwood Link Extension alternatives and will continue to do so throughout project development. Mitigation measures will be considered, as appropriate, for any impacts on historic and culturally significant resources that cannot be avoided.
Policy LU-8.4: Provide adequate setbacks, buffers, landscaping, visual screens, and appropriate building scale and architecture to make development compatible with nearby residential and other land uses.	Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations while also reflecting the character of individual station areas. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood). Visual and aesthetic resources are discussed in Section 4.5 of the Final EIS.
Policy LU-8.19: Screening of elements such as recycling and waste collection areas, compactors and dumpsters, loading and service areas, and mechanical equipment shall be required so that these elements do not create a negative impact to the streetscape and nearby residential areas.	Same as Policy LU-8.4 above.
TRANSPORTATION ELEMENT	
Goal: To provide mobility for residents, visitors and commuters through a balanced system of transportation alternatives that supports the City's land use vision, protects neighborhoods from transportation impacts and minimizes adverse impacts on the environment.	The Lynnwood Link Extension would bring to the City of Lynnwood light rail transit—a fast, reliable, and efficient mode of transportation that would provide linkages to other nonmotorized and transit options. Sound Transit has considered transportation mobility in development of the Lynnwood Link Extension alternatives and will continue to do so throughout project development. Mitigation measures will be considered, as appropriate, for any impacts on transportation mobility that cannot be avoided.

Table 4.2-18. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Lynnwood Comprehensive Plan

Specific Goals and Policies	Discussion
Subgoal: Public Transit System: Work with the transit providers to make transit an attractive travel option for local residents, employees, and users of regional facilities.	The Lynnwood Link Extension would provide for an improved quality of life by providing a fast, efficient, reliable mode of travel, thus encouraging increased densities, where allowed, and promoting more walkable and cohesive neighborhoods.
T-11: Work with the transit providers to establish a hierarchy of transit services focused on three major elements: 1) neighborhood services, 2) local urban service, and 3) inter-community and regional services.	The Lynnwood Link Extension would focus on the element of inter-community and regional services. The Lynnwood Link Extension would be part of the Link light rail system and directly connect to the northern terminus of the system at the Northgate Station, which is now under construction. Stations along the Lynnwood Link Extension would be located in Shoreline, Mountlake Terrace, and Lynnwood. From any of these stations, riders could continue on the Link system to the University of Washington, Capitol Hill, downtown Seattle, and SeaTac. Separate projects to extend light rail to the south or east will also allow direct connections to Bellevue, Redmond, and Federal Way.
T-12: Continue working with Sound Transit on the development of the improvements to the park-and-ride lot.	Sound Transit and the City of Lynnwood have been coordinating through the Lynnwood Link Extension planning phase and will continue to coordinate throughout the entire project.
T-15: Work with private development and transit agencies to integrate transit facilities and pedestrian and bicycle connections to residential, retail, manufacturing, commercial office, and other types of developments.	Same as T-12 above.
T-15.A.: Ensure that Sound Transit's approved ST 2 project that will extend light rail service under ST 2 to Lynnwood includes one light rail station in the Core District of the City Center, serving the City Center, and a separate station at the Lynnwood Transit Center serving commuters. Lynnwood will partner with Sound Transit to implement and secure funding for this extension. Construction of the City Center station should be completed with the original 2023 timeframe.	The Lynnwood Link Extension would extend light rail services to the city of Lynnwood. There is one station planned in Lynnwood with four alternatives. The Preferred Alternative (C3 Modified) would reconfigure parts of the existing park-and-ride in order to develop the light rail station and a larger parking garage. It would feature a plaza connecting to the intersection of 200th Street SW/Alderwood Mall Boulevard/44th Avenue West, nearer to the core of the City Center subarea. Alternative C1 would place the Lynnwood light rail station at 200th Street SW (the 200th Street Station), slightly north of the existing Lynnwood Transit Center. A plaza and walkways would connect the station to the existing transit center. Under the Preferred Alternative (C3 Modified) and Alternatives C2 and C3, the Lynnwood light rail station would be located at the existing Lynnwood Transit Center. A second station is currently not funded.

Table 4.2-18. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Lynnwood Comprehensive Plan

Specific Goals and Policies	Discussion
Subgoal: Transportation Functionality and Safety: Maximize the functionality and safety of the local circulation system to guide the design of all transportation facilities, incorporating new materials and technology and responding to the needs of neighborhoods, visitors, and businesses.	The Lynnwood Link Extension would be designed to maximize safety and provide fast and reliable transit access between urban centers and regional destinations.
T-24.6: Encourage land uses that would generate relatively low volumes of traffic, or complementary peak periods, or would have the potential to increase the use of public transportation systems.	The Lynnwood Link Extension would provide an alternative to single-occupancy vehicles; maintain mobility; and provide fast, efficient, and reliable connections to urban centers. It would also encourage increased density and a mixture of land uses, which promote transit and more walkable communities.
Subgoal: Environmental Factors: Minimize the impacts of the transportations system on the city's environment and neighborhood quality of life.	The Lynnwood Link Extension would provide for an improved quality of life by providing a fast, efficient, reliable mode of travel; encouraging increased densities where allowed; and promoting more walkable and cohesive neighborhoods.
T-27: Evaluate projects and programs for consistency with environmental issues such as climate change, conservation, and sustainability as required by law and deemed appropriate.	The Final EIS evaluates the Lynnwood Link Extension for environmental issues as required under both the National Environmental Policy Act and the State Environmental Policy Act. The Lynnwood Link Extension would also be designed to comply with Sound Transit's Sustainability Program.
T-28: Minimize consumption of natural resources through the efficient coordination of traffic flow, the promotion of non-motorized alternatives, and the use of public transit.	The Lynnwood Link Extension would promote a reduction in automobile use by introducing a new, fast, reliable transit alternative that could result in improved air quality and conserve energy.
T-29: Minimize spillover parking from commercial areas, parks and other facilities encroaching on residential neighborhoods.	In neighborhoods where parking is currently not restricted, Sound Transit would work with the applicable jurisdictions to implement prevention strategies (i.e., time limits or neighborhood permit programs) where appropriate.
T-30: Preserve the safety of residential streets and the livability of residential neighborhoods by discouraging non-local traffic on streets classified as residential streets.	The Lynnwood Station would generate new vehicle trips to and from the park-and-ride lot because more capacity would be provided with the light rail alternatives. Trips to and from the station would be expected to use arterial streets; traffic volumes on local residential streets are not likely to increase due to increased park-and-ride use.
T-31: Develop a strong neighborhood traffic control program to discourage cut-through traffic on non-arterial streets.	Sound Transit and the City of Lynnwood have been coordinating through the Lynnwood Link Extension planning phase and will continue to coordinate throughout the entire project.

Table 4.2-18. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Lynnwood Comprehensive Plan

Specific Goals and Policies	Discussion
ENVIRONMENTAL RESOURCES ELEMENT	
Subgoal ER-2: Conservation of Resources and Recycling: A city government that strives to reduce consumption of resources; minimizes waste; reduces pollution; uses new technologies; promotes conservation, reuse, and recycling; encourages non-automotive transportation; and promotes the use of alternative fuels.	The Lynnwood Link Extension would promote a reduction in automobile use by introducing a new, fast, reliable transit alternative that could improve air quality and conserve energy.
Objective ER-2.1: Recycle and conserve resources through the implementation of the following policies: **Policy ER-2.6:** Work to reduce emissions of greenhouse gases from transportation by encouraging the use of non-automotive transportation by city employees and the public and measures that reduce vehicle miles traveled.	The Lynnwood Link Extension would be powered by electricity. In the Puget Sound region and areas the Lynnwood Link Extension would serve, non-polluting hydropower is a major source of power. The Lynnwood Link Extension would result in a decrease of greenhouse gases during operation by reducing vehicle miles and hours traveled. The Lynnwood Link Extension would further promote regional polices related to reducing dependence on single-occupancy vehicles and increasing nonmotorized travel modes, especially within urban centers.
Subgoal ER-8: Air Quality: Raise Lynnwood's level of livability by supporting efforts to reduce urban environmental air pollution and increase indoor environmental quality in city-owned buildings.	Same as Objective ER-2.1 and Policy ER-2.6 above. In addition, the Lynnwood Link Extension would help reduce air pollution and conserve energy. The Lynnwood Station alternatives would be located in areas designated for increased density, and the Lynnwood Link Extension would provide direct and frequent access to other centers in the project corridor, as well as provide connections to regional destinations. Promoting transit and walkable communities would reduce vehicle miles and hours traveled and therefore would help reduce air pollution.
Objective ER-8.1: Support the reduction of urban environmental air pollution to establish standards. **Policy ER-8.1:** Strive to reduce air pollution from all sources, including transportation, wood burning and industrial activities through appropriate land use and transportation policies.	Same as Objective ER 2.1 and Subgoal ER-8 above.
Policy ER-8.2: Support regional growth management activities that help reduce the need for automobile transportation and related air pollution.	Same as Subgoal ER-8 above.
Policy ER-8.3: Promote clean-burning, alternative-fueled vehicles for use by large fleet operators, transit operators, and the public as a way of reducing impacts on air quality.	Same as Subgoal ER-8 above.

Table 4.2-18. Lynnwood Link Extension's Consistency with the Goals and Policies of the City of Lynnwood Comprehensive Plan

Specific Goals and Policies	Discussion
Subgoal ER-10: Reduction of Noise Pollution: Minimize, to the extent practical, noise pollution through the implementation of the following policies: **Policy ER-10.6:** Promote actions, such as equipment modifications and operational limits that reduce noise from transportation modes, construction sites, industrial uses, and commercial business establishments.	Sound Transit's noise policy is committed to minimizing noise impacts that exceed applicable Federal Transit Administration and Federal Highway Administration noise standards at the source. In addition, Sound Transit has committed to a maintenance program that includes periodic rail grinding or replacement, wheel truing or replacement, vehicle maintenance, and operator training, which help to maintain low noise levels along transit corridors. Refer to Section 4.7, Noise and Vibration, of the Final EIS for mitigation of noise impacts.

Lynnwood Access Study

Plan Summary

The Lynnwood Access Study provides an analysis of I-5 operations in the near term and the future, including local transportation improvements to support access, egress, and through traffic for the city of Lynnwood and the City Center Subarea to and from I-5. This study considered the City Center Master Plan land use and traffic improvements proposed through 2025 and PSRC regional growth forecasts through 2032.

Consistency with Lynnwood Link Extension

The Lynnwood Access Study was reviewed by Sound Transit and incorporated, as relevant, into the planning and design of the Lynnwood Link Extension.

Lynnwood City Center Subarea Plan

Plan Summary

The Lynnwood City Center Subarea Plan, which was first adopted in 2005 and last revised in 2007, outlines a vision for the City Center in which the area will evolve from existing automobile-oriented land uses into a compact, vibrant downtown area with mixed-use, pedestrian-friendly, and transit-supportive land uses. The plan provides the legal and policy underpinnings for revisions to the City's codes, Capital Facilities Program, and administrative structure to allow for and encourage development within the City Center.

Consistency with Lynnwood Link Extension

Table 4.2-19 summarizes relevant elements of the City Center Subarea Plan and discusses how the Lynnwood Link Extension is compatible and in conformance with this plan.

Table 4.2-19. Lynnwood Link Extension's Consistency with the Goals and Policies of the Lynnwood City Center Subarea Plan

Specific Goals and Policies	Discussion
LAND USE	
CCLU 2: Concentration and Intensity The City Center will be the focus of high concentrations of development, containing multi-story buildings, multiple residential development, parking structures, and a variety of civic buildings and spaces.	The Lynnwood Link Extension would support mixed-use development (commercial, office, and residential) in designated urban growth areas and would help focus the majority of growth in the potential 200th Street SW Station, Lynnwood Transit Center, and Lynnwood Park-and-Ride Station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods.
TRANSPORTATION	
CCT 11: Reduce Vehicle Trips Work with City Center property and business owners to develop and implement effective vehicle demand management strategies to reduce vehicle trips generated by commuting City Center workers.	The Lynnwood Link Extension would reduce dependency on automobiles by providing a fast, efficient, and reliable mode of travel with linkages to other modes, and also support development in those areas targeted for growth.
CCT 12: Increase Transit Service Work with Community Transit and Sound Transit to increase transit services for the City Center.	The Lynnwood Link Extension would provide mass transit, which is a fast, reliable, and efficient mode of travel that would provide linkages to other nonmotorized and transit options.
CCT 15: Bicycle Storage Provide bicycle storage facilities or bicycle racks at the transit center and other destinations within the City Center.	The Lynnwood Link Extension would support Sound Transit's updated Bicycle Policy (2009) to integrate bicycles with regional transit services and facilities where land regulations allow. Basic elements of the policy include providing a convenient means to secure bicycles, short- and long-term bicycle parking, and a facility design and layout that accommodate both bicycle and pedestrian movements.
CC 19: Mixed Use Development Allow mixed-use developments to provide reduced parking supply.	The Lynnwood Link Extension would support transit-oriented development by allowing greater density and a mixture of land uses in the potential 200th Street SW Station, Lynnwood Transit Center, and Lynnwood Park-and-Ride Station areas. The increased density would allow for more efficient use of land, thus allowing for an efficient provision of services and facilities, as well as promoting walkable and cohesive neighborhoods.

Lynnwood City Center Design Guidelines

Plan Summary

The Lynnwood City Center Design Guidelines set forth guidelines for all development and redevelopment within the Lynnwood City Center. These guidelines are based on the Planning and Urban Design Principles of the City Center Subarea Plan.

Consistency with Lynnwood Link Extension

Sound Transit would develop design criteria that provide a consistent architectural theme for all elevated elements and for features such as stations while also reflecting the character of individual station areas. These criteria would be developed with input from the Cities through which the project corridor passes (Seattle, Shoreline, Mountlake Terrace, and Lynnwood).

City of Lynnwood Mode Split for City Center Street Master Plan

Plan Summary

The City of Lynnwood Mode Split for City Center Street Master Plan was prepared to include an analysis of the effects of the proposed ST2 projects, including light rail transit extensions into the City Center, station placements within the City Center, and opportunities for station placement to serve as a catalyst for transit-oriented development. This report also evaluates alternative station locations from the perspective of general transit guidelines and the City of Lynnwood.

Consistency with Lynnwood Link Extension

The Lynnwood Link Extension would extend light rail services to the City of Lynnwood. There is one station planned in Lynnwood with four alternatives. Alternative C1 would place the Lynnwood light rail station at 200th Street SW (the 200th Street Station), slightly north of the existing Lynnwood Transit Center. A plaza and walkways would connect the station to the existing transit center. Under Alternatives C2 and C3, the Lynnwood light rail station would be located at the existing Lynnwood Transit Center. The Preferred Alternative (C3 Modified) would reconfigure parts of the existing park-and-ride in order to develop the light rail station and a larger parking garage. It would feature a plaza connecting to the intersection of 200th Street SW/Alderwood Mall Boulevard/44th Avenue West, nearer to the core of the City Center subarea.

The analysis presented in the City of Lynnwood Mode Split for City Center Street Master Plan was reviewed by Sound Transit and considered in developing the project alternatives.

Lynnwood Local Improvement District Feasibility Study

Plan Summary

The Lynnwood Local Improvement District (LID) Feasibility Study collected property data and developed a range of potential special benefits that could be used to estimate the potential for LID funding for transportation infrastructure in the City Center subarea.

Consistency with Lynnwood Link Extension

The results of the Lynnwood LID Feasibility Study were reviewed by Sound Transit as part of the collaborative approach to considering station area planning with the City. Sound Transit supports these and other local funding mechanisms as a way to help provide supporting infrastructure to maximize the benefits of the regional transit investment.

APPENDIX I-4.5

Visual and Aesthetic Resources

APPENDIX I-4.5 VISUAL AND AESTHETIC RESOURCES — BACKGROUND INFORMATION

Introduction

This description of the existing visual conditions within the Lynnwood Link Extension Project study area is based on the visual assessment system developed by the Federal Highway Administration (FHWA). The approaches and terminology used in this assessment are found in FHWA's Visual Impact Assessment for Highway Projects (FHWA 1981). This appendix also assesses the project's consistency with visual resource goals and policies of relevant agencies, including the Washington State Department of Transportation (WSDOT), which is responsible for the Interstate 5 (I-5) corridor, and local government comprehensive plans.

The assessment of existing visual quality is concerned with the character of the visual experience for a typical viewer. The assessment of visual quality is subjective. A person perceiving the visual environment brings personal and cultural frames of reference to the discernment and evaluation of visual information. There is, however, broad agreement in federal, state, and local regulations as well as from research that establishes general public consensus on what constitutes a desirable visual environment.

The WSDOT Roadside Policy Manual (M 3110.01) provides the most explicit guidance for the treatment of portions of the right-of-way outside the vehicular travel lands. This applies to all lands managed by WSDOT and may extend to sites outside the right-of-way boundaries. Within the project area, there are two relevant classifications:

- Forested Roadside: The Forested landscape is predominantly natural or naturalized trees. A Forested roadside is characterized by natural-appearing landforms and native trees and/or understory vegetation. Zone 2 may be meadow or shrubs. Forest may appear different from location to location due to climatic and elevation differences.
- Built Character: Built character indicates a landscape in which human elements and structures are notable or predominant in the overall context. Built character includes suburban and urban areas. Once structures dominate the natural environment and human manipulation of the land is dominant, the roadside is considered to have a Built classification. Vegetation may be native or non-native within a setting that has a predominance of built elements such as buildings, walls, and bridges. In some locations, a more consistent, refined appearance is evident throughout the management zones. Special attention is given to architectural detail within suburban and urban areas and on Scenic Byways. Roadside management is used to develop a consistent, informal, and moderately refined appearance.

WSDOT uses a system of zones to categorize roadside activities. Figure 1 shows those zones as they relate to Project Design and Maintenance activities.

These zones are all outside of the travelled roadway and shoulders.

Zone 1 includes areas adjacent to the pavement that are vegetation-free or routinely mowed.

Zone 2 includes the "Clear Zone" as defined in the Design Manual as the roadside border area available for use by errant vehicles. This area may consist of a shoulder, a recoverable slope, a no recoverable slope, and/or a clear run-out area. The median is part of a clear zone. In a Forested Roadside, Zone 2 may be meadow or shrubs.

Zone 3 includes the area beyond the clear zone up to the right of way line and typically contains native or naturally occurring vegetation.

The WSDOT Design Manual (M 22-01.11)Chapter 900 also provides guidance.

The Washington State Department of Transportation (WSDOT) recognizes roadsides as an asset. WSDOT manages roadsides, balancing operational and environmental functions and lowest life cycle costs consistent with a reliable, safe, and sustainable transportation system. The roadside is the primary place used to blend transportation facilities into the context of the natural and built environments. The roadside is the green infrastructure that contributes to the transportation system. It integrates natural processes into the built environment and includes the concepts of low-impact development (LID).

Good roadside design coordinates many elements, including, but not limited to: structures; vegetation; signs; pedestrian and bicycle movement; stormwater treatment facilities; and other right of way functions. All the elements work together to provide visual continuity in the highway corridor. Highway Beautification Act Lands on I-5 include land outside of the right-of-way acquired in accordance with the Highway Beautification Act of 1965 (23 United States Code [USC] 319, Landscaping and Scenic Enhancement) which provided separate funding for roadside development. These lands were acquired in accordance with the following provisions:

- 23 Code of Federal Regulations (CFR) 752 .2 Policy

  (a) Highway esthetics is a most important consideration in the Federal-aid highway program. Highways must not only blend with our natural, social, and cultural environment, but also provide pleasure and satisfaction in their use.

  (c) The development of the roadside to include landscape development, safety rest areas, and the preservation of valuable adjacent scenic lands is a necessary component of highway development.

- 23 CFR 752.9 Scenic lands.

  (a) Acquisition of interests in and improvement of strips of land or water areas adjacent to Federal-aid highways may be made as necessary for restoration, preservation, and enhancement of scenic beauty.

  (b) Scenic strip interests may be acquired in urban or rural areas, combined in one or more projects, authorized separately whether or not there is or has been a Federal-aid project on the adjoining Federal-aid highway.

  (c) Approval of acquisition and development of scenic strips on completed Interstate should be conditioned on a showing that the acquisition of scenic strips was considered under the Highway Beautification Program for that particular section of Interstate.

If any of these areas are altered or used for other purposes, FHWA requires mitigation for the square footage and function.

1.1 Local Jurisdictions

Local jurisdictions have a variety of policies and regulations that relate to visual quality, aesthetics, and neighborhood character. Washington State's Growth Management Act (GMA) requires state and local governments to manage statewide growth by identifying urban growth areas (UGAs) and preparing comprehensive plans, capital improvement programs, and development regulations. The GMA does not have specific mandates to consider visual and aesthetic concerns. The GMA, however, does refer to "ensuring the vitality and character of established residential neighborhoods" (Revised Code of Washington [RCW] 36.70A.070(2)). The comprehensive plans and land use regulations of the jurisdictions through which the proposed Lynnwood Link Extension routes pass are summarized to provide criteria to evaluate impacts of the proposed project alternatives.

City of Seattle

Seattle's most relevant polices are in the State Environmental Policy Act (SEPA) and Agency Decisions Specific environmental policies in the Seattle Municipal Code (SMC) 25.05.675(2)(a).

It is the City's policy to protect public views of significant natural and human-made features: Mount Rainer, the Olympic and Cascade Mountains, the downtown skyline, and major bodies of water, including Puget Sound, Lake Washington, Lake Union, and the Ship Canal, from public places consisting of the specified viewpoints, parks, scenic routes, and view corridors.

None of the public places from which views are protected are present within the project corridor except for I-5, which is designated a scenic route.

City of Shoreline

Shoreline's Comprehensive Plan Community Design Element Goals & Policies document contains a number of relevant policies generally similar to Goal CD I, as described in Appendix I-4.2, Land Use Plans, Goals, and Policies.

City of Mountlake Terrace

Mountlake Terrace's Comprehensive Plan Land Use Element contains a number of relevant policies generally similar to Policy LU-1.5, which includes the City's transportation facilities:

- Retain or enhance scenic views, whenever possible.

City of Lynnwood

Lynnwood's Comprehensive Plan Land Use Element contains a number of relevant policies, including the following:

- Views may be protected through height restrictions, sign controls, view corridor requirements, and landscaping regulations. View corridors are openings in the urban landscape that allow views of important features such as historical buildings, mountains, shorelines, and parks. Lynnwood's topography provides limited views of the Olympic and Cascade Mountains and Mount Rainier.

Specific regulations relating to transportation facilities include:

- 17.05.100 Aesthetics. A. Development which maintains and improves the existing aesthetic character of the community should be encouraged. It is the policy of the city that:
  - Existing vegetation should be preserved for the maximum possible time before being cleared for development.

STUDY AREA

The area of visual quality analysis is defined by the viewshed from which salient aspects of the proposed project alternatives can be seen. These viewsheds constitute the study area for the aesthetics and visual quality analysis. The analysis area extends at least 500 feet on either side of the project alignments, but in some cases the viewshed is larger, depending on topography, the scale of the project features, and viewpoints available.

The assessment of existing visual quality and viewsheds was based on site visits, examining aerial photographs, reviewing conceptual engineering drawings of the proposed alternatives, reviewing existing plans and policies, and preparing an inventory of relevant existing conditions.

Three concepts were used in defining existing visual quality within the viewsheds.

Visual Character refers to identifiable visual information. Visual character may be distinguished both at the level of specific elements and at the level of relationships among elements. The first step in assessing visual effects is to describe visual attributes and environmental features using objective descriptors (such as form, line, color, and texture).

Four key features are used to identify relationships between elements of the visual environment: dominance, scale, diversity, and continuity. The integration of these elements results in a complete description of the character of a view.

> **Dominance** refers to the position of an individual element, or its extent or contrast among all the other elements of a view.
>
> **Scale** refers to apparent size relationships between an element and the other components of its surroundings.
>
> **Diversity** is a function of the number, variety, and intermixing of elements in a view.
>
> **Continuity** refers to the maintenance of visual relationships between connected or related landscape features.

Viewers are categorized as having high, average, or low sensitivity to changes in the landscape they observe.

> **High Viewer Sensitivity** generally describes the experience of people who are in an area to enjoy its visual features. Tourists and recreational users attracted to an area of natural beauty, or an urban landscape with unique features, or historic associations are among the most sensitive to visual features. Residents of an area also typically are very sensitive to change in the landscape because they are familiar with a landscape and view it frequently.
>
> **Average Viewer Sensitivity** generally describes the experience of people who view the visual context as a secondary feature of other activities. People who are engaged in activities that require them to focus on features other than the landscape, such a driver passing through an area, are likely to be less sensitive to the visual context. An exception may be drivers with the option of selecting several routes who chose a particular route for its visual quality or drivers and passengers taking a scenic route. Persons at work or shopping or engaged in other purposeful activities may value a pleasant environment but generally are not at a specific location for the purpose of enjoying the scenery.
>
> **Low Viewer Sensitivity** generally describes the experience of persons engaged in activities that render the quality of their surroundings as irrelevant or incidental.

Visual quality refers to the perception of the visual experience by viewers and is described in terms of several parameters.

> **Vividness** refers to the way landscape components combine in distinctive and memorable visual patterns. For different landscapes, various elements may contribute to vividness.
>
> **Intactness** refers to the integrity of natural and human-built visual patterns, the extent to which the scene "hangs together." The evaluation of intactness also includes the extent to which the landscape is free from encroaching elements. Encroaching elements may include a single eyesore or multiple elements.
>
> **Unity** refers to the visual coherence and compositional harmony of the landscape considered as a whole. It refers to the fit between elements of the landscape but does not connote uniformity in design or character. In some cases, landscapes also have unity due to a common design milieu or association with historical events.

The visual quality of an area has a complex relationship to viewer sensitivity. In an area with high visual quality, such as a spectacular view, a person who does not regularly see the view or is distracted by the driving experience may still place a high value on the view. In an area with low visual quality, persons still may object to views that fall short of their visual goals for the area.

1.2 Segment A Viewsheds

1.2.1 Viewshed 1: NE 92nd Street to NE 115th Street

Viewshed 1 is in the Northgate area, a large retail, office, multifamily, and institutional area with the Northgate Mall and surrounding shopping area as its main feature. A variety of moderate intensity office uses as well as large multifamily complexes are located on both sides of I-5. The 60-acre North Seattle Community College campus is west of I-5.

The southern boundary of Viewshed 1 is NE 95th Street. The south side of NE 95th Street is south of the planned Northgate Link Light Rail station. This street provides a readily identifiable topographical and visual break in the residential neighborhood to the south and a readily identifiable overpass on I-5 leading to a downgrade in which the Northgate Mall and North Seattle Community College are the most notable features.

The northern boundary of Viewshed 1 is NE 115th Street. The north side of NE 115th Street, which is within the residential area north of the Northgate commercial area, is the approximate boundary between multifamily development to the south

and single-family residential development to the north. This street is at the beginning of a highway curve where the character of I-5 changes.

The eastern boundary of Viewshed 1 is generally the topographic ridge east of Roosevelt Way (10th Avenue NE). The visual boundary is generally much narrower and defined by local topography and view blockage by mature trees or buildings. South of NE Northgate Way (NE 110th Street), views of the light rail corridor east of 3rd Avenue NE are generally blocked by large buildings, including Northgate Mall, the Thornton Place mixed-use development, and multistory buildings along 1st Avenue NE south of NE 100th Street. North of NE Northgate Way, views of the light rail corridor are limited to adjacent buildings and streets that end at I-5. Large multifamily buildings block views to NE 115th Street except from upper floors. North of NE 115th Street, single-family residences, large trees, and the noise wall along I-5 block most views from a distance greater than a city block. The exception would be with the proposed Alternative A3 elevated crossing over NE 117th Street.

The Viewshed 1 western boundary is generally the topographic ridge along Dayton Avenue North about a mile from I-5. The visual boundary is generally much narrower and defined by local topography and view blockage by mature trees or buildings. South of North 113th Street, views of the light rail corridor west of Meridian Avenue North are generally blocked by large buildings, including the North Seattle Community College and office and multifamily buildings. In most cases, views are limited to the upper floors of buildings facing I-5 because the highway is higher than the topography to the west. North of North 113th Street, views of the light rail corridor are limited by topography and noise walls along I-5. The exception would be the proposed Alternative A3 elevated crossing over NE 117th Street.

Northgate Mall occupies the area immediately east of the light rail corridor on the east side of I-5, with buildings up to 60 feet high that extend from Northgate Way (NE 110th Street) south to NE 103rd Street. The shopping center is surrounded by surface parking lots with landscaping that provides a continuous tree canopy when viewed from the middle distance. South of the shopping center is the Thornton Place mixed-use development, which consists of a multistory parking garage, a multistory theater complex, and a multistory residential use that extends to about NE 102nd Street. South of NE 102nd Street, existing uses consist of three- to five-story office buildings and residential uses. North of Northgate Way is a mix of multifamily uses ranging from two to five stories high and commercial uses ranging from one to several stories high. East of 5th Avenue NE, existing uses are primarily one-story retail with surface parking.

West of I-5, the largest use is North Seattle Community College between North 92nd Street and North 103rd Street. The college campus includes one- to three-story buildings and an extensive parking lot with extensive landscaping. North of

the college are four- to six-story office and residential buildings, with some smaller-scale retail along Northgate Way.

Visual Character

I-5 is about 350 feet wide (shoulder to shoulder) in the Viewshed 1 area, with interchange and collector-distributor lanes up to 600 feet wide. It is generally equivalent to 10 to 12 lanes south of Northgate Way. The highway character is consistent with the Roadside Classification Plan of semi-urban, which envisions a prevalence of built environment features intermixed with natural or naturalized elements.

The roadway orientation is almost due north-south. I-5 curves to the east at about North 113th Street. Views to the north end with a skyline of evergreen trees in the distance. To the south, the view terminates in a topographic break at about NE 87th Street. At the termination of the view, the highway corridor is framed on both sides by the tops of evergreen trees. The downtown Seattle skyline is not visible to the south from this viewshed.

I-5 is framed to the east by stands of native trees that vary in the extent to which they screen views. Northgate Mall and parking garages dominate the view in the middle distance. The eastern horizon elements consist of distant continuous stands of treetops.

The roadside to the west of I-5 in Viewshed 1 is framed by sparse vegetation to NE 112th Street, where a noise wall begins. Western horizon elements include continuous stands of treetops, with the upper floors of buildings at North Seattle Community College and apartment buildings dominating the middle distance between Northgate Mall, North 105th Street, and North 110th Street.

There are no major natural features on this section of I-5. The central visual element for vehicle occupants is the linear character of the horizontal travel lanes with consistent texture and color. The highway is framed by managed vegetation outside of travel lanes that varies in texture and color according to its density and maturity. In places, mature evergreen trees at the margins of the highway provide the dominant features of the corridor because of their greater visual interest as compared to linear features. In Viewshed 1, large-scale urban buildings such as the multistory Northgate Mall, offices, and apartment buildings dominate the landscape because they are the largest and most prominent features. Other elements have a variety of size, character, styles, and continuity in this viewshed.

East of I-5, the highway is a substantial component of the landscape for viewers in and west of large buildings such as Northgate Mall, offices, and apartment buildings. The highway is elevated above surrounding topography, and its linear features and vehicles on the roadway are screened to various extents by landscaping within the

right-of-way and landscaping, street trees, and parking lot trees that generally interrupt ground-level views to the west. East of the large buildings and in the residential areas farther to the east, the major component of views is large-scale urban buildings, which generally block views of I-5. West of I-5, the major component of views include multistory apartment and office buildings. I-5 is visible only from the closest buildings and parking lots because views are blocked by buildings and landscaping. The dominant elements in the landscape are large buildings with a diversity of scale and design features.

Viewer Sensitivity

Viewers of the landscape in the Viewshed 1 area consist of drivers and occupants of about 200,000 vehicles per day who travel through the area, drivers and occupants of vehicles on local arterials, and shoppers at Northgate Mall and other establishments. Office and residential occupants of multistory buildings are a much smaller component of the potential viewing population. All viewers are likely to be of low to average sensitivity.

Visual Quality

Visual quality of views from I-5 in Viewshed 1 is low. Vividness is low. There are no near, middle, or distant features that are distinctive or memorable. Intactness is moderate; the highway has consistent character consistent with the Roadside Classification Plan of semi-urban, with built environment features intermixed with natural or naturalized elements. Unity is low to moderate. The consistent character of I-5 travel lanes, with high-intensity urban uses on both sides moderated somewhat by vegetation, results in a moderate level of visual coherence and compositional harmony between the various elements of the highway and surrounding landscape.

Visual quality is low to medium for all viewer groups in land uses on both sides of I-5 in Viewshed 1. There are no distinctive or memorable features. Urban uses on both sides of I-5 provide some compositional harmony through similar building scale and moderately dense landscaping, which results in a similar street-level character over most of the area. The visual quality looking towards I-5 from the neighborhood is composed of prominent roadway elements and vehicles visible from nearby properties that vary from the scale and character of urban commercial and multi-family residential buildings and streetscapes. The visual character of Viewshed 1 is illustrated in photographs of Viewpoint 1 from I-5 northbound, Viewpoint 2 at 1st Avenue NE and NE 97th Street, and Viewpoint 3 at 1st Avenue NE and NE 113th Street.

1.2.2 Viewshed 2: NE 115th Street to NE 133rd Street

The northern boundary of Viewshed 2 is defined by a transition in topography as well as between a single-family residential area on the east side of I-5 and Jackson Park Golf Course. The topography slopes up gradually toward NE 130th Street.

The eastern Viewshed 2 boundary is generally the topographic ridge along 10th Avenue NE. The visual boundary is generally somewhat narrower and defined by mature trees that block views.

The western boundary is generally the topographic ridge along Corliss Avenue North about a half mile from I-5. The visual boundary is generally much narrower and is defined by mature trees that block views.

Viewshed 2 includes a single-family residential area on both side of I-5. There are a few churches and institutional uses in the area and a park on the west side of the freeway extending from NE 125th Street to NE 130th Street.

Visual Character

I-5 is 350 feet to 450 feet wide in Viewshed 2, with interchange and a collector-distributor lane on the east side equivalent to 10 lanes with no median. The highway exhibits a prevalence of built environment features, with noise walls on both sides and little landscaping and vegetation south of NE 130th Street. The visual character is dominated by the linear character of the horizontal travel lanes and the linear character of continuous noise walls, both of which have similar and consistent texture and color. The highway is framed by managed vegetation behind the noise walls, but the greater complexity of texture and color is a minor element because of the visual dominance of the framing noise walls.

The visual character of the residential areas on both sides of I-5 is provided by the similar character and design of small single-family residences on lots with lawn and landscaped areas. Large evergreen trees provide the dominate color and texture of distant views and are the dominant element above the roofline of residences. Streets have a consistent character from framing residences and landscaping. I-5 is not visible from most neighborhoods in Viewshed 2 because views are blocked by intervening buildings and landscaping. Views from within a residential block of I-5 are generally screened by a combination of topography, vegetation, and noise walls. Noise walls vary in their visual prominence when viewed from adjacent neighborhoods, largely due to the extent of vegetation on the residential side of the walls, which is generally substantial. I-5 is not visible as an encroaching element from surrounding neighborhoods.

Viewer Sensitivity

Residents of the single-family residential neighborhood on the east side of I-5 in Viewshed 2 and users of parks and churches are likely to be highly sensitive to changes in the visual context. Drivers and occupants of about 200,000 vehicles per day who travel through this viewshed on I-5 are likely to be of average sensitivity.

Visual Quality

The visual quality of I-5 south of 130th Street is low due to encroachment of noise walls and lack of intactness due to the low presence of vegetation between the noise walls and highway. There are no features that are distinctive or memorable in views available to vehicle occupants.

The visual quality of the surrounding neighborhoods is medium to high because of the compositional harmony of the similar-scale buildings and moderately dense landscaping that results in a similar street-level character over most of the viewshed. The visual quality looking towards I-5 from the neighborhood is composed of consistent scale and character of structures and vegetation. Vegetation and noise walls limit views towards the highway while providing a consistent background character.

The visual character of Viewshed 2 is shown in photographs of Viewpoint 4 at NE 113th Street and 3rd Avenue NE, Viewpoint 5 at the church at 3rd Avenue NE north of NE 117th Street, Viewpoint 6 at NE 124th Street east of 5th Avenue NE, Viewpoint 7 on 5th Avenue at NE 125th Street and Viewpoint 8 at Roosevelt Way NE (NE 130th Street) east of 5th Avenue NE.

1.2.3 Viewshed 3: NE 133rd Street to NE 152nd Street

The Viewshed 3 northern boundary is defined by a transition in topography as I-5 transitions from a downslope to a level section. The eastern viewshed boundary is the topographic ridge that extends to the northeast from 10th Avenue NE to near 4th Avenue NE near NE 145th Street. The western boundary is generally the topographic ridge along Burke Avenue North about a half mile from I-5. The visual boundary on both sides is generally much narrower and is defined by mature trees that block views.

Viewshed 3 includes the City of Seattle's Jackson Park Golf Course on the east side of I-5 and a single-family residential area and a private school campus on the west side. Views of I-5 are available from the fairways in the westerly portion of the golf course but are obscured in many areas by heavy vegetation between the I-5 travel lanes and 5th Avenue NE and between this arterial and the golf fairways. Views from the residential area on the west side of I-5 are currently excluded from most residences and residential streets by continuous noise walls and dense vegetation,

except for some higher elevation residences. Views from residences north of NE 145th Street and east of I-5 are blocked by noise walls. Views down streets perpendicular to I-5 include views over the noise walls near 5th Avenue NE, where topography is higher.

Visual Character

In Viewshed 3, I-5 has eight travel lanes, except at the NE 145th Street interchange. The highway is generally above the adjacent grade on the east side and below the adjacent grade on the west side. The central visual element for vehicle occupants is the linear character of the horizontal travel lanes with consistent texture and color. The view terminates to the north with a skyline characterized by the distant color and texture of evergreen trees in the distance. For southbound traffic on I-5, the view approaching the NE 145th Street overpass includes the distant vivid element of snow-capped Mount Rainier, which rises in contrast to the distant color and texture of evergreen trees on the remainder of the skyline. South of NE 143rd Street, the view terminates at the topographic rise near NE 130th Street, with treetops the dominant feature of the distant skyline. The downtown Seattle skyline is not visible in any views to the south from I-5 in Viewshed 3.

The dominant landscape feature is the Jackson Park Golf Course to the east, with elements of vivid green in fairway areas framed by dark green stands of mature evergreens. The land cover immediately east of I-5 is a mix of deciduous trees, which provides a diversity of color and texture in all seasons. Land cover to the west is a homogeneous dark green of mature evergreen tree cover rising on a hill, with little or no views of roofs or other features of the residential neighborhood.

Golfers at Jackson Park Golf Course view a landscape dominated by the color and texture of heavy evergreen vegetation in the middle distance on the facing hill to the west. The near views of the golf course are of the connected features of horizontal elements of grass turf on fairways separated by bands of mature evergreen trees. I-5 at the base of the hill to the west is largely not an element of views because of screening by mature vegetation.

The visual character of the residential areas on the west side of I-5 is dominated by b large evergreen trees on individual lots and by mature vegetation adjacent to I-5. Residential streetscapes have a consistent character because they are framed by residences and landscaping. I-5 is not visible from most neighborhoods in Viewshed 3 because views are blocked by intervening buildings and mature trees. Noise walls vary in their visual prominence when viewed from the back yards of adjacent single-family houses.

Viewer Sensitivity

Golfers at Jackson Park Golf Course are likely to be highly sensitive to changes in the landscape because these viewers are engaged in a recreational use in an area with high visual amenities. Residents of the single-family residential neighborhood on the west side of I-5 are also likely to be highly sensitive to changes in the visual context. Drivers and occupants of about 200,000 vehicles per day who travel through Viewshed 3 on I-5 are likely to be of average sensitivity.

Visual Quality

The visual quality of Jackson Park Golf Course is medium to high. The golf course has a unity and compositional harmony of a landscaped setting and is buffered from views of encroaching features such as I-5 by mature vegetation. There are no vivid features visible. Residential areas are of medium visual quality because of the similar character of the residential neighborhood with similar building scale and moderately dense landscaping that provides a similar street-level character with I-5 visible from higher topography. The visual character of I-5 is medium because dense vegetation frames both sides I-5. The view from southbound vehicles on I-5 from NE 155th Street to NE 145th Street includes Mount Rainier as a distinctive and memorable element in the distance. This short stretch of highway has medium visual quality because of that view and framing vegetation; however, this view lasts for only for a few minutes of travel and the context of the view is the travel lanes of the highway. Intermittent views of Mount Rainier and other Cascade Mountain peaks are available to travelers on I-5 through much of Washington and Oregon.

The visual character of Viewshed 3 is shown in photographs of Viewpoint 10 from Jackson Park Golf Course, Viewpoint 11 from I-5 northbound at NE 143rd Street, Viewpoint 12 from 5th Avenue NE at NE 145th Street, Viewpoint 13 from North 145th Street at 4th Avenue North, Viewpoint 14 from NE 148th Street west, Viewpoint 16 from 5th Avenue NE at NE 149th Street, and Viewpoint 17 from I-5 southbound at NE 148th Street.

1.2.4 Viewshed 4: NE 152nd to NE 178rd Street

Viewshed 4 encompasses a portion of the I-5 corridor within the city of Shoreline generally characterized by a slope to the east and more level topography on the west. The northern boundary of this viewshed represents a change in highway character from one dominated by vegetation to a greater dominance of noise walls.

The eastern boundary of this viewshed east of I-5 is a single-family residential area largely on a slope above the highway, with the 3.6-acre Ridgecrest Park at NE 162nd Street adjacent to the highway. The western boundary of Viewshed 4 west of I-5 and largely below the grade of I-5 travel lanes consists of a single-family residential area with Twin Ponds Park south of NE 155th Street, the King County Metro Transit

North Base and King County Transfer Facility between North 163rd Street and North 167th Street, James Keough Park between North 163rd Street and North 167th Street, and Ronald Bog Park south of NE 175th Street. None of these parks has views of I-5 travel lanes because of topography, noise walls, and vegetation. An approximately 0.5-acre WSDOT "beautification area" is at the southeast corner of the NE 175th Street interchange. A 1-acre "beautification area" is located across the highway at the northwest corner of the interchange.

Visual Character

I-5 is 150 feet to 200 feet wide in Viewshed 4, with eight travel lanes except at the NE 175th Street Interchange and the access to the transit base. The visual character is dominated by the linear character of horizontal travel lanes, with consistent texture and color. The highway is framed by heavy mature evergreen vegetation on both sides, except at the King County Transfer Facility, which provides a contrasting natural element.

The visual character of the residential areas on both sides of I-5 is consistent from the residences and landscaping. I-5 is not visible from neighborhoods to the east because views are blocked by intervening buildings and mature trees. Ridgecrest Park at NE 162nd Street on the east side of the highway is screened by a berm and a row of large deciduous trees. On the west side of I-5, most of the project corridor is below the elevation of the travel lanes.

Viewer Sensitivity

Viewers of the landscape in Viewshed 4 consist of residents of the single-family residential neighborhoods on both sides of I-5, who are highly sensitive to changes in the visual context. Park users are also considered highly sensitive to changes they can observe. Drivers and occupants of about 200,000 vehicles per day who travel through the viewshed on I-5 are likely to be of average sensitivity.

Visual Quality

The visual quality of I-5 is medium because of the dense vegetation that frames the highway on both sides, but I-5 has no vivid features in Viewshed 4. Visual quality of the residential area is medium because of the unity provided by the homogeneous character of similar building scale and moderately dense landscaping, which provide a similar street-level character. The residential area in this viewshed has no features that are vivid, distinctive, or memorable. Direct views of I-5 are not available except for overhead signage. Noise from I-5 is, however, a constant reminder of its presence. The extent to which the I-5 corridor is a visual intrusion is reduced by topography, vegetation buffers, and noise walls and does not displace the unity of

the surrounding neighborhoods. These features provide a moderate level of fit between I-5 and the elements of the surrounding residential neighborhood.

The visual character of Viewshed 4 is shown in photographs of Viewpoint 18 and 19 at NE 155th Street west of 3rd Avenue NE, Viewpoint 20 at 1st Avenue NE south of NE 159th Street, and Viewpoints 21 and 22 at Ridgecrest Park.

1.2.5 Viewshed 5: NE 178rd Street to NE 190th Street

The northern boundary of Viewshed 5 is a transition between a relatively level highway grade and a downslope beginning at about NE 190th Street. The viewshed is bounded by topography, but the main distinguishing feature is the prominence of noise walls on both sides of the highway, which are more prominent at the top of a cut slope on the west side.

Single-family residential use is present on both sides of I-5 in this viewshed. There are a few churches, cemeteries, and institutional uses in the area. On the west side of I-5 between North 185th Street and North 190th Street are the Shoreline School District administrative offices, conference center, and stadium. An approximately 0.5-acre beautification area is on the east side of I-5 south of NE 180th Street. Also east of I-5 in Viewshed 5 is a parcel owned by Seattle City Light for a transmission line corridor that accommodates a water pump station. Residential areas in this viewshed do not currently have views of I-5 due to noise walls.

Visual Character

I-5 is about 160 feet wide in Viewshed 5, with eight lanes. The visual character is dominated by the linear features of the horizontal travel lanes. The highway is bounded by noise walls set back from travel lanes on the west side by an intervening cut slope with little mature vegetation. On the east side of I-5, there are noise walls close to travel lanes through most of the corridor, with little or no intervening vegetation. Visual character is dominated by manmade features. There are no vivid features in views.

The visual character of the residential areas on both sides of I-5 is defined by the similar character and design of small single-family residences on lots with lawn and landscaped areas. Large evergreen trees provide the dominant color and texture of distant views and are the dominant element above the roofline of residences. Streets have a consistent character from the residences and landscaping that frame the arterials. I-5 is not visible from most neighborhoods because views are blocked by intervening buildings and landscaping. The Shoreline School District administrative offices, conference center, and stadium on the west side of I-5 provide a contrasting character, with the scale of the stadium dominating near views. The Seattle City Light transmission line corridor on the east side of I-5 is prominent because of its tall metal lattice towers north of NE 185th Street on a corridor that cuts diagonally

through the neighborhood; the transmission line corridor is less prominent to the south, where it transitions to two sets of wooden poles along streets. Views of I-5 from residential neighborhoods are generally screened by a combination of topography, vegetation, and noise walls, which reduces the highways visual intrusion and provides a moderate level of fit with the surrounding residential neighborhoods.

Viewer Sensitivity

Drivers and occupants of about 200,000 vehicles per day who travel through Viewshed 5 on I-5 are likely to be of average sensitivity. Residents of the single-family residential neighborhoods on both sides of the highway are likely to be highly sensitive to changes in the visual context. Persons viewing games at the Shoreline Stadium are likely to have a low level of sensitivity because of their focus on game activities.

Visual Quality

The visual quality of I-5 in Viewshed 5 is low to medium because of the noise walls on both sides that frame the highway, although the setback on the west side reduces the noise walls' visual prominence. The visual quality of the residential area is medium due to the homogeneous character of the residential neighborhood, which has similar building scale and moderately dense landscaping that provide a similar street-level character. The Shoreline Stadium is a visual encroachment in the immediate vicinity on the west side of I-5. The Seattle City Light transmission line corridor is a visual intrusion for nearby viewers. The extent to which the I-5 corridor is a visual intrusion is reduced by topography, vegetation buffers, and noise walls, which maintains the consistent scale and character of structures and vegetation in the adjacent residential neighborhoods. There are no vivid features in any views.

The current visual character of Viewshed 5 is shown in photographs of Viewpoint 23 from I-5 northbound at NE 183th Street, Viewpoint 24 of the Seattle City Light transmission line corridor from NE 185th Street east of 8th Avenue NE, Viewpoint 25 at NE 185th Street west of 8th Avenue NE, Viewpoint 26 at NE 185th Street west of 5th Avenue NE, Viewpoint 27 at NE 185th Street looking west from near 5th Avenue NE, Viewpoint 28 from 5th Avenue NE (west of I-5) north of NE 185th Street, and Viewpoint 29 of I-5 southbound at NE 187th Street.

1.3 Segment B Viewsheds

1.3.1 Viewshed 6: NE 190th Street to NE 205th Street (244th Street SW, SR 104)

Viewshed 6 is on the south side of a topographic valley occupied by McAleer Creek. I-5 is in a downgrade characterized by steep topography on both sides.

A predominantly single-family residential area occupies both side of I-5 in this viewshed. There are a few churches, cemeteries, and institutional uses in the area. On the east side of I-5 between NE 190th Street and NE 193th Street, the North City Park and the closed North City Elementary School bound about 1,000 feet of the right-of-way. A 100-foot-wide Beautification Area is located between the highway right-of-way and the park and school property.

Visual Character

I-5 is about 160 feet wide in this viewshed, with eight lanes. The linear features of the highway are bounded by heavy vegetation. There are noise walls on both sides of I-5, but they are not visible from the highway because they are set back from the shoulder with dense vegetation. The view to the north terminates with the distant color and texture of evergreen trees on a slope, with the distinctive silhouette of treetops at the skyline. There is a high level of coherence and compositional harmony between linear elements of I-5 and the surrounding heavily vegetated landscape.

The visual character of the residential areas on both sides of I-5 is provided by the similarity of single-family residences and stands of large evergreen trees throughout the area that provide the dominant visual element. Views of the highway from the residences are screened by a combination of topography, vegetation, and noise walls, which reduces I-5's visual intrusion and provides a moderate level of fit with the surrounding residential neighborhoods.

Viewer Sensitivity

Drivers and occupants of about 180,000 vehicles per day who travel through Viewshed 6 on I-5 are likely to be of average sensitivity. Residents of the single-family neighborhoods on both sides of the highway can be considered to be highly sensitive to changes in the visual context.

Visual Quality

The high visual quality of I-5 in Viewshed 6 can be attributed to the highway being framed by very dense mature vegetation on both sides. The visual quality of the residential area is medium because of the homogeneous character of the residential neighborhood, with similar building scale and moderately dense landscaping that provide a similar street-level character. Topography and heavy vegetation limit the extent to which I-5 is a visual encroachment into the unity of the neighborhood.

The current visual character of Viewshed 6 is shown in a photograph of Viewpoint 30 from I-5 northbound at NE 195th Street.

1.3.2 Viewshed 7: NE 205th Street (244th Street SW) to Mountlake Transit Center (233rd Street SW)

Viewshed 7 includes the broad bottom of the topographic valley occupied by McAleer Creek. I-5 is in a gentle upgrade to the north, and the viewshed is bounded at the north by the transition to a heavily vegetated narrow valley.

On the east side of I-5 adjacent to NE 205th Street, 244th Street SW is a commercial and office area separated from I-5 by a dense tree cover along McAleer Creek. North of the commercial area, a former school site is bounded by less dense, primarily deciduous trees. A single-family residential neighborhood east of the commercial area is screened by trees on a steep slope. The Mountlake Terrace Transit Center is at the north end of the viewshed. On the east side of I-5 is a residential area screened by trees on a steep slope. The Nile Golf Course on the west side of I-5 is below the grade of I-5 except at its northeast corner.

Visual Character

I-5 is about 300 feet wide in the southern part of Viewshed 7 with collector/distributor lanes on both sides and widens to about 1,100 feet at the 244th Street SW interchange and narrows a bit to about 700 feet at the 236th Street SW interchange to the north. The visual character is dominated by the linear character of the broad expanse of horizontal travel lanes, with complexity provided by multiple ramps. At the northern boundary of Viewshed 7, the Mountlake Terrace Transit Center has a large parking garage that contrasts in shape and scale with the linear features of the highway. South of the transit center, a multistory office building on the east side of I-5 also provides a contrast to the features of the highway.

The commercial area to the east of I-5 has similar scale and design of buildings and some continuity in parking and landscape features. Views of I-5 are screened by the large trees in the McAleer Creek riparian corridor

The visual character of the Mountlake Terrace Transit Center is dominated by the parking structure and parking lots, although it is surrounded by heavy vegetation.

West of I-5, the Nile Golf Course has continuity and integration of natural features in fairways separated by stands of mature evergreen trees. I-5 is not visible except at the far northeast corner of the golf course, where the highway is a minor element in an expansive view.

Residences and landscaping provide a consistent visual character in the residential areas on the east side of I-5, which is not visible because of distance and heavy vegetation on the steep slope separating the residential neighborhood from the commercial area below.

Drivers and occupants of about 180,000 vehicles per day who travel through Viewshed 7 on I-5 are likely to be of average sensitivity, as are users of the commercial area and offices to the east. Players on the Nile Golf Course and residents are likely to have high sensitivity to the visual environment but have few views of the highway.

Visual Quality

The visual quality of I-5 in Viewshed 7 is medium. The highway has very wide travel lanes because of collector-distributor lanes on each side, but it has a consistent character due to vegetation framing the highway on both sides and heavily vegetated hillsides at the horizon along the direction of movement both north and south. The visual quality of the commercial area to the east is likely to be low to medium due to the similar character of built elements. The Nile Golf Course and residential areas have high visual quality because of the homogeneous character and lack of intrusion of I-5 due to topography and vegetation.

The current visual character of Viewshed 7 is shown in photographs of Viewpoint 31 from I-5 northbound at 240th Street SE and of Viewpoint 32 at 236th Street SW.

1.3.3 Viewshed 8: 233rd Street SW to 220th Street SW

Viewshed 8 is a distinctive stretch of I-5 characterized by the narrow valley it traverses, with high steep slopes and very heavy mature evergreen tree cover.

Viewshed 8 includes predominantly single-family residential use on both sides of I-5 at the top of steep slopes up to 80 feet high, with densely vegetated areas between 50 feet and 200 feet wide. Residential areas in this viewshed have no views of I-5 because of noise walls and vegetation, except for residences on 227th Street SW, which is at an elevation close to I-5. Noise walls separate the residences from views of I-5. A beautification area extends along the west side of the right-of-way from about 233rd Street SW to just south of 228th Street SW at the top of the densely vegetated slope.

Visual Character

I-5 is about 200 feet wide in Viewshed 8, with eight lanes and a median 40 feet to 50 feet wide. The highway is bounded by very dense vegetation on high steep slopes on either side. There is dense evergreen trees cover from north of 236th Street SW to the off-ramps at 220th Street SW. A road overcrossing at 228th/230th Streets SW crosses I-5 and traverses the slope. South of 225th Street SW, the tree cover on the east side of I-5 is up to 100 feet high and 100 to 250 feet wide. The tree cover on the west side of I-5 is up to 80 feet high and about 2,000 feet wide south of 227th Street SW. The tree cover between 227th Street SW and 222nd Street SW ranges from 80 to 20 feet high and 50 to 200 feet wide, with a short noise wall near the bottom of

the slope that is visible from I- 5. 227th Street SW is at a similar elevation as I-5 because it is located in a former stream ravine. There are noise walls on both sides of I-5, but they are not visible from the highway because they are near the top of a slope and screened by heavy vegetation. On the west side of I 5 from about 233rd Street SW to just south of 228th Street SW, a highway beautification area extends along the top of a densely vegetated slope.

The view to the north ends with distinctive silhouette of evergreen trees adjacent to I-5 due to the curve of the highway. The heavy vegetation on both sides is the dominant visual element because of the height of the vegetated slope and the density and maturity of the trees. There is a high level of coherence and compositional harmony between linear elements of the highway and the surrounding, heavily vegetated landscape.

The visual character of the residential areas on both sides of I-5 in this viewshed is provided by the similar character of single-family residences. There are no views of the highway because of noise walls, tree cover, and slopes. I-5 is not a visual intrusion, although the residences on 227th Street SW are in a valley with noise walls that partly screen views of I-5.

Viewer Sensitivity

Drivers and occupants of about 180,000 vehicles per day who travel through Viewshed 8 on I-5 are likely to be of average sensitivity. Residents of the single-family neighborhoods on both sides of the highway would be highly sensitive to changes in the visual context.

Visual Quality

The visual quality of views from I-5 in Viewshed 8 has high visual integrity and unity because the highway is framed by very dense mature vegetation on both sides. The almost complete enclosure of this segment of I-5 by heavy vegetation on both sides of a ravine provides near and near-middle view elements that are distinctive and memorable, although of short duration, particularly for southbound vehicles. For northbound vehicles south of 232nd Street SW, visual quality is medium rather than high because of the encroachment of roadway crossings and the pedestrian overpass to the existing median transit stop. Visual quality of the residential area is medium due to the homogeneous character of the residential neighborhood, which has similar building scale and moderately dense landscaping that provides a similar street-level character.

The current visual character of Viewshed 8 is shown in photographs of Viewpoint 33 from I-5 northbound at 232nd Street SW, Viewpoint 34 from I-5 southbound at 232nd Street SW, Viewpoint 35 from I-5 southbound at 230th Street SW, Viewpoint

36 from the 230th Street SW Overpass, Viewpoint 37 from 222nd Street east of 64th Avenue West, and Viewpoint 38 at 222nd Street SW.

1.3.4 Viewshed 9: 220th Street SW to 212th Street SW

Viewshed 9 includes the almost level section of I-5 oriented southwest-to-northeast south of where the light rail alignment would transition off the I-5 corridor to the west.

Viewshed 9 includes predominantly single-family residential uses on both sides of I-5, generally below the elevation of the highway, except near 212th Street SW. There is moderate to dense vegetation within the right-of-way, with noise walls adjacent to residential uses. On the west side of I-5, there are office buildings between 220th Street SW and 219th Street SW and a multifamily complex between 219th Street SW and 216th Street SW.

Visual Character

I-5 is about 220 feet wide in Viewshed 9, with eight lanes and a median 40 feet to 60 feet wide. The highway is bounded by moderate-to-dense mature vegetation on both sides. Noise walls, where present, are set back from the roadway, buffered by vegetation, and not visible from vehicles. Northbound vehicle occupants on I-5 north of 216th Street SW have views of Mount Pilchuck, Three Fingers, and Whitehorse Mountain peaks in the distance. They are vivid distant features, particularly when snowcapped during the winter and spring.

The visual character of the residential areas on both sides of I-5 is provided by the similar character of single-family residences. There are no views of the highway because of noise walls, tree cover, and slopes. I-5 is not a visual intrusion.

Viewer Sensitivity

Viewers of the landscape in Viewshed 9 consist of residents of the single-family residential neighborhoods on both sides of I-5, who can be considered highly sensitive to changes in the visual context. There are, however, no current views of the highway because of noise walls and vegetation. Office and commercial areas on the west side of I-5 have low to average viewer sensitivity. Drivers and occupants of about 200,000 vehicles per day who travel through this viewshed on I-5 are likely to be of average sensitivity.

Visual Quality

The majority of I-5 in Viewshed 9 is bordered by dense, mature, native vegetation, which provides a sense of enclosure and a moderate level of fit between elements of the highway and the vegetation border. This results in a moderate level of coherent and compositional harmony for viewers on I-5. Visual quality is medium and reflects the integrity and unity provided by framing vegetation. Viewshed 9 is not considered

to have high visual quality because, although the mountain peaks are distinctive and memorable elements, the view lasts for only for a few minutes. Intermittent views of Cascade Mountain peaks, including Mount Baker, are available to travelers on I-5 northbound for many miles.

Visual quality of the residential area in Viewshed 9 is likely to be medium because the homogeneous character of the residential neighborhood, which has similar building scale and moderately dense landscaping that provides a similar street-level character. The visual quality of the office and commercial area to the west is low to medium due to the similar character of built elements, landscaping, and street character.

The current visual character of Viewshed 9 is shown in photographs of Viewpoint 39 from I-5 northbound at 212th Street SW.

1.4 Segment C Viewshed

1.4.1 Viewshed 10: 212th Street SW to 40th Avenue West

Viewshed 10 includes several landscape units, which are described below and then characterized by visual quality and character in the subsequent subsection.

- Landscape Unit 1 – I-5 northbound between 212th Street SW and 52nd Avenue West in Lynnwood is bounded by a single-family residential neighborhood, including the privately owned Hall Lake and a 10-acre open space area that has been used as a summer camp. Five residences and a church are adjacent to I-5. The land north of I-5 varies from 30 feet to 40 feet below the elevation of the travel lanes. A densely vegetated area with mature evergreen and deciduous trees about 50 feet to 70 feet wide is within the right-of-way on steep fill slopes. The current visual character is shown in photographs of Viewpoint 40 from Hall Lake. The current character of I-5 is shown by Viewpoint 41 from I-5 southbound at 50th Avenue West.
- Landscape Unit 2 – Along 52nd Avenue West on the west side is a single-family residential neighborhood from I-5 to 203rd Street SW. West of 52nd Avenue West is a single-family residential area. To the west along Cedar Valley Road is an office complex on a small lake. East of 52nd Avenue West and Cedar Valley Road is a commercial and light industrial area extending to Scriber Creek Park. The current visual character is shown in photographs of Viewpoint 42 from 52nd Avenue at 208th Street SW.
- Landscape Unit 3 – Scriber Creek Park is on the west side of Cedar Valley Road from 201st Street SW and 200th Street SW. This park encompasses lawn area, wetlands along Scriber Creek, and trails. The current visual character is shown in photographs of Viewpoint 43.
- Landscape Unit 4 – Along 200th Street SW from Cedar Valley Road to 44th Avenue West are a multifamily development on the north side to 46th Avenue West and a small shopping center between 46th and 44th Avenues West. The south side of 200th Street SW has multifamily development from

50th to 48th Avenues West, office development from 48th to 46th Avenues West, and commercial development from 46th to 44th Avenues West. The multifamily areas have a consistent streetscape, with street trees and either parking lot landscaping or front yard lawns. The current visual character is shown in photographs of Viewpoint 44 of 50th Avenue West from 200th Street SW and Viewpoint 45 of 200th Street SW from 49th Avenue West.

- Landscape Unit 5 – South of 200th Street SW, the Lynnwood Transit Center is on a 29-acre site, with bus loading facilities located between 48th and 46th Avenues West south of 202nd Street SW, and 1,368 parking spaces. There is a transit-only overpass connecting to the center high-occupancy vehicle (HOV) lanes on I-5. The parking lots have moderately dense landscaping.
- Landscape Unit 6 – A large tract east of the Lynnwood Transit Center consists of wetlands along Scriber Creek with heavy vegetation, including mature deciduous trees. The current visual character is shown in photographs of Viewpoint 46, the existing trail from Scriber Creek Park and Viewpoint 47 from the transit center.
- Landscape Unit 7 – The Interurban Trail between 52nd Avenue West and the Lynnwood Transit Center is bounded by moderate to dense vegetation on both sides except adjacent to the transit center, where one side of the trail is adjacent to parking lots. The current visual character is shown in photographs of Viewpoint 48 from the trail at 48th Avenue West and Viewpoint 51 from 44th Avenue West.
- Landscape Unit 8 – The 44th Avenue West corridor south of 200th Street SW includes commercial development and the Lynnwood Transit Center on the west side and commercial development on the east side. The area is characterized by wide streets, parking lots, and strip malls. The current visual character is shown in photographs of Viewpoint 49 and 50 of 44th Avenue West from south and north of 200th Street SW.

Visual Character and Visual Quality

Visual character and quality differs within the Viewshed 10 landscape units.

- Landscape Unit 1 – I-5 northbound from the curve at about 215th Street SW is aligned with distant views of Mount Pilchuck, Three Fingers, and Whitehorse Mountain in the distance. These peaks are vivid distant features, particularly when snowcapped. The highway is bounded by moderate-to-dense, mature vegetation on both sides. Visual quality is medium, which reflects the integrity and unity provided by framing vegetation. I-5 in this landscape unit is not considered to have a high visual quality because, although the mountain peaks are distinctive and memorable elements, the view lasts for only for a few minutes. Intermittent views of Cascade peaks, including Mount Baker, are available to travelers on I-5 northbound for many miles. Visual quality of the residential area is likely to be medium due to the homogeneous character of the residential neighborhood, which has similar building scale and moderately dense landscaping that provides a

similar street-level character. The current visual character of this Viewshed 10 landscape unit is shown in photographs of Viewpoint 31 from I-5 northbound at 212th Street SW and Viewpoint 33 from I-5 southbound at 50th Avenue West.

- Landscape Unit 2 – The single-family residential neighborhood along I-5 between 212th Street SW and 52nd Avenue West, including residences and a large open-space tract adjacent to the highway, is separated from I-5 by dense, mature vegetation. Visual quality of this Viewshed 10 landscape unit is medium due to the open space area and mature vegetation. The current visual character of this area is shown in a photograph of Viewpoint 32 from the residential area adjacent to Hall Lake.
- Landscape Unit 2 – The residential neighborhood on the west side of 52nd Avenue West west of I-5 has medium visual quality due to a unity of features. The industrial uses north of 52nd Avenue West are not a visual intrusion because of the low profile of buildings and landscaping and parking areas adjacent to the street. The current visual character of this landscape unit is illustrated by a photograph of Viewpoint 34 from 52nd Avenue West at 208th Street SW.
- Landscape Unit 3 – Scriber Creek Park on the east side of Cedar Valley Road approaching 200th Street SW has high visual quality due to the mix of lawn, wetlands, and trails and the unifying, homogeneous, dense vegetation throughout that also buffers the park from the street and adjacent urban development. The current visual character of this landscape unit is illustrated by photographs of Viewpoints 35 and 38 from within Scriber Creek Park and Viewpoint 36 outside of the park at 50th Avenue West and 200th Street SW and Viewpoint 39 from the Lynnwood Transit Center.
- Landscape Unit 4 – The areas on both sides of 200th Street SW west of Cedar Valley Road include multifamily buildings and offices, transitioning to commercial uses east of 46th Avenue West. The multifamily residential neighborhood has medium visual quality due to a unity of bulk, design, and landscaping that provides compatible features. The commercial areas north of industrial uses north of 46th Avenue West have low visual quality due to the variety of building forms, the lack of visual harmony among a variety of building styles, and other features. The current visual character of this landscape unit is illustrated by a photograph of Viewpoint 37 from 200th Street SW at 49th Avenue West.
- Landscape Unit 5 – The Lynnwood Transit Center occupies a 29-acre site with several large park-and-ride areas. The transit center is bounded on the west by a large tract with wetlands and Scriber Creek. Visual quality of the transit center is low due to the predominance of parking lots, despite landscaping and the adjacent open space area.
- Landscape Unit 6 – Scriber Creek wetland and the Interurban Trail occupies this area between the Lynnwood Transit Center, Scriber Creek Park, 52nd Avenue West, and generally I-5. The area includes both natural views of the

wetlands to the northwest of the Interurban Trail, and the trail itself is developed on Snohomish County PUD's major transmission corridor; large towers and overhead lines are part of the landscape. Industrial properties are to the south and east of the landscape unit, and commercial/light industrial buildings, the transit center, direct access ramps and a pump station are on its various edges. The visual quality for viewers is moderate because the natural views are interrupted by these other built features. The current visual character of this landscape unit is illustrated by photographs of Viewpoints 41, 42, and 43.

- Landscape Unit 7 – The Interurban Trail crosses 52nd Avenue West and runs northeast toward the Lynnwood Transit Center, with the Scriber Creek wetlands and the transit center to the north, before it continues northward to cross 44th Avenue West on an overpass near I-5. The trail is bounded by moderate-to-dense vegetation and has a medium visual quality due to the unity of the vegetation cover along the corridor. The current visual character of the area east of the transit center is illustrated by a photograph of Viewpoint 40 from the Interurban Trail at 48th Avenue West. The current visual character of the bridge crossing over 44th Avenue West is illustrated by a photograph of Viewpoint 42.
- Landscape Unit 8 – The 44th Avenue West corridor south of 200th Street SW includes commercial development and the Lynnwood Transit Center on the south side and a variety of commercial development on the north side. The dominant visual image is wide streets, large parking lots, signs, and strip malls. The visual quality for viewers within the commercial area is medium to low due to lack of unity. The visual quality for occupants of vehicles traveling north on the arterial is generally low because of the multiple overcrossings by I-5 and the Interurban Trail, freeway on-ramps, adjacent parking lots, signs, and strip malls with little visual interest. The current visual character of this landscape unit is illustrated by a photograph of Viewpoint 41 from 44th Avenue West south of 200th Street SW.

Viewer Sensitivity

Viewers of the landscape in Viewshed 10 consist of residents of the single-family and multifamily residential neighborhoods, which are considered to be highly sensitive to changes in the visual context. Workers in industrial areas and shoppers in commercial areas are likely to be of average sensitivity. Drivers and occupants of about 200,000 vehicles per day who travel through the area on I-5 as well as occupants of vehicles on arterials are likely to be of average sensitivity.

APPENDIX I-4.6

Air Quality and Greenhouse Gases

APPENDIX I-4.6 AIR QUALITY AND GREENHOUSE GASES — BACKGROUND INFORMATION

Table I-4.6-1. Air Quality Standards

Pollutant	National primary standard	Washington State and PSCAA regional standard
CO (carbon monoxide)		
1-hour average (not to be exceeded more than once per year)	35 ppm	35 ppm
8-hour average (not to be exceeded more than once per year)	9 ppm	9 ppm
PM_{10}		
24-hour average (not to be exceeded more than once per year on average over 3 years)	150 µg/m^3	150 µg/m^3
$PM_{2.5}$		
Annual (annual mean, averaged over 3 years)	12 µg/m^3	12 µg/m^3
24-hour average concentration (98th percentile averaged over 3 years)	35 µg/m^3	35 µg/m^3
Total suspended particulates		
Annual arithmetic mean	NS	60 µg/m^3
24-hour average concentration (not to be exceeded more than once per year)	NS	150 µg/m^3
O_3 (ozone)		
8-hour average (annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years)	0.075 ppm	0.075 ppm
SO_2 (sulfur dioxide)		
1-hour average (99th percentile of 1-hour daily maximum concentrations, averaged over 3 years)	75 ppb	75 ppb
3-hour average (not to be exceeded more than once per year)	0.5 ppm	0.5 ppm
24-hour average (not to be exceeded more than once per year)	NS	0.14 ppm
Annual average (not to be exceeded)	NS	0.02 ppm
NO_2 (nitrogen dioxide)		
1-hour average (98th percentile averaged over 3 years)	100 ppb	100 ppb
Annual (annual mean)	53 ppb	53 ppb
Pb (lead)		
Rolling 3-month average (not to be exceeded)	0.15 µg/m^3	0.15 µg/m^3

Sources: EPA 2011; Chapter 173-474 WAC (1987)

The 8-hour ozone standard of 0.075 ppm (effective in 2008) replaces (for the most part) the previous 1-hour standard of 0.08 ppm.

µg/m^3 = micrograms per cubic meter; NS = no standard established; ppb = parts per billion; ppm = parts per million

Carbon Monoxide Hot-spot Modeling

For the Final EIS, existing conditions and long-term localized operational impacts for forecast year 2035 under the No Build and Lynnwood Link Extension Preferred Alternative (which is considered representative of the effects of other potential combinations of alternatives in Segments A, B and C) were evaluated using EPA's MOVES2010b to calculate vehicular emission rates, and EPA's CAL3QHC dispersion model to determine worst-case CO concentrations at signalized intersections.

Worst-case CO concentrations were initially calculated for the Draft EIS on a total of nine intersections (three per project segment) with the highest potential CO emissions, and no air quality impacts were found. The analysis was updated for the Final EIS for three of the nine intersections, which reconfirmed the finding of no air quality impacts.

To screen for the intersections with the highest potential emissions, traffic data were used to identify intersections with the highest volume and a LOS of D or worse under the light rail alternatives for forecast year 2035. If the worst-case intersections do not impact air quality, then all other intersections would experience a lesser impact. The screened intersections meeting these criteria underwent a CO hot-spot modeling analysis.

Since the Draft EIS, there have also been some changes in the tools used for calculating air quality conditions. The Draft EIS results were derived from the Washington State Intersection Screening Tool (WASIST) and was based on a series of worst-case scenarios in EPA's MOBILE 6.2 emission factor algorithm and EPA's CAL3QHC mobile source dispersions model. EPA has issued new requirements for air quality modeling using newer EPA's MOVES2010b emission factor algorithm. The Final EIS analysis has been updated using EPA's MOVES2010b emission factor algorithm and EPA's CAL3QHC mobile source dispersion model.

With either method, there are three informational data input categories necessary to perform a complete CO analysis:

1. General inputs. These include the project's general characteristics, such as the project name, intersections name, year of the analysis, and background concentration.
2. Intersection inputs. These include detailed information on the modeled intersection, the intersection layout, peak-hour traffic volumes, approach speed, and signal timing.
3. Receptor inputs. These include more specific information concerning receptors and the distance from the edge of the roadways.

After these informational data inputs are entered, the models calculate the worst-case CO concentrations at the specified intersections (Table I-4.6-2).

The Final EIS worst CO concentrations using EPA's MOVES2010b and EPA's CAL3QHC models were lower than the Draft EIS CO concentrations calculated with conservative WASIST screening (Table I-4.6-3). Because the worst-case intersections do not impact air quality under both the Final EIS and Draft EIS analysis, then all other intersections would experience a lesser impact.

APPENDIX I-4.9

Water Resources

APPENDIX I-4.9 WATER RESOURCES — BACKGROUND INFORMATION

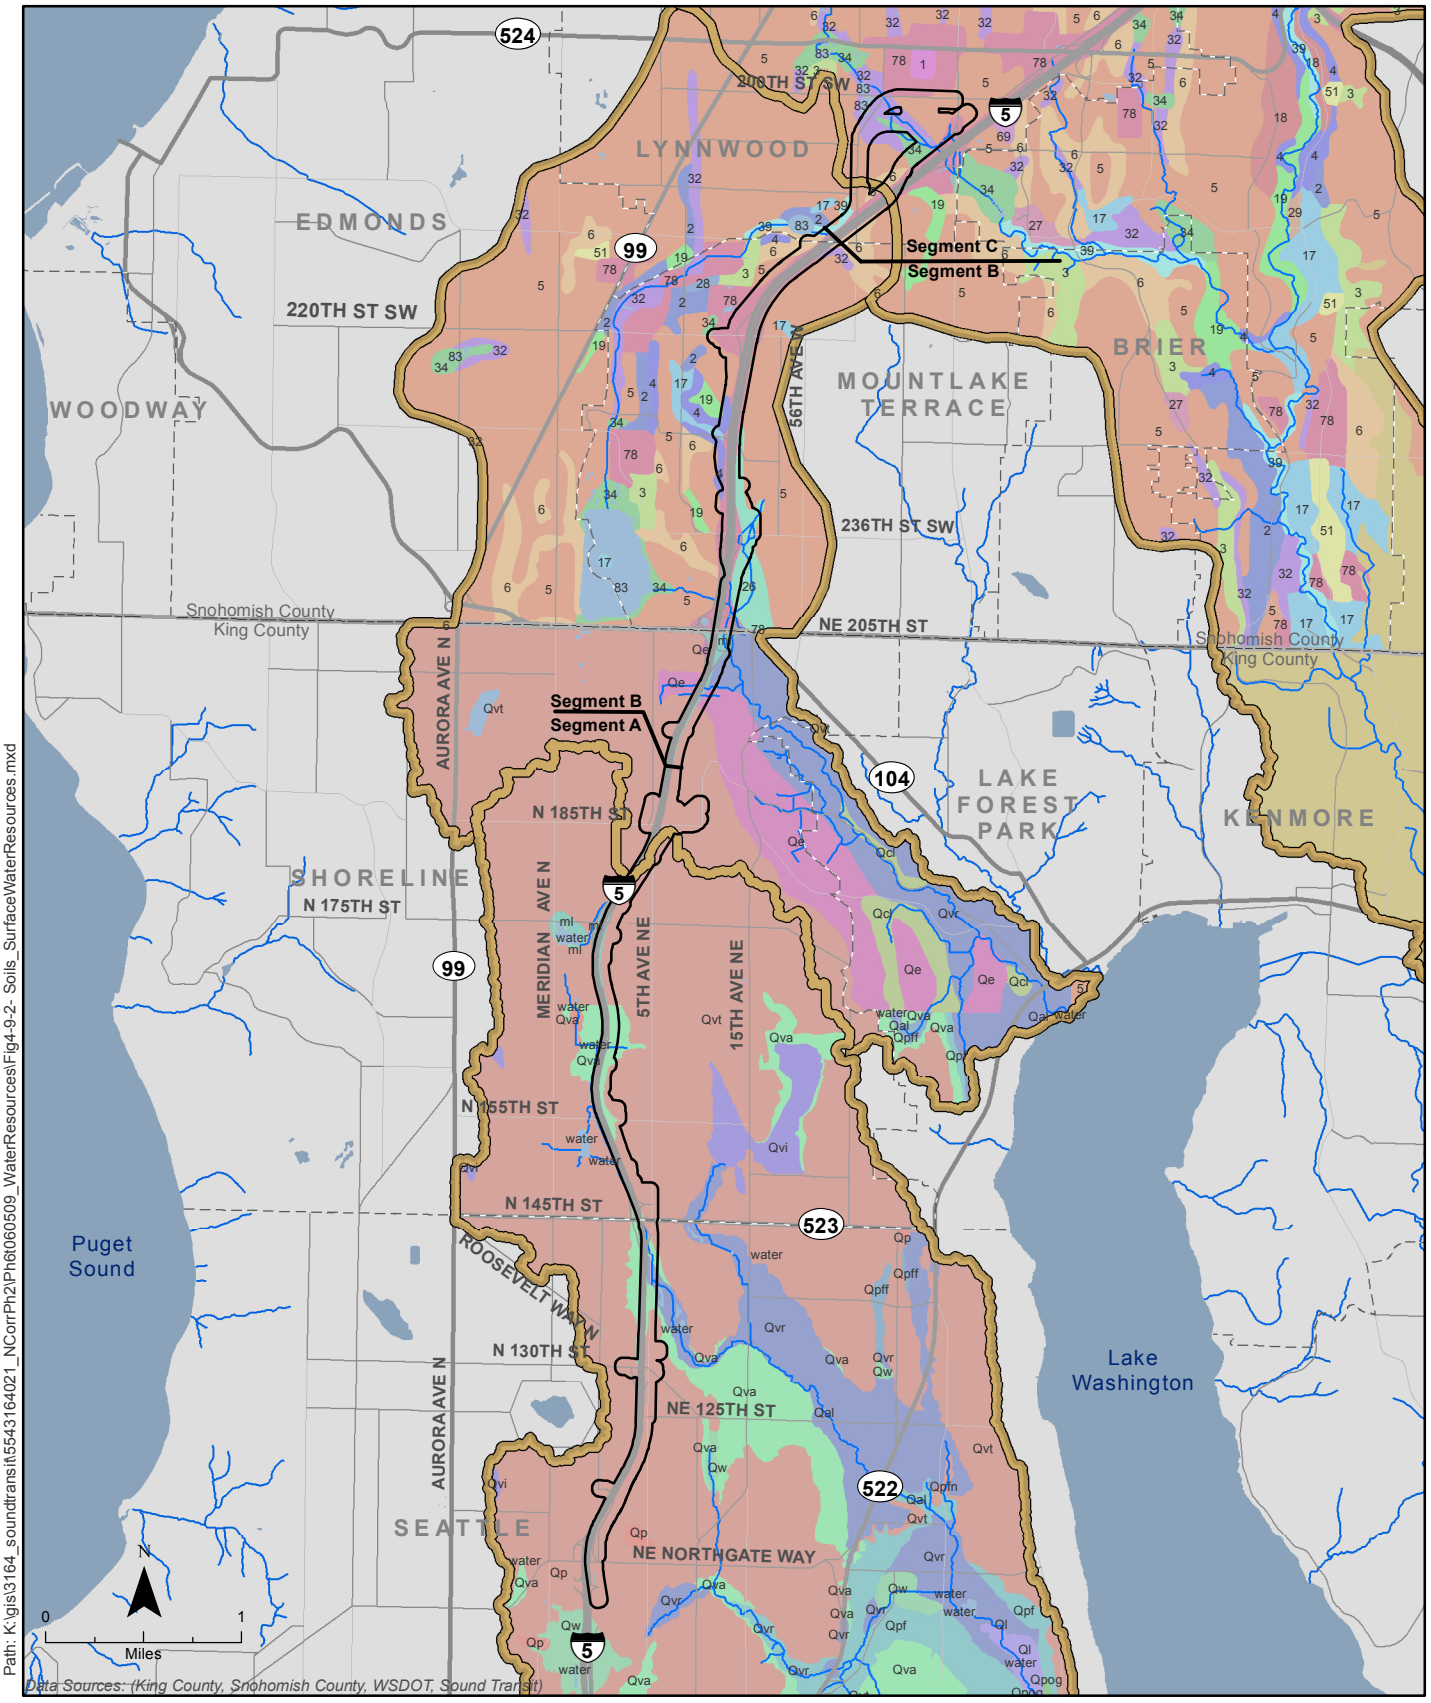
EXISTING STORMWATER FACILITIES

Existing water quality and flow control facilities in the proposed project vicinity include the following:

- NE Northgate Way: A WSDOT stormwater pond is present to the east of I-5 just south of NE Northgate Way.
- North 117th Street: A City of Seattle municipal vault is present west of I-5 and north of North 117th Street.
- North 165th Street: A City of Shoreline municipal vault is present in the parking lot west of I-5.
- NE 170th to NE 175th Street: WSDOT media filter drains and stormwater ponds are present east and west of I-5, and within the I-5 ramp areas.
- NE 185th Street: A WSDOT stormwater pond and a media filter drain are present to the west of I-5 just south of NE 185th Street.
- NE 200th Street: A WSDOT vault is present to the west of I-5 just south of NE 200th Street.
- 205th Street NE/SR 104: A WSDOT stormwater pond is located in the northwest ramp of the I-5 and 205th Street NE/SR 104 interchange. Two City of Mountlake Terrace municipal stormwater vaults are present in the residential development northeast of the interchange.
- 236th Street SW: A WSDOT stormwater pond is adjacent to the southeast ramp of I-5 at 236th Street SW.
- Mountlake Terrace Transit Center: WSDOT media filter drains, stormwater tanks, and stormwater vaults are present on either side of I-5 starting just north of the Mountlake Terrace Transit Center, near 232nd Place SW, north to 220th Street SW.
- 220th Street SW to 212th Street SW: WSDOT media filter drains are present along the I-5 median from about 0.1 mile north of 220th Street SW to 212th Street SW.
- 212th Street SW: WSDOT stormwater ponds are present on either side of I-5 just north of 212th Street SW.
- Lynnwood Transit Center: WSDOT media filter drains are present east of 52nd Avenue West to about 209th Street SW. A WSDOT stormwater pond is present on the west side of I-5 in the vicinity of 206th Street SW. There are also three City of Lynnwood municipal stormwater vaults and a municipal stormwater pond in the southern portion of the Lynnwood Transit Center.

HYDROLOGIC SOIL GROUPS

Table I-4.9-1 summarizes the hydrologic soil group for each soil type in the study area. Soil locations are shown on Figure I-4.9-1.



Path: K:\gis\3164_soundtransit\5543164021_NCorrPh2\Ph6\060509_WaterResources\Fig4-9-2- Soils_SurfaceWaterResources.mxd

Figure I-4.9-1
Study Area Soils

Table I-4.9-1. Study Area Soils

Map Code	Soil Description
Hydrologic Soil Group A: High Infiltration	
17	Everett gravelly sandy loam, 0 to 8 percent slopes
18	Everett gravelly sandy loam, 8 to 15 percent slopes
19	Everett gravelly sandy loam, 15 to 25 percent slopes
26	Indianola loamy sand, 15 to 25 percent slopes
Qal	Alluvium, mostly sand/gravel stream deposits. Some silt, clay, organics
Qe	Esperance sand, medium to coarse
Qvr	Recessional outwash deposits-Stratified sand and gravel
Qyal	Younger alluvium, mod sorted cobble gravel, pebbly sand, and sandy silt
Hydrologic Soil Group B: Moderate Infiltration	
Qvi	Ice-contact deposits. Similar to Qvr, less well sorted, silt-rich, contains pods of till.
Hydrologic Soil Group C: Low Infiltration	
1	Alderwood gravelly sandy loam, 2 to 8 percent slopes
2	Alderwood gravelly sandy loam, 8 to 15 percent slopes
3	Alderwood gravelly sandy loam, 15 to 25 percent slopes
4	Alderwood-Everett gravelly sandy loams, 25 to 70 percent slopes
5	Alderwood-Urban land complex, 2 to 8 percent slopes
6	Alderwood-Urban land complex, 8 to 15 percent slopes
27	Kitsap silt loam, 0 to 8 percent slopes
28	Kitsap silt loam, 8 to 25 percent slopes
29	Kitsap silt loam, 25 to 50 percent slopes
Qpf	Pre-Fraser - silt, sand, gravel; heterogenious grain size, mainly gray silt
Qpog	Pre-Olympia - silt, sand, graveL, sparce till.
Qva	Advance outwash deposits, well-sorted sand and gravel with silt, dense
Qvt	Till, compact/dense silt, sand, and gravel, 1 m to 10 m thick
Hydrologic Soil Group D: Wet Soils	
32	McKenna gravelly silt loam, 0 to 8 percent slopes
34	Mukilteo muck
39	Norma loam
51	Probable quarry pit
69	Terric Medisaprists, nearly level
78	Urban land
ml	modified land
Qcl	Clay of unknown age, compact, some silt.
Ql	Lake deposits, silt/clay with local peat and other organics
Qp	Peat, organics. Some sand, silt, clay, ash from swamps and bogs.
Qpff	Pre-Fraser Fine - silt and clay
Qpfn	Non-glacial Pre-Fraser - peat and other organics
Qw	Whidbey formation, wetland deposits. Medium sand, silt, clay, well sorted. Non-glacial floodplain deposits.

Sources: Booth et.al. 2009, King County 2004, NRCS 2012, Smith 1975

FLOODPLAINS

Jurisdictional flood zones in the study area are defined as follows:

- Federal Emergency Management Agency (FEMA): Defines areas with flood risks as geographic areas having an annual risk of flooding of 1 percent (100-year floodplain) or 0.2 percent (500-year floodplain) (FEMA 2011).
- King County: Designates Flood Hazard Areas as any land that would be inundated by the 100-year flood and/or channel migration (King County Code [KCC] § 21A.06).
- Snohomish County: Designates Special Flood Hazard Areas as 100-year floodplain identified on FEMA's 2005 Flood Insurance Rate Maps (Snohomish County Code [SCC] § 30.65).
- City of Seattle: Designates Special Flood Hazard Areas as 100-year floodplain identified on FEMA's 1995 Flood Insurance Rate Maps (Seattle Municipal Code § 25.06).
- City of Shoreline: Regulates the 100-year floodplain identified on FEMA's most recent Flood Insurance Rate Maps in addition to floodplains identified in recent flood insurance studies for Thornton Creek and the Puget Sound shoreline (currently under FEMA review and subject to regulation upon FEMA adoption); also regulates Zero-Rise Floodway defined as the channel of a stream and that portion of the adjoining floodplain that is necessary to contain and discharge the base flood flow without any measurable increase (equal to or greater than 0.01 foot) in flood height (Shoreline Municipal Code § 13.12).
- City of Mountlake Terrace: Regulates activities in the 100-year floodplain identified on FEMA's most recent Flood Insurance Rate Maps; 100-year floodplains established by comprehensive drainage plans, observed areas of localized flooding, or where the Community and Economic Development Department has determined that drainage or erosion conditions present an imminent potential of harm to the welfare and safety of the surrounding community (Mountlake Terrace Municipal Code § 16.20).
- City of Lynnwood: Designates Special Flood Hazard Areas as 100-year floodplain identified on FEMA's most recent Flood Insurance Rate Maps (Lynnwood Municipal Code § 16.46).

APPLICABLE REQUIREMENTS

Water Resource Regulations

The federal, state, and local regulations that govern the protection or use of water resources in the study area are listed below. Local plans and/or policies that guide the use of water resources in the study area are also included.

- National Environmental Policy Act, 42 United States Code (USC) Section 4321
- Clean Water Act, 33 USC 1251 et seq., Sections 401, 402, and 404

- Coastal Zone Management Act, 16 USC 1451 et seq.
- Floodplain Management Presidential Executive Order 11988
- Safe Drinking Water Act, 42 USC 300 et seq., Chapter 6A
- Washington State Environmental Policy Act, Washington Administrative Code (WAC) 197-11 and WAC 468-12
- Washington State Water Quality Standards for Surface Waters, WAC 173-201A
- Washington State Water Quality Standards for Ground, WAC 173-200
- Washington State Flood Control Management Act, Revised Code of Washington (RCW) 89
- Washington State Water Pollution Control Act, RCW 90.48
- Washington State Shoreline Management Act, RCW 90.58, WAC 173-26
- King County Surface Water Management, Title 9 KCC
- King County Groundwater Protection, KCC 9.14
- King County Critical Areas, KCC 21A.24
- King County Shoreline Management, Title 25 KCC
- Snohomish County Water Pollution Control, SCC 7.53
- Snohomish County Water Quality Restoration and Water Quantity Management, SCC 25A
- Snohomish County Shoreline Management, SCC 30.44
- Snohomish County Critical Areas Regulations, SCCs 30.62, 30.62A, 30.62B, and 30.62C
- Snohomish County Drainage, SCC 30.63A
- Snohomish County Land Disturbing Activity, SCC 30.63B
- Snohomish County Low Impact Development, SCC 30.63C
- Snohomish County Groundwater Protection, SCC 30.64
- Snohomish County Special Flood Hazard Areas, SCC 30.65
- Swamp Creek Urban Growth Area Drainage Needs Report, including Scriber Creek Subbasin (Snohomish County 2002)
- City of Lynnwood Stormwater Management, Lynnwood Municipal Code 13.40
- City of Lynnwood Surface Water Quality, Lynnwood Municipal Code 13.45
- City of Lynnwood Flood Hazard Area Regulations, Lynnwood Municipal Code 16.46

- City of Lynnwood Environmentally Critical Areas, Lynnwood Municipal Code 17.10
- City of Mountlake Terrace Shorelines Management Act, Mountlake Terrace Municipal Code 16.10
- City of Mountlake Terrace Critical Areas, Mountlake Terrace Municipal Code 16.15
- City of Mountlake Terrace Requirements for Controlling Stormwater Runoff from New Development, Redevelopment, and Construction Sites, Mountlake Terrace Municipal Code 16.20
- City of Seattle Stormwater Code, Seattle Municipal Code 22.8
- City of Seattle Floodplain Development, Seattle Municipal Code 25.06
- City of Seattle Environmentally Critical Areas Regulations, Seattle Municipal Code 25.09
- City of Shoreline Surface Water Utility, Shoreline Municipal Code 13.10
- City of Shoreline Shoreline Management Plan, Shoreline Municipal Code 16.10
- City of Shoreline Critical Areas, Shoreline Municipal Code 20.80
- Thornton Creek Watershed Plan (R.W. Beck 2009)
- Thornton Creek Draft Watershed Action Plan (Thornton Creek Watershed Management Committee 2001)
- Greater Lake Ballinger/McAleer Creek Watershed Study Draft Strategic Action Plan (Otak et al. 2009)

Water Resource Permits

Permits related to water resources that may be anticipated or incorporated as part of the project include the following:

Federal

- Clean Water Act, Section 401 – Washington State Department of Ecology
- Clean Water Act, Section 404 and Section 10 – U.S. Army Corps of Engineers

State and County

- Hydraulic Project Approval – Washington Department of Fish and Wildlife
- Aquatic Use Authorization: Aquatic Lease – Washington Department of Natural Resources
- National Pollutant Discharge Elimination System (NPDES) Stormwater Discharge Permit – Washington State Department of Ecology

- NPDES Construction Stormwater General Permit – Washington State Department of Ecology
- Temporary Modification of Water Quality Criteria – Washington State Department of Ecology
- Water Quality Certification: Section 401 – Washington State Department of Ecology
- Waste Discharge Permit for discharge of construction water to the sanitary sewer – King County

Cities

- Construction Permits – Cities of Seattle, Shoreline, Mountlake Terrace, and Lynnwood
- Development Permits – City of Lynnwood

Other

- Pipeline and Utility Crossing: Permits – Utility Providers
- Utility Approvals: Easements and Use Agreements – Utility Providers

BEST MANAGEMENT PRACTICES

Long-Term Operations

The proposed stormwater management for the Lynnwood Link Extension follows the Sound Transit *Design Criteria Manual* (Sound Transit 2012), which requires stormwater design for Sound Transit projects to conform to the requirements of the local jurisdictions. The Lynnwood Link Extension would comply with the following local design manuals:

- WSDOT: WSDOT *Highway Runoff Manual* (WSDOT 2014)
- City of Seattle: City of Seattle *Flow Control and Water Quality Treatment Technical Requirements Manual*, *Volume 3* (City of Seattle 2009)
- City of Shoreline: 2012 Ecology *Stormwater Management Manual for Western Washington* (Ecology 2012); *Engineering Development Manual* (City of Shoreline 2012); *Low Impact Development, Technical Guidance for Puget Sound* (latest version)
- City of Mountlake Terrace: 2012 Ecology *Stormwater Management Manual for Western Washington* (Ecology 2012)
- City of Lynnwood: 2005 Ecology *Stormwater Management Manual for Western Washington* (Ecology 2005) (expected to adopt the 2012 manual by the time project design is underway)

Based on the guidance provided in the *Design Criteria Manual,* low impact development (LID) is a preferred stormwater management method and would be employed wherever possible. Also, the 2012 Ecology *Stormwater Management Manual for Western Washington* requires LID approaches to stormwater management to the

extent feasible. Stormwater management facilities will be designed using sustainable, LID approaches where possible, referencing the above manuals and the Puget Sound LID Manual (WSU and Puget Sound Partnership 2012) as guidance. However, in areas where use of LID measures is not feasible due to physical site constraints, other techniques may be used. Stormwater flow control techniques may include detention ponds, infiltration ponds, vaults, and dispersion. Water quality treatment techniques may include bioretention, ecology embankments, and media filter vaults. Treatment to remove metals, oil, and grease would be provided at parking lots and roadway areas where required. A detailed discussion of the requirements applied and the proposed facilities is presented in the *Lynnwood Link Extension Conceptual Design Report - Appendix G: Drainage Plan Report Technical Memorandum* (Sound Transit 2012).

Construction

The risk of construction-related impacts to water resources would be controlled by complying with the NPDES Construction Stormwater General Permit process; the standards presented in the WSDOT *Highway Runoff Manual*, Seattle's *Stormwater Manual*, and Ecology's *Stormwater Management Manual for Western Washington*; and best management practices (BMPs), as appropriate. If discharge of treated construction or process water to a sanitary sewer is proposed, approval must be obtained from the the appropriate jurisdiction. King County's Industrial Waste Division has jurisdiction over the western portion of King County and a small area of southwestern Snohomish County. In the Snohomish County portions of the study area, discharge from Mountlake Terrace and a portion of the city of Edmonds is collected by the King County Industrial Waste Division. Discharge from within the city of Lynnwood is treated by the Lynnwood Wastewater Treatment Division. For construction within and over streams or other water bodies, a Hydraulic Project Approval (HPA) would be obtained from the Washington Department of Fish and Wildlife (WDFW) before work begins.

Through compliance with these requirements, an approved Construction Stormwater Pollution Prevention Plan (CSWPPP) would be developed and implemented for the proposed project. The CSWPPP would serve as the overall construction stormwater mitigation plan by describing overall procedural and structural pollution prevention and flow control BMPs, including location, size, maintenance requirements, and monitoring. An Ecology-certified erosion and sediment control lead (CESCL) would be employed to conduct compliance inspections. In addition, the CSWPPP would include each of the following elements:

- Temporary Erosion and Sediment Control – This element would outline the design and construction specifications for BMPs to be used to identify, reduce, eliminate, or prevent sediment and erosion problems.
- Spill Prevention, Control, and Countermeasures – This element would outline requirements for and implementation of spill prevention, inspection

protocols, equipment, material containment measures, and spill response procedures.

- Concrete Containment and Disposal – This element would outline the management, containment, and disposal of concrete debris, slurry, and dust, and discuss BMPs that would be used to reduce high pH levels.
- Dewatering Management – This element would outline procedures for pumping groundwater away from the construction area, and storing (as necessary), testing, treating (as necessary), and discharging or disposing of the dewatering water.
- Fugitive Dust Control – This element would outline measures to prevent the generation of fugitive dust from exposed soil, construction traffic, and material stockpiles.

Potential BMPs include the following:

- Phasing the work in an effort to minimize the area of impact
- Minimizing the amount of cleared area at a construction site
- Stabilizing construction entrances and haul roads using quarry spalls
- Washing truck tires at construction entrances, as necessary
- Constructing silt fences downslope from exposed soil
- Protecting catch basins from sediment
- Containing and controlling concrete and hazardous materials on site
- Installing temporary ditches to route runoff around or through construction sites, with periodic straw bales or rock check dams to slow and settle runoff
- Providing temporary plastic or mulch to cover soil stockpiles and exposed soil
- Using straw wattles to reduce the length of unbroken slopes and minimize runoff concentration
- Using temporary erosion control blankets or mulch on exposed steep slopes to minimize erosion before vegetation is established
- Constructing temporary sedimentation ponds to remove solids from concentrated runoff and dewatering before being discharged
- Conducting vehicle fueling and maintenance activities no closer than 100 feet from a water body or ditch
- Implementing stream protection measures, as necessary, including diverting stream flow around the construction area and limiting the construction period to the required "work window," a period of the year identified in the HPA when fish would be minimally affected

IMPERVIOUS SURFACE CHANGES

A quantitative estimate of proposed impervious surface was calculated in an area extending out 100 feet from the right-of-way boundaries along each alternative alignment and the proposed light rail stations (see Figure I-4.9-2). The calculations included the areas of the alternatives only and did not include options. Table I-4.9-2 compares total proposed impervious surface for the Preferred Alternative and other alternatives in Segments A, B, and C that would potentially result in the highest and lowest amount of new impervious surfaces, compared to total existing impervious surface in the same area.

Table I-4.9-2. Proposed Changes in Impervious Surfaces

Project Alternative	Total Existing Impervious (acres)			Total Impervious After Project (acres)			Percent Change		
	PGIS[a]	NPGIS[b]	Total	PGIS[a]	NPGIS[b]	Total	PGIS[a]	NPGIS[b]	Total
Segment A: Seattle to Shoreline									
Preferred Alternative: At-grade/Elevated with NE 145th and NE 18th Street Stations	79	11.28	90.28	82.55	38.26	120.81	4%	239%	34%
A1: At-grade/Elevated with NE 145th and NE 185th Street Stations (maximum of other alternatives)	79	11.28	90.28	81.84	38.00	119.85	4%	237%	33%
A3: Mostly Elevated with NE 145th and NE 185th Street Stations (minimum)	79	11.28	90.28	78.80	37.97	116.78	0%	237%	29%
Segment B: Shoreline to Mountlake Terrace									
Preferred Alternative (B2 Modified): East Side to Mountlake Terrace Transit Center to West Side	63.8	4.89	68.69	63.46	22.53	85.99	-1%	361%	25%
B2A: East Side to Mountlake Terrace Transit Center to West Side with 220th Street SW Station (maximum)	63.8	4.89	68.69	62.91	23.57	86.47	-1%	382%	26%
B4: East Side to Mountlake Terrace Freeway Station to Median (minimum)	63.8	4.89	68.69	60.24	19.95	80.20	-6%	308%	17%

Table I-4.9-2. Proposed Changes in Impervious Surfaces

Project Alternative	Total Existing Impervious (acres)			Total Impervious After Project (acres)			Percent Change		
	PGIS[a]	NPGIS[b]	Total	PGIS[a]	NPGIS[b]	Total	PGIS[a]	NPGIS[b]	Total
Segment C: Mountlake Terrace to Lynnwood									
Preferred Alternative (C3 Modified): Along 1-5 to Lynnwood Park-and-Ride Station	55.47	11.32	66.79	53.42	17.1	70.52	-4%	51%	6%
C2 Option 2: 52nd Avenue West to Lynnwood Transit Center with Option 2 West Connection (maximum of other alternatives)	55.47	11.32	66.79	52.81	17.47	70.27	-5%	54%	5%
C1 Option 1: 52nd Avenue West to 200th Street SW (minimum)	55.47	11.32	66.79	52.68	16.76	69.44	-5%	48%	4%

[a] PGIS: pollution-generating impervious surfaces, which include parking areas, bus holding areas, project-associated roads or road realignments, and maintenance facilities

[b] NPGIS: non-pollution-generating impervious surfaces, which include light rail tracks and stations

APPENDIX I-4.11

Geology and Soils

APPENDIX I-4.11 GEOLOGY AND SOILS — BACKGROUND INFORMATION

Table I-4.11-1. Summary of Geologic Units and Engineering Properties

Geologic Unit (Map Symbol)	Description	General Constructability	Density and/or Hardness	Strength	Permeability	Liquefaction Potential
Modified land	Fill and/or graded natural soils that obscure or alter the original soils; not mapped or shown on map legend, because entire I-5 corridor could potentially be shown as modified land	Varying. Poor foundation support and poor cut stability if non-engineered, good foundation support and cut stability if engineered	Variable	Variable	Variable	High
Wetland deposits (Qw)	Organic-rich sediment, peat and fine-grained alluvium deposited in and around wetlands; not all deposits mapped	Poor foundation support, poor cut stability, high occurrence of groundwater, poor soils for reuse as engineered fill	Very soft to medium stiff	Low	Variable	High
Peat (Qp)	Organic matter and woody debris, often accumulated in the floors of recessional outwash channels, commonly interbedded with silt and clay; not all deposits mapped	Poor foundation support and poor cut stability; highly compressible	Very soft to medium stiff	Very low	Medium	Low
Younger alluvium (Qyal)	Sand with variable silt content and silt with occasional layers of organic matter, deposited by streams and running water; not all deposits mapped	Poor to fair foundation support, depending on composition, density and construction type; some soils might be wet-weather sensitive; some soils might be suitable for reuse as engineered fill, depending on fines content	Loose to medium dense or soft to stiff	Low to medium	Low to high	High

Geologic Unit (Map Symbol)	Description	General Constructability	Density and/or Hardness	Strength	Permeability	Liquefaction Potential
Vashon recessional outwash deposits (Qvr)	Layered sand and gravel with minor silt and clay layers deposited in outwash channels emanating from retreating glaciers as well as in and adjacent to recessional lakes.	Fair to good foundation support and stable cuts when undisturbed, unless below the water table or exposed to water; potential groundwater occurrence; soils suitable for reuse as engineered fill	Loose to dense	Low to medium	Medium	Medium
Vashon glacial till (Qvt)	Non-sorted mixture of clay, silt, sand, gravel, cobbles, and boulders deposited along the base of the Vashon glacial ice. The upper 2 to 5 feet is often weathered. These materials are generally heterogeneous, yet often exhibit considerable variation in composition over short distances	Excellent foundation support and stable cuts when undisturbed; perched groundwater sometimes encountered; wet-weather sensitive, soils suitable for reuse as engineered fill depending on moisture content	Medium dense to very dense	High	Low	Low
Advance outwash (Qva)	Stratified sand with gravel and some cobbles deposited by streams emanating from advancing glaciers and subsequently glacially consolidated. Advance outwash deposits typically contain relatively low fines content. However, locally, the advance outwash can be silty and contain layers of fine-grained sands and silts.	Excellent foundation support and stable cuts when undisturbed, unless below the water table or exposed to water; potentially high groundwater occurrence; soils suitable for reuse as engineered fill	Dense to very dense	High	Medium to high	Low

Geologic Unit (Map Symbol)	Description	General Constructability	Density and/or Hardness	Strength	Permeability	Liquefaction Potential
Lawton clay (Qvlc)	Thick sections of clay and silt and fine sand and some layers of peaty sand deposited in proglacial lakes and subsequently glacially consolidated; not mapped but likely present below advance outwash	Good foundation support when undisturbed, cuts potentially unstable if previous slope movement has occurred; low groundwater occurrence; poor soils for reuse as engineered fill	Medium stiff to hard	Medium to high	Low	Low

APPENDIX I-4.12

Hazardous Materials

APPENDIX I-4.12 HAZARDOUS MATERIALS — BACKGROUND INFORMATION

Potential Acquisition Issues

Acquisition of property where recognized environmental conditions (RECs) have been identified can result in or a need for further action by the purchaser (i.e., Sound Transit). Issues can include:

1) restriction in current or future property use;
2) incurring costs for cleanup;
3) schedule delays;
4) worker and public safety; and/or
5) increased resource agency oversight.

Sound Transit routinely investigates the previous ownership and uses of a property as well as its conditions prior to an acquisition, which helps safeguard and manage potential liability issues. In this way, RECs are disclosed prior to the sale of the property and potential issues can be mitigated prior to construction activities. Inquiry may result in responsibility for cleanup by the owner/operator and/or reduction in the property's value.

Additional investigations and other due diligence may be conducted prior to property acquisition. A Phase I ESA conducted consistent with ASTM 1527-05, or equivalent, could be performed for an industrial or commercial property that is planned for acquisition. A Phase I ESA would include activities such as on-site inspections and interviews with property owners and operators, activities that are not standard practice in developing Draft EIS documents. Acquiring temporary or permanent easements may also require some level of due diligence.

Additional investigation may be necessary to establish the presence or absence of contamination to satisfy due diligence requirements under federal law and to qualify for landowner liability protections. Assessment would also help in the determination of potential cleanup actions and cost. The conduct of these additional assessments is considered sufficient to mitigate agency liability as described in Section 4.12.8.

INTRODUCTION

This briefing book evaluates the light rail route and station alternatives along I-5 between the Northgate and the Lynnwood Transit centers that are being considered for further design and analysis in the Draft Environmental Impact Statement (DEIS). Staff will brief the Sound Transit Board Capital Committee at their April 12th meeting and seek identification of the light rail alternatives to be included in the DEIS at the Board meeting on April 26, 2012.
